What Should Governments Do?

Sunil Mani

This paper attempts to demonstrate that while the developing countries are trying to pare down the role of their governments in economic matters, the developed countries are putting in place a number of support measures to help their private sectors to commit more resources to R and D. The efforts of the US and the OECD governments are examined to show how they are articulating proactive public innovation policies.

THE reduction of the discretionary role of government is an important component of public policy-making in economies across the world, both developed and developing. The more explicit articulation of this policy is to be seen in the policy with respect to privatisation and deregulation. A less virulent but nevertheless important part of this policy package is the conscious reduction of governmental intervention (read governmental support in some countries where the former term is not considered to be politically correct) in all matters of economic activity. However there are some areas where such intervention or support cannot be wished away or is even a *sine qua non*. Even the more virulent supporters of economic liberalisation, such as the World Bank.[1] have no hesitation in agreeing that certain activities like education and health cannot be left entirely with the market as these are typically the areas where known market failures are significantly greater than known government failures. To this list (which seems to be ever burgeoning) is added the area of industrial R and D. The most recent World Development Report of the Bank titled *Knowledge for Development* argues quite forcefully that "Governments in many countries have played a large role in the development and application of technology...In the past 50 years, among the handful of economies that have come a long way toward closing the knowledge gap with the global technological leaders, government was active in several, including Japan, Korea, and Taiwan, China. Korea followed a strongly interventionist and nationalist route, keeping FDI to a minimum and relying on other modes of technology transfer and a concerted domestic technological effort" [2] Similarly Joseph Stiglitz, (vice president and chief economist of the World Bank) also argues in his recent UNU/WIDER lecture[3] that " Left to itself, the market under provides technology. Like investments in education, investments in technology cannot be used as collateral. Investments in R and D are also considerably riskier than other types of investment and there are much larger asymmetries of information that can impede the effective workings of the market. Technology also has enormous positive externalities that the market does not reward. Indeed, in some respects, knowledge is like a classical public good. The benefits to society of increased investment in technology far outweigh the benefits to individual entrepreneurs. As Thomas Jefferson said, ideas are like a candle, you can use them to light other candles without diminishing the original flame. Without government action there will be too little investment in the production and adoption of new technology".

The Nobel laureate, Kenneth Arrow has argued very forcefully in a much-quoted papor that industrial R and D cannot be left entirely to the private sector. According to Arrow, R and D investment results in the creation of formalised knowledge. But the public good nature of knowledge makes it impossible for its generator to appropriate the full returns from this activity. This is known as knowledge spilllovers. The existence of knowledge spillovers encourages private economic agents to under invest (than is warranted by the social optimum) in R and D. Larger the spillovers, larger will be the desire to under invest. Subsequent empirical analyses by other economists have quantified the size of these spillovers for a sample of innovations across a large number of countries. Invariably the knowledge spillovers are sufficiently large even in purely market economies, which have very strong patenting regimes. In order to offset for possible under investment, governments across the western world have designed and put into effect various R and D subsidy schemes and other support measures.[4] These are normally contained in what is termed as public innovation or technology policies.

There has been a renewed interest in the role of government with respect to technology development. And this renewed interest has been warranted by the recent slowdown in business enterprise R and D across the developed countries (Figure 1). In fact the business enterprise R and D has not only slowed down, its rate of growth has become negative focusing once again on support measures to reverse this negative trend.

In the following we attempt to demonstrate that while the developing countries are attempting to pare down the role of government in economic matters, often enough blindly in response to external pressures such as those from being a member of the WTO, the developed countries are putting in place a number of support measures that can help their private sector to commit more resources to R and D. I accomplish this by examining in some detail the efforts of the US and OECD governments in articulating much more proactive public innovation policies. I begin with the US case.

The US Case

No other country in the world had such effective governmental support for industrial R and D as the US. There is a consensus that much of America's technological leadership since 1945 is stimulated by Federal R and D spending. Some prominent spin offs of governmental R and D efforts include: automated air traffic control, microwave ovens, biotechnology industry, integrated circuitry, commercial satellite communications, jet aircraft, satellite-based global navigation and communication, super computer and the internet

Some of these items like the internet or microwave ovens are now much used in our daily lives. Little does one realise that these technologies would not have existed had the government not initiated these projects. The importance that US attaches to technology policy can be gauged from the following four indicators.

- The so-called complementarity between Federal investments in R and D and private sector investments.
- The position of the US with respect to the R and D subsidies code in the Uruguay round of trade negotiations.

FIGURE 1: WORLD SLOWING DOWN IN BUSINESS ENTERPRISE R AND D

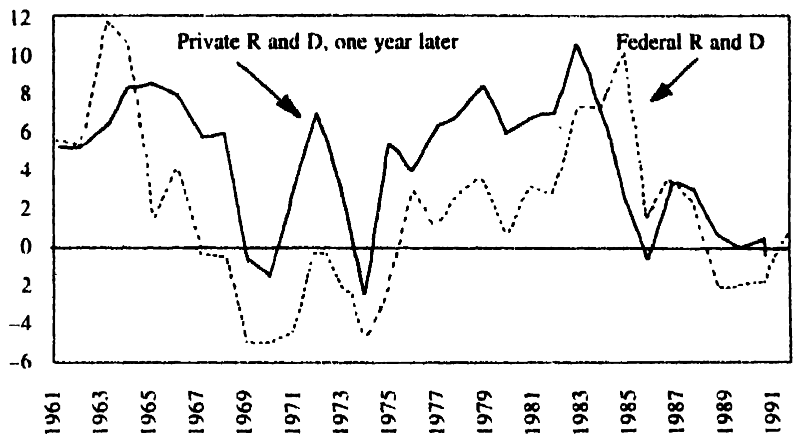
FIGURE 2: COMPLEMENTARY RELATIONSHIP BETWEEN FEDERAL AND PRIVATE SECTOR R AND D EXPENDITURES IN THE US



Source: Hill (1995).

- Evolution of US technology policy with its emphasis on federal technology partnership programmes.
- Direct fiscal incentives for industrial R and D

I discuss each of these issues seriatim.

Complementary Relationship between Federal R and D and Private Sector R and D: According to a report prepared by the Council of Economic Advisers (1995), any reduction in federal R and D will result in a reduction in private sector R and D expenditures. Empirical justification for this statement is provided by the study of Hill (1995) who established, graphically, a lagged positive correlation between changes in federal and private sector R and D expenditures (Figure 2). The rationale for this complementary relationship is based on the argument that as government makes more contract R and D money available to industry, firms increase their own R and D spending in hope of capturing more government funds. Industry spending also may follow federal spending patterns in order to position themselves to take greater advantage of anticipated spin-offs from the government R and D programmes.

The position of the US with respect to the R and D subsidies code in the Uruguay round of trade negotiations: The issue that the US government provides (and quite justifiably so) a variety of subsidies for R and D is very clearly evident in the text of the statement by John H Gibbons[5] (director, Office of Science and Technology Policy) before the House Subcommittee on Technology, Environment and Aviation. The statement referred to the official position of the US with respect to the R and D subsidies code contained the erstwhile Dunkel draft text of the GATT Subsidies Code. It is clear from the statement by Gibbons that:

- The US relies heavily on central government R and D support than the Japanese or the Europeans.
- The original Dunkel text would have created a *green light* category of non-actionable R and D subsidies. However in order to be protected, the government contribution could not exceed 50 per cent for basic industrial research or 25 per cent for applied research. This formulation was particularly bad for US technology policy because its investments in applied research is generally made in a 50-50 partnership with industry. This level of assistance exceeded the Dunkel limits and would have left many of the country's R and D programmes subject to challenge.
- As a result of strong negotiations by the US team these limits were revised upwards. Industrial research, planned with the idea of some commercial application down the road, may receive as muct as 75 per cent government suppori without challenge. Pre-competitive development activity, up to developmen of the first non-commercial prototype can be funded with equal shares fron government and industry.

The fact that the US lobbied within the Uruguay round of trade negotiations to effect an upward revision of the degree of subsidisation is itself a clear indicatioı of the importance that it attaches to publi innovation policies.

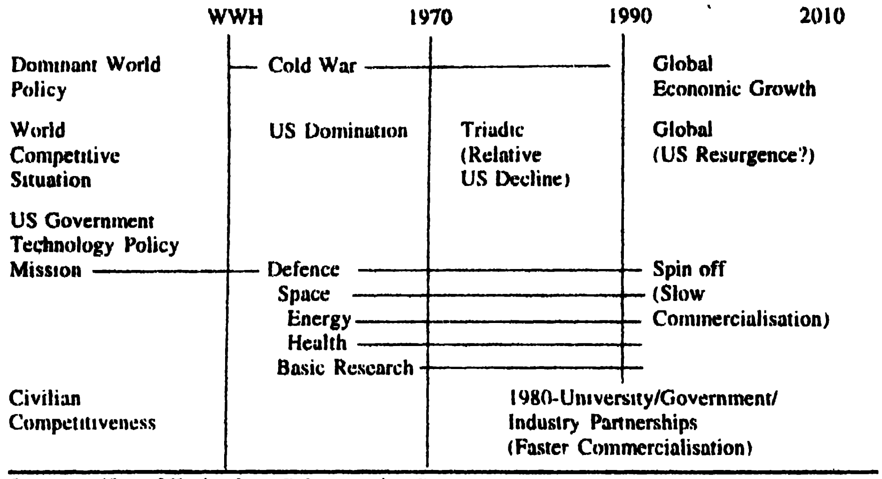
Evolution of the US technology polic with its emphasis on federal technolog partnership programmes: The US govern ment has always relied on a number o rather sharply focused instrument an institutions to effect technical chang within industry. Nelson (1988) provide a succinct summary of these. The federa government's policy with respect t technology development and its assimi lation have undergone substantial changes A chronological tracing of the govern ment's technology policy is mapped ou in Figure 3.

I now concentrate on the more contem porary period or, in terms of the classi fication in Figure 3, the period sinc 1988. This phase is also referred to as th *new paradigm* in technology policy. Th new paradigm involves an effectiv partnership with private sector industr In sharp contrast to enhanced spin-o programmes – enhancements that made easier for the private sector to com mercialise the results of mission R and I – the federal government actively devel oped a number of new public-privat partnerships to develop and deploy ad vanced technologies. There are five suc partnership programmes:

- Co-operative Research and Develop ment Programmes (CRADAs).
- Small Business Innovation Researc Programme (SBIR).
- Advanced Technology Programm (ATP).

FIGURE 3: THE US TECHNOLOGY POLICY IN HISTORICAL PERSPECTIVE

Evolution of US Technology Policy



Source Office of Technology Policy (undated).

– Manufacturing Extension Programme (MEP).
– Technology Reinvestment Project (TRP).

The main features and financial implications of these are summarised in Table. It is clear from the table that much of the support is in the form of intangibles, quite important in their own right.

Of the various partnership programmes, it is the ATP, which has come in for much discussion as this involves flows of financial resources from the Federal government to the private sector. Most evaluations of this programme[6] show that it has been very successful and are fairly unanimous in pointing out that had there been no financial support, the private sector would not have taken up the large projects on its own.

Tax incentives for increasing industrial R and D: There are two such schemes. Since 1954, industry has been able to deduct the full costs of R and D from income before taxes in the year in which they were incurred, while depreciating the costs of facilities and major equipment. Second, in 1981 with the passage of the Economic Recovery Tax Act of 1981, a series of special tax credits have been offered to firms that increase their R and D expenditure above previous levels. The effectiveness of these tax incentives to spur increased R and D investments has been a subject of many debates, both in government and academic circles. Mani (1999)provides a detailed summary of these various studies. Suffice it to stay that the evidence on this count is far from clear, but carefully done studies point to its effectiveness. Hence there has been calls for making the tax credit scheme a permanent one.

However as noted earlier the federal support for overall R and D has shown significant declines in recent times and given the so-called complementary relationship between private and federal R and D, this has lead to declining investments in R and D by the private sector too. This is corroborated by the recent exercise of Porter and Stern (1999).[7] According to the new innovation index[8] America's capacity for innovation grew strongly in the 1980s and peaked around 1989, driven by strong increases in R and D spending, workers employed in science and technology, education spending, and GDP per capita. Since 1989, however, the US index has been flat or falling, and is currently below the level for 1978. The

TABLE: KEY FEATURES OF FEDERAL PARTNERSHIP PROGRAMMES

	Co-operative Research and Development Agreement (CRADA)	Small Business Innovation Research (SBIR)	Advanced Technology Programme (ATP)	Manufacturing Extension Programme (MEP)	Technology Reinvestment Project (TRP)
Project selection basis	The private sector partners are free to propose a research collaboration in area within the scope of a federal government lab's research mission	Government chooses mission topics on which it will consider proposals; applicants then propose specific projects.	All research areas are open to industry proposals involving high-risk enabling technology Selection of proposals for funding is made by National Institute of Standards and Technology on the basis of extensive peer review of technical and economic issues.	MEP Centres provide help to all SMEs who seek it.	Focuses on technology development and deployment issues of importance to the defence mission
Government Financial Assistance	The labs may contribute human and physical resources to the collaborative project but may not directly contribute any funds As general matter, the lab contributes no more than 50 per cent of the total cost of collaboration	The funding agency pays the costs of the project, up to $ 1,00,000 for Phase I projects and up to $ 7,50,000 for Phase II projects	Agency award co-operative agreements with required cost-sharing	The entire programme consists of non-financial assistance	Co-operative agre... with required cost-sharing
Non financial Support	Technical collaboration is the mainstay of the agreement	None	Value added project oversight and technical support	do	Project oversight and technical support

drop in spending on R and D and education and a decline in the relative international openness of the US economy are identified as the causative factors. Based on the trends identified by the index, Porter and Stern predict that the US stands to fall from the first place in 1996 to sixth place by year 2006.

THE OECD CASE

It is clear from Figure 1 that Europe too has experienced a significant slow down in R and D investments. In fact according to Eaton, Gutierez and Kortum (1998) a possible explanation for the lacklustre economic performance of Europe may be to its research performance. The simulation exercises conducted by the authors show that achieving a 10 per cent rise in the average level of EU income would require a permanent research subsidy of around 4.9 per cent.

A recent OECD study titled *Public Support to Industry* has identified that the governments in these countries have been supporting technology creation and development through essentially three direct instruments, namely:

- Direct financing measures to support R and D activities of manufacturing enterprises.
- Civilian and defence-related R and D contracts.
- Support to intermediary R and D institutions.

The flow of financial resources from the government to the private sector on the above three counts are mapped out in Figure 4. It is seen that the direct support to R and D is the fastest growing category: the temporary dip in 1993 is attributed to reporting gaps. And within the direct support category about 60 per cent is made up of research grants. This is quite significant as even in the free market economies direct financial support for R and D in the form of research grants is becoming more popular than indirect support measures such as tax concessions, etc.

Among the OECD economies, it has been the UK which has systematically reduced the importance of government with respect to financing of civilian industrial R and D (Figure 5). Government financing of civilian industrial R and D has declined in real terms and so it is not surprising that funding of R and D by business enterprises from own sources has suffered significant declines. According to Walker (1993), "the violent doctrinal swings" that have characterised the governance of the country has led to "instability in government policies". So it is not surprising that the position of UK in the league table constructed by Porter and Stern is fairly at the bottom.[9] Porter advocates, inter alia, a huge transfusion of funds into R and D and higher education for UK to reverse its unenviable transformation from being an innovator to an imitator (again according to Porter). In order to reverse the trend, Porter would like Britain to organise "high-powered incentives" to aid entrepreneurs. No doubt this is a dreadful comment for a country which has been at the forefront of the industrial revolution during the last two centuries.

This apparent retrogression of the UK's national innovation system is an important pointer to other countries, both in the developed and developing world, which attempt blindly to reduce the role of government with respect to supporting industrial R and D.

Refreshingly there is a clear recognition of this increased role for government with respect to industrial R and D in the analytical report to the recently released *White Paper on Competitiveness*.[10] The report makes the following statement with respect to the role of government:

> There is an important role for government in ensuring that our science and engineering base and our ICT infrastructure continues to strengthen. Government has a role in encouraging investment in basic science, which may not have immediate commercial application, and in fostering investment in new technology where the risks may be too great for a single firm. It also has a role in technical education, in the spread of best practice and in encouraging scientific excellence. Development of our ICT infrastructure also requires government action in establishing the right regulatory environment and setting technical standards.

However, the *White Paper* revels in ambiguity when it comes to spelling out the specifics of this role of government in terms of fiscal and other incentives. On the contrary, there is a sort of profound vagueness when it refers to a new model of public policy which helps the markets to function better.

Summing up

I have shown in the above that governments must play an important role in terms of increasing investments in R and D. This role is to be interpreted as initiating a set of policy instruments and institutions which will aid the private sector to overcome the problem of appropriability of research output and the consequent possibilities of under-investment and it will be different for basic research and applied and developmental research. As far as basic research is concerned recent events and discussions have clearly shown that there is no other alternative but for governments to shoulder this in its entirety. For instance, a recently released study by the Committee for Economic Development titled *America's Basic Research* underlines that government support for basic research is critically important. As far as applied and developmental research is concerned, governments can put in place a variety of instruments through which its actual conduct in the private sector is strengthened. These instruments consist of tax incentives to private sector to do more R and D, provision of adequate quantities of venture capital, financial aid in the organisation and maintenance of technical standards, administration of sharply focused partnership programmes in areas of high-technology and the strengthening of the higher education sector.

Given the recent growth performance and growth potential it is no longer meaningful to treat all developing countries as a homogenous bunch. The countries of East Asia, India and China, and some of the Latin American countries have relatively more advanced national systems of innovation. However even in this select group, with the exception of Korea and Taiwan, most of the countries do not have very clearly articulated instruments and institutions embodying their respective governments' forays into technology policies. A classic example is that of India where approximately one half of civilian industrial R and D is done by the private sector.[11] But whether the Indian government has a technology policy worth the name (notwithstanding the existence of so-called Technology Policy Statements) is a moot point. Singapore is usually regarded as a free market economy. But from 1991 onwards the government of that country has been busy putting in place a very sharply focused technology policy [Mani 1999]. It is not that easy to wish away a role for government with respect to the organisation and conduct of industrial R and D.

Notes

[The views expressed here are the author's own. The author wishes to thank Ad Notten for helping him with otherwise inaccessible literature.]

1 The main theme of the 1997 *World Development Report* was 'State in a Changing World'. According to the report, the first responsibility of the government lies in getting the fundamentals right Five fundamental tasks lie at the core of every government's mission, without which sustainable, shared, poverty-reducing development is impossible. These five tasks are: establishing a foundation of law, maintaining a non-distortionary policy environment, including macro-economic stability, investing in basic social services and infrastructure, protecting the vulnerable, and protecting the environment.

2 World Bank (1998), p 32.

4 For a survey of various governmental support schemes, see Mani (1999).

5 Gibbons (1994).

6 See Mani(1999) for a summary of the various studies evaluating the ATP. Also see Powell (1997) for a very detailed evaluation of the ATP

7 The innovation index by Michael Porter and Scott Stern is due to be published by the Washington-based think-tank, Council on Competitiveness by the middle of March 1999. The present account of it is based on Judge (1998).

8 The index, which ranks 17 countries annually from 1975 to 1996, attempts to explain the differences among countries by relating their international patents to six factors: (1) R and D spending by companies, universities, and government; (2) the number of R and D personnel in the workforce; (3) the share of GDP invested in education; (4) intellectual property protection; (5) GDP per capita; and (6) international openness.

9 UK ranks 13 out of a possible 17 and has high probability to end with the 15th rank by year 2006. See Marsh (1998).

10 Department of Trade and Industry (1998).

11 See Mani (1998). The share of the private sector in terms of the output of R and D in terms of number of patents taken within India is even higher at about 61 per cent.

Industrial Growth and Structure

Manufacturing Sector in Maharashtra

L G Burange

Maharashtra occupies a very significant position as far as the manufacturing sector in India is concerned. However, since 1970s the share of the secondary sector in the State Domestic Product has been stagnating around 33 to 34 per cent. Further, the state is experiencing significant changes in the industrial composition wherein capital and intermediate goods industries are becoming dominant. The manufacturing sector is itself undergoing major structural changes. Over the period 1979-80 to 1994-95 the state realised a high growth rate in fixed capital resulting in decrease in employment. The rising capital intensity and thereby substitution of capital for labour, low growth rates of output and value added, all do not indicate satisfactory performance of the state on the industrial front. However, there is a revival in the manufacturing sector in post-reform period.

I
Introduction

THE industrial scenario of India underwent fundamental change in the mid-1980s with the first round of liberalisation. The new economic policy introduced in 1991 is expected to provide a further boost to the industrial sector. After 1991 many state governments have come out with policies for promoting industries, especially through foreign direct investments. However, without discerning the trends over the years at industry level, any growth strategy, propelled by private investment, may be unduly optimistic.

Thus, industrial growth and structure at the state level has to be analysed at disaggregate level in order to evaluate industrial policies and potential for growth. In this paper efforts are made to analyse industrial structure and growth of the manufacturing sector in Maharashtra with as much disaggregation as possible. This study is divided into 11 sections. In Section II data have been discussed. Section III describes the industrial situation in the state. Section IV analyses industrial composition while Section V deals with manufacturing sector. Employment and output elasticities as well as factor intensity are discussed in Sections VI and VII respectively. The changes in structural ratios are analysed in Section VIII. Section IX tries to locate the responsible factors. The impact of liberalisation is analysed in Section 10. The last section presents conclusions.

II
Data: Adjustments and Coverage

The main data source is the Annual Survey of Industries – Summary Results for Factory Sector (ASI). There are few limitations of the data which must be noted. Firstly, the period begins with 1979-80, because in that year ASI started publishing state level data for two-digit industries; 1994-95 is the latest year for which industrywise data is available through ASI summary results. Secondly, since the analysis depends on ASI data, the limitations of the data due to collection and compilation procedures of ASI will automatically affect our analysis. To recount a few important limitations: (a) As data in respect of less than three units in an industry cannot be shown separately, the details in respect of such units have been combined with other industries (category 38); (b) In respect of non-responding factories, no estimates have been made and incorporated in this report.

Further, it is not possible to capture the growth of modern hi-tech industries like computer and information technology industry as the ASI data clubs these industries together with other industries (category 38). Unless one gets more disaggregated data, one may not be able to analyse growth of this sector which has been showing phenomenal growth from the mid-1980s in the state. The performance of 'other industries' in this analysis may be taken as a proxy for the above observation. The industries 30 and 31 have been interchanged on account of adoption of NIC-87. With appropriate adjustments in the data, we retained old NIC groups 30 and 31. The other required data are obtained from *Economic Survey of Maharashtra*, and *Monthly Bulletin* of Index Number of Wholesale Prices in India. For deflation of current values, wholesale price index with the base as 1981-82 is used. The values at constant prices are computed using the all-India WPI series, as this is not available for the state. For deflation of fixed capital, the composite price index for building material, manufacture of machinery, machine tools and parts, manufacture of electrical machinery and manufacture of transport equipments and parts are used. The fixed capital considered in the study is the Book Value of capital which is net of depreciation. Replacement value of capital would have been more appropriate but construction of such values is a major task by itself which is not attempted in this study. To deflate value of output of different industries in manufacturing sector, the industrywise wholesale price index has been used. Total emoluments to employees are deflated to base year 1981-82, using consumer price index for industrial workers. Non-emoluments part of value added is deflated by consumer price index (general). Then adding total emoluments and non-emoluments at constant prices we get value added at constant prices.

III
Industrial Situation

Maharashtra is the leading industrialised state in our country. This can be seen from the fact that in 1969-70 the state which accounts for about 9.32 per cent of population contributed 17.91 per cent of registered factories, 17.43 per cent of productive capital, 19.10 per cent employment, 32.36 per cent value of output and 26.68 per cent of value added. However, while over a period of time Maharashtra continues to remain on top of the industrial map of India, the worrisome factor is that the state's share in Indian industry is declining which indicates that the state is losing its grip on the industrial front. In 1990-91 the state contribution in terms of registered factories declined to 14.15 per cent; in terms of productive capital it was 17.13 per cent; in terms of employment it declined to 15.18 per cent; in terms of value of output it came down to 22.7 per cent and in terms of value added it declined to 23.3 per cent. This indicates that the rest of India is doing better than Maharashtra. In 1994-95 the situation has

further deteriorated (Table 1). This paper seeks to examine the industrial performance of the state for the recent period from 1979-80 to 1994-95.

The sectoral composition of 'state domestic product' also shows somewhat unsatisfactory performance in the industrial sector. Maharashtra is an agriculturally deficit state; also beyond a point the state does not have enough scope for growth in the agricultural sector. However, this is not the case with the secondary sector. The percentage share of this sector in state domestic product continuously went on increasing up to 1972-73, but since then it has remained more or less stagnant. The percentage share of primary, secondary and tertiary sectors in 1960-61 were 41.6, 26.7 and 31.7 respectively. In 1970-71 these shares were 28.6, 34.2 and 37.2, showing moderate increases in secondary and tertiary sectors and a large decline in the share of the primary sector. In 1993-94 the shares of primary and secondary sectors declined to 21.9 per cent and 32.7 per cent respectively and that of the tertiary sector increased to 45.4 per cent. In 1994-95 there is a marginal improvement (Table 2). If the annual compound growth rates of these shares are computed from 1960-61 to 1994-95, the share of the primary sector declines by 1.65 per cent per annum whereas the share of the secondary sector increases by 0.41 per cent per annum, and that of the tertiary sector by 0.92 per cent per annum. However, if annual compound growth rates of shares of these sectors are computed for the period of this study, i e, from 1979-80 to 1994-95, we notice a decline in the share of the primary sector by 2.11 per cent per annum. The share of the secondary sector also declines by 0.19 per cent per annum. Only the share of the tertiary sector increases by 1.43 per cent per annum.

IV
Industrial Composition

In the 1960s industrial activity in Maharashtra was concentrated in the production of consumer goods. Considering value added of industries in Maharashtra in 1960, we see that the consumer goods industry contributed 52 per cent while 48 per cent was accounted for by capital and intermediate goods industries. This structure has changed completely over time. In terms of value added in 1980-81, the consumer goods industry accounted for 35 per cent whereas capital and intermediate goods industries accounted for 65 per cent. In 1995-96 the consumer goods industry accounted for a mere 17 per cent, and capital and intermediate goods industries together contributed 83 per cent (Table 3).

To strengthen the above argument, industries 20-21 to 29 which are agriculture-related are aggregated and 30 to 39 which are non-agriculture-related industries clubbed [Desai et al 1994] and their relative shares are then computed from 1979-80 to 1994-95. The share of agriculture-related industries in fixed capital, employment, value added and value of output declined substantially over the period. Correspondingly, the share of non-agriculture related industries went up (Table 4). An examination of the table reveals that during the period 1986-87 to 1988-89 there appears to be a major structural transformation between agriculture-related and non-agriculture related industries. To study the concentration of industries in the state, the Hirschman Herfindahl index (HHI) is used for the manufacturing sector for the period 1979-80 to 1994-95. The HH index has been constructed for fixed capital, for number of employees, for value of output and for value added using equation (1).

$$HHI = \sum_{i=1}^{n} P_i^2/100 \qquad ...(1)$$

where P_i = percentage share of ith industry in the manufacturing sector.

Using this index one can study with this data-set the industrial concentration in manufacturing sector. HHI can be used for two-digit industrial disaggregation in the manufacturing sector. The HHI constructed for fixed capital at constant prices shows decline which implies that the concentration is decreasing in Maharashtra, i e, fixed capital is less concentrated in few industries in the state. However, after 1989-90, it went on increasing, implying that fixed capital is getting concentrated in a few industries in the state (Table 5). As long as in this case HHI is greater than 5.56, it means fixed capital is concentrated in some industries, i e, minimum value of HHI (5.56) will be obtained when the fixed capital is equally distributed in all 18 two-digit industries. The maximum value of HH index is 100 when the entire fixed capital is concentrated in one industry only in the manufacturing sector.

By the criterion of number of employees the degree of concentration is less in the state. Employment is less concentrated in the industries than is fixed capital. The trend remains more or less the same from 1982-83 onwards. In terms of value added the degree of concentration is higher than that of employment and it is increasing over the 16-year period. Similarly, in terms of value of output (real output) the degree of concentration in the manufacturing sector in the state is higher than that of employment, increasing especially after the 1990s. In case of fixed capital manufacture of food products, rubber, plastic, petroleum and coal products, manufacture of chemical and chemical products, basic metal and alloys industries and the manufacture of electrical and non-electrical

Net value added	26.68	24.60	24.87	25.88	23.30	22.75	22.01

machinery account for 67.40 per cent of fixed capital of manufacturing sector in Maharashtra. For value of output manufacture of food products, manufacture of rubber, plastic, petroleum and coal products, manufacture of chemical and chemical products, manufacture of electrical and non-electrical machinery and manufacture of transport equipments account for 69.66 per cent of the total output of manufacturing sector in the state in 1994-95. In case of net value added in 1994-95, only four industries account for 56.77 per cent of net value added in the manufacturing sector in the state. These industries are manufacture of rubber, plastic, petroleum and coal products, manufacture of chemical and chemical products, manufacture of electrical and non-electrical machinery and transport equipments (category 37). In case of employment 49.44 per cent employees of manufacturing sector in the state are in manufacture of food products, cotton textiles, rubber, plastic, petroleum and coal products and electrical and non-electrical machinery.

However, in 1979-80 the manufacture of food products, cotton textiles, chemical and chemical products, and manufacture of transport equipments together accounted for 59.24 per cent of fixed capital, 52.67 per cent of employment, 53.26 per cent of value added and 53.79 per cent of value of output of manufacturing sector in the state. The share of the same four industries in 1994-95 decreased to 29.93 per cent of fixed capital, 34.03 per cent of employment, 30.11 per cent in value added and 36.35 per cent in value of output. These are some of the major structural changes that have occurred in the manufacturing sector in Maharashtra.

V
Manufacturing Sector

To understand the pattern of growth in the manufacturing sector of Maharashtra, annual compound growth rates have been estimated for the period 1979-80 to 1994-95. Fixed capital of the manufacturing sector has grown by 9.65 per cent per annum over the period, non-agriculture related industries increasing by 10.65 per cent per annum, and agriculture-related industries increasing by only 6.98 per cent (Table 6).

Annual compound growth rates for two-digit industries in manufacturing sector are also estimated. Manufacture of non-metallic mineral products (32) shows the highest growth of 16.63 per cent per annum in fixed capital in the manufacturing sector. Manufacture of rubber, plastic, petroleum and coal products (30), leather and leather products (29), basic metal and alloys industries (33) and others show growth rates in fixed capital of more than 10 per cent per annum.

The output of the manufacturing sector increased by 7.12 per cent per annum. The non-agriculture related industries show higher growth rate in output at 7.93 per cent compared to the agriculture related industries which recorded 5.07 per cent growth rate per annum. Among the two-digit industries, other manufacturing industries (38) show the highest growth rate in output of 16.99 per cent per annum. It may be because this industry includes fast growing modern hi-technology industries like computer and information technology. The output of manufacture of rubber, plastic, petroleum and coal products (30), textile products (26) and other manufacturing industries (38) show high growth rate in output. The manufacture of wood and wood products (27) is the only industry which experienced decrease in output at the rate of 2.32 per cent per annum.

The manufacturing sector experienced a growth rate of 6 per cent per annum in net value added during the period of 1979-80 to 1994-95 in the state. Non-agriculture related industries show higher growth rate of 6.63 per cent in net value added compared to that of 4.19 per cent of agriculture-related industries. In case of net value added within two-digit industries, the manufacture of cotton textiles (23), recorded negative growth rate for the period under study. However, manufacture of leather and leather products (29) and textile products (26) recorded 12.60 and 13.46 per cent growth rates in value added respectively.

The performance of the state in terms of employment in the manufacturing sector is very unsatisfactory. The employment in the manufacturing sector over the period declined by 0.28 per cent per annum. This is mainly because employment in agriculture-related industries declined by 1.38 per cent per annum. However, in non-

1992-93	13.49	8.98	13.73	12.30
1993-94	12.62	8.81	14.18	12.03
1994-95	12.77	8.66	11.73	11.55

agriculture related industries employment increased by 0.65 per cent per annum. Among the two-digit industries, repair of capital goods (39) realised 6.66 per cent per annum growth in employment. However, the industry is new and its data pertains to only the last six years (1989-90 to 1994-95). Industries such as food products (20-21), cotton textiles (23), wool, silk and synthetic fibre (24), wood and wood products (27), paper and paper products (28), basic metal and alloys industries (33), and transport equipments (37) recorded decrease in employment during the period. Overall, the employment in the manufacturing sector of the state declined over the period 1979-80 to 1994-95.

Although employment in the state is falling, the total emoluments at constant prices for the manufacturing sector has increased by 3 per cent per annum. The increase in emoluments is higher, i e, 3.71 per cent per annum in non-agriculture related industries, while in agriculture-related industries the increase is merely 1.51 per cent. Industries such as cotton textiles (23) and wood and wood products (27) realised a fall in emoluments. Overall, there is an increase in fixed capital and fall in employment, at the same time recording a rise in output and value added over the period of 1979-80 to 1994-95.

VI
Elasticity

We now turn to estimates of the employment and output elasticities for the manufacturing sector.

Employment elasticity: As seen in the last section, fixed capital is increasing while employment is declining in the state during this period. To study these opposite trends, employment elasticities have been estimated for industries in manufacturing sector. Using the equation (2)

$$\ln Lt = a0 + a1 \ln Yt - a2 \ln Kt \quad \ldots(2)$$

the employment elasticity with respect to output and fixed capital has been estimated. The employment elasticity with respect to output for the entire manufacturing sector is (–) 0.13 (Table 7). The elasticity for agriculture-related industries is negative 0.32. This implies that an increase in output decreases employment. The non-agriculture related industries show the employment elasticity of 0.05. The manufacture of textiles (23), textile products(26), wood and wood products (27), leather and leather products (29), non-metallic mineral products (32), etc, show positive employment elasticity with respect to output.

Employment elasticity with respect to fixed capital for the manufacturing sector in the state is 0.08. This implies that fixed capital is complementary to labour. Fixed capital is used more as a substitute for labour employment in non-agriculture related industries which explains the greater fall in employment in this group. In agriculture-related industries like manufacture of beverages, tobacco and tobacco products (22), wool, silk and synthetic fibre (24), etc, we evidence positive employment elasticity with respect to fixed capital. Thus, in these industries the use of fixed capital is complementary to employment of labour in the state. Overall at the state level, in the manufacturing sector as a whole, fixed capital use seems to be complementary to labour employment.

Output elasticity: Efforts are also made to measure the output elasticity with respect to fixed capital and labour using equation (3).

$$\ln (Y/L)t = a0 + a1 \ln (K/L)t \quad \ldots(3)$$

Output elasticity with respect to fixed capital for the manufacturing sector as a whole is 0.75 (Table 7), 0.75 for agriculture-related industries and 0.73 non-agriculture related industries. In case of two-digit industries the manufacture of food products (20-21), cotton textiles (23)

NAGRIND	0.05	(–)0.05	0.73	0.27

Notes: $\ln Lt = a0 + a1 \ln Yt - a2 \ln Kt$ ...(2)
$a2 > 0$ = K is complementary.
$a2 < 0$ = K is substitute.
$\ln (Y/L)t = a0 + a1 \ln (K/L)t$ ...(3)

textile products (26), chemical and chemical products (31), transport equipment (37), etc, the output elasticity with respect to fixed capital is more than 0.50. Output elasticity with respect to labour for the manufacturing sector is 0.25, which is lower than that of fixed capital. This implies that output responds more to fixed capital than to labour. Agriculture-related industries show output elasticity with respect to labour of 0.25 which is lower than that of 0.27 for non-agriculture related industries. Output elasticity with respect to labour is negative for manufacture of transport equipment (37) and other manufacturing industries (38). It means that the output responds to labour inversely in these industries suggesting large increases in labour productivity of these industries. For the rest of industries in the manufacturing sector the output elasticity with respect to labour varies between 0.10 and 0.91.

VII
Factor Intensity

Factor intensity may be studied using fixed capital per employee and value added per employee.

Fixed capital per employee

To gain insights into the trends in the factor proportions in the manufacturing sector, industries can be grouped into capital-intensive and labour-intensive industries according to whether capital per employee (K/L) is above or below the average for all the industries. However, it must be pointed out that the concepts of capital-intensive and labour-intensive industries are used only in a relative sense and not in absolute terms. Further, using the average capital labour ratio as the cut-off point for classifying industries into capital-intensive and labour-intensive ones may, however, be arbitrary. Moreover, in the absence of a specific capital-labour ratio for all the industries, average capital-labour ratio is used as the criterion for this purpose.

The average capital per employee for all the manufacturing sector was Rs 0.23 lakh in 1979-80 and Rs 0.96 lakh in 1994-95, both at 1981-82 prices. The industries with capital per employee above these respective averages may be regarded as capital-intensive and those with capital per employee below them as labour-intensive. The industries coming under each of these categories in 1979-80 and 1994-95 are listed here.

(i) *Capital-intensive industries*:
 1979-80: Industries (nos) – 20-21, 30, 31, 33, 37.
 1994-95: Industries (nos) – 24, 30, 31, 33, 37.

(ii) *Labour-intensive Industries*:
 1979-80: Industries (nos) – 22, 23, 24, 25, 26, 27, 28, 29, 32, 34, 35-36, 38.
 1994-95: Industries (nos) – 20-21, 22, 23, 25, 26, 27, 28, 29, 32, 34, 35-36, 38, 39.

It may be observed from the list that the structure of industries by factor intensity in 1994-95 remained largely the same as in 1979-80. There were, however, a few significant exceptions. The manufacture of food products (20-21), which was in the capital-intensive category in 1979-80 shifted to the labour-intensive category in 1994-95. In contrast, manufacture of wool, silk and synthetic fibre (24), which was in the labour-intensive category in 1979-80, shifted to the capital-intensive category in 1994-95.

The dwindling share of capital-intensive industries in the manufacturing sector is clearly indicated. Capital intensive-industries accounted for as much as 62.57 per cent of the total fixed capital in 1979-80 and contributed 49.10 per cent to value added and 60.72 per cent to output by employing 37.51 per cent of total number of employees in the manufacturing sector. By 1994-95 their share in employment decreased to 33.08 per cent, share in fixed capital decreased to 60.25 per cent and in value of output declined to 56.51 per cent. But their share in value added increased to 52.26 per cent. The share of the labour-intensive industries changed correspondingly. Thus, labour-intensive industries provided employment to as much as 66.92 per cent of the total employment in manufacturing sector by employing only 39.75 per cent of its capital assets in 1994-95. By the same token, it may be observed that, the capital-intensive industries usurped a large chunk of fixed capital, i e, 60.25 per cent, but absorbed just 33.08 per cent of the total employees of the manufacturing sector in the state in 1994-95.

Value added per employee

The factor intensity in the manufacturing sector can be estimated by using Lary's index. This method involves using the value added per employee comprising wage and non-wage components as a composite index for the amount of human and physical capital embodied in the production of a good. The wage and non-wage components of the value added per employee may be taken to reflect the flows of the services of labour (human capital) and capital (physical capital) into the manufacturing process. Thus, the wage component of the value added per employee can be used as a proxy for human capital and the non-wage component, a proxy for physical capital.

Lary's method is based on two assumptions. First, the inter-industry differences in wages are assumed to reflect differences in their requirements of skilled labour. Since wage rates are positively related to the skill levels, this assumption is not restrictive. As Lary has demonstrated, US data reveal a positive and significant correlation between the wage value added per employee and the ratio of skilled labour to the total employment. This phenomenon was examined by Mitra (1974) in the light of the Indian data for the period 1960-65 and his results supported it. Second, inter-industry differences in the non-wage value added per employee are assumed to reflect differences in respect of physical capital invested. Accordingly, the non-wage value added per employee can be used as the indicator of the physical capital as against the stock figures.

Though affected by various market imperfections, there are two advantages of value added per employee as a criterion of capital intensity. One is that, being a flow rather than a stock figure, it fits in better with the notion of factor inputs into production and therefore it is more relevant to the theory of production functions. Secondly, it bypasses the difficulty of measuring the stock of physical capital.

Thus, value added per employee can be used as a reasonably good guide to the factor intensity of different industries. Industries can be classified into labour-intensive or capital-intensive ones according to whether the value added per employee is lower than or higher than the average value added for all the industries. Therefore, it can be postulated that the higher the value added per employee, the more capital-intensive the industry; lower the value added per employee, the more labour-intensive the industry. The average value added per employee for all the industries was Rs 0.26 lakh in 1979-80 and Rs 0.63 lakh in 1994-95 both at 1981-82 prices. The industries with value added per employee below these respective averages are regarded as labour-intensive and those with value added per employee above them as capital-intensive. The industries coming under each of these categories in 1979-80 and 1994-95 are listed here.

(i) *Capital-intensive industries*:
 1979-80: Industries (nos) – 30, 31, 33, 34, 35-36, 37.
 1994-95: Industries (nos) – 24, 30, 31, 33, 35-36, 37.

(ii) *Labour-intensive industries*:
 1979-80: Industries (nos) – 20-21, 22, 23, 24, 25, 26, 27, 28, 29, 32, 38.

1994-95: Industries (nos) – 20-21, 22, 23, 25, 26, 27, 28, 29, 32, 34, 38, 39.

It may be observed that the structure of industries by factor intensity in 1994-95 remained largely the same as in 1979-80. There were, however, a few significant exceptions.

The dwindling share of labour-intensive industries in the manufacturing sector is clearly indicated. Capital intensive industries accounted for as much as 67.52 per cent of the total fixed capital in 1979-80 and contributed 66.11 per cent of value added and 64.02 per cent of output by employing 44.98 per cent of the total number of employees in the manufacturing sector in the state. By 1994-95 their share in employment increased to 47.84 per cent and in fixed capital to 72.09 per cent, while their share in value of output increased to 70.24 per cent. The share of these industries in value added jumped to 69.89 per cent in 1994-95. The share of labour-intensive industries declined correspondingly. In short, the capital-intensive industries are becoming more dominant in the state.

VIII
Structural Ratios

In order to analyse industrial production in Maharashtra, it is worthwhile to examine some key ratios. Instead of just analysing the ratios, it is more appropriate to analyse the changes in these ratios which will reflect the structural changes in the industry in the state. This has been done by formulating some specific questions to which these ratios would provide the answers. They are as follows: (i) what is the increase in the cost of creating one job, i e, growth of (FC/NE)? (ii) what is the level of growth in the productivity of an employee and in per unit of fixed capital, i e, growth of (VA/NE) and (VA/FC)? (iii) what is the increase in the average wage of an employee, i e, growth of (EMO/NE)? (iv) what is the change in the share of wages in value added i e, growth of (EMO/VA)? (v) what is the increase in fixed capital per unit of output, i e, growth of (FC/VO)? (vi) what is the increase in average output of an employee, i e, growth of (VO/NE)? (vii) what is the increase in labour cost per unit of output, i e, growth of (EMO/VO)? and (viii) what is the change in value added generated by one unit of output, i e, growth of (VA/VO)? The answers to all these questions vary according to the industry in the manufacturing sector of the state. The annual compound growth rate has been computed for these ratios for the period from 1979-80 to 1994-95.

The cost of creating one job means the fixed capital per employee. This is the indicator of capital intensity of the industry. The cost of creating one job increased by 9.96 per cent per annum in the manufacturing sector (Table 8). The non-agriculture related industries show higher increase than the agriculture-related industries. However, manufacture of non-metallic mineral products (32) shows the highest increase of 16.39 per cent per annum for the period. The repair of capital goods (39) shows a decrease in this cost.

Increase in productivity of an employee is 6.29 per cent for the manufacturing sector. The non-agriculture related industries demonstrate higher labour productivity than that of the agriculture-related industries. The rise in labour productivity is highest in the manufacture of textile products (26). However, the manufacture of cotton textiles (23) demonstrates a fall in labour productivity in the state during the period. In case of capital productivity (VA/FC), the state experienced a fall of 3.33 per cent per annum during the period. The fall in capital productivity is more pronounced in non-agriculture related industries. The industries in the manufacturing sector except manufacture of food products (20-21), textile products (26), other industries (38) and repair of capital goods (39), demonstrate a fall in capital productivity. This fall is more pronounced in the case of manufacture of cotton textiles (23). The fall in capital productivity

Notes. FC= Fixed Capital; NE = Number of employees; EMO = Total emoluments to employees; VA = Value added; VO = Value of output.
* Statistically insignificant at 5 per cent level. # Data for industry 39 is available from 1989–90 onwards.

may be because of rising capital intensity in the manufacturing sector of the state.

The average wage of an employee (EMO/NE) in the manufacturing sector increased by 3.29 per cent per annum during the period. However, the increase in labour productivity is much more than the rise in average wage of the employee. The non-agriculture-related industries experienced higher rise in average wage than the agriculture-related industries in the state. All the industries in the manufacturing sector experienced growth in the average wage of employees.

Though the average wage of an employee in the manufacturing sector showed an increase, the share of emoluments to employees in value added (EMO/VA) declined for the manufacturing sector during the period in the state. That is, the wage share in value added declined by 2.83 per cent per annum. This implies that the non-wage share has increased in the manufacturing sector. The share of emoluments in value added declined faster in non-agriculture related industries than in agriculture-related industries. This share declined in all the industries except manufacture of cotton textiles (23). The decline is more pronounced in manufacture of textile products (26). The manufacture of cotton textiles (23) experienced rise in the share of emoluments in value added by 7.99 per cent per annum during the period.

The increase in capital-output ratio (FC/VO) is 2.36 per cent per annum. This means that every unit of output is produced with more and more fixed capital. This rise is much faster for non-agriculture related industries than for agriculture related industries. The increase in capital-output ratio is substantial in the manufacture of non-metallic mineral products (32), metal products and parts (34) and beverages, tobacco and tobacco products (22). However, some of the industries experienced a fall in capital-output ratio during the period. This fall is substantial in other manufacturing industries (38).

The increase in average output of an employee (VO/NE) is 7.42 per cent per annum in the manufacturing sector in the state. This increase is higher in non-agriculture related industries than in agriculture-related industries. The increase in output per employee is 13.72 per cent in other manufacturing industries (38). This general rise may be because of falling employment and rising labour productivity in the manufacturing sector in the state. The rising output per employee resulted in a fall in labour cost per unit of output (EMO/VO). The emoluments per unit of output has been falling by 3.85 per cent per annum during the period. Labour cost per unit of output declined in the state by 3.85 per cent per annum, falling faster in non-agriculture related industries than in agriculture-related industries. Emoluments per unit of output has been declining in all industries except wood and wood products (27).

The value added generated by every unit of output (VA/VO) in manufacturing sector in the state is declining. The value added per unit of output is falling faster in non-agriculture related industries as compared to agriculture-related industries. The value added per unit of output has been increasing in agriculture-related industries except manufacture of cotton textiles (23) and manufacture of wool, silk and synthetic fibre (24), whereas except a few industries, it has been declining in all the industries of non-agriculture related industries group. The fall in value added per unit of output may be associated with a fall in emoluments per unit of output. Moreover the wage share in value added is declining with falling employment and only non-wage share is increasing with increasing capital intensity.

All these structural ratios explain the increasing capital intensity, falling employment, and consequently rising labour productivity and falling labour cost in the manufacturing sector in Maharashtra. Rising wages with falling employment explains the increasing skill composition of the employees which results in an increase in labour productivity. The increasing capital intensity and higher skills explain the rising output per employee.

IX
Responsible Factors

Maharashtra was at one time the dominant state in respect of industrial development. The above analysis clearly shows that the state is experiencing a slow-down in industrial growth and that the structural changes are showing increasing capital intensity in production. Though the main purpose of this study is not of discerning the reasons for this state of affairs, to make the study complete, it is necessary to mention a few major factors.

Industrial disputes: The state experienced a major set back from the textile mill workers strike in Mumbai. This strike adversely affected both industrial workers and industries. Increasing trade unionisation in the state made industries substitute capital for labour. This has been reflected in the rising capital intensity in the manufacturing sector in the state. The militancy among trade unions also disturbed the industrial peace in the major industrial centres of the state. Table 9 explains the number of workers involved and number of mandays lost due to strikes and lockouts. In terms of wages and productivity Maharashtra's labour looks costlier than the labour in other states.

TABLE 11: COMPETITIVENESS RANKING OF INDIAN STATES

Infrastructure: In the 1960s and 1970s Maharashtra had a better position in relation to infrastructure. However, in the 1980s the state lost its vantage position in this regard. Infrastructurewise other states are doing much better than Maharashtra. Infrastructural development did not occur sufficiently in places other than Mumbai, Thane, Pune, Nashik, Aurangabad belt. The growth of infrastructure in the state is certainly not satisfactory compared to other states. In this respect Gujarat and Tamil Nadu did much better than Maharashtra (Table 10).

State's industrial location policy: In Maharashtra the industrial concentration has always been in the Mumbai-Thane Pune belt. In order to have a balanced industrial development, and for dispersal of industries to backward regions, the state stopped issuing licences to new industrial units in this region. Similarly, capacity expansion was also curbed. For industrial dispersal the state provided some incentives for setting up industries in backward regions. However, considering the availability of infrastructure in the backward regions of the state, industries preferred to go to the neighboring states which were providing some more incentives and better infrastructural facilities. The state lost many industries due to this reason. A large number of small-scale units shifted to Gujarat, Karnataka and Tamil Nadu also.

Competition among states: During the 1980s many states realised their industrial backwardness and others understood their mistakes in earlier state industrial policies. These states started giving more and more fiscal incentives, better infrastructural facilities, less bureaucratic administration, etc, while Maharashtra went on following exactly the opposite policy. On this front Maharashtra is the main loser in case of manufacture of chemical and chemical products. States like Gujarat, Tamil Nadu, West Bengal, Karnataka, Andhra Pradesh, etc, are competing with Maharashtra. These states are giving more and more fiscal incentives, have less bureaucratic administration, better infrastructure facilities and are also trying to provide better climate of industrial relations.

State competitiveness: Competitiveness of a state can be broadly considered as the overall health of the economy in terms of various observable economic and social indicators which adequately demonstrate the level of development attained by the states. In a market economy, the relative competitiveness of the states becomes the guiding factor for the private corporate sector while evolving their future investment strategies. Therefore, it is necessary to analyse the relative competitiveness of Maharashtra on various performance indicators.

National Productivity Council (1994) constructed State Competitiveness Index (SCI) for major states of India. Competitiveness of the state is a composite index which includes the following 11 variables, viz, (1) transport infrastructure (road, rail and waterways), (2) telephone availability, (3) installed electricity generation capacity, (4) distribution of commercial banks, (5) life expectancy, (6) literacy rate, (7) population below poverty line, (8) size of the market (consumption + savings),(9) labour climate (mandays lost), (10) political stability, and (11) taxes levied by state government. Among these 11 variables 7th, 9th, 10th and 11th are negatively associated with the overall competitiveness of the state, while the remaining seven are positively associated. The competitiveness ranking of select 15 states of India arrived at by National Productivity Council leads to the conclusion that Maharashtra lagged behind many other states (Table 11). Punjab, Kerala, Haryana, Gujarat, Karnataka and Tamil Nadu are competitively better states than Maharashtra. These states are in a better position to attract private corporate sector than Maharashtra. Maharashtra's performance is relatively poor in case of (1) transport infrastructure (road, rail and waterways), (2) telephone availability, (4) distribution of commercial banks, (7) population below poverty line, (9) labour climate (mandays lost), and (11) taxes levied by state government.

The deteriorating law and order situation and rising extortionary activities in Mumbai, bureaucratisation of state administration, political indecisiveness, backwardness of rural Maharashtra, high power tariff, and rising systemic inefficiencies are some more causes directly or indirectly affecting industrial development. The foregoing analysis is only an initial attempt at identifying factors affecting industrial growth in the state. A more systematic and detailed analysis will be required to examine the effects of these factors.

X
Impact of Liberalisation

Using a 'Kinked Exponential Model' [Boyce 1986], the growth rate has been estimated for pre-liberalisation and post-liberalisation periods for the manufacturing sector of Maharashtra. The period 1980-81 to 1994-95 has been divided into two sub-periods, i e, 1980-81 to 1991-92 is pre-liberalisation and 1991-92 to 1994-95 is post-liberalisation. It is widely known that the inception of the economic reforms signalled the liberalisation of the Indian industry from the earlier licence raj as also from many other restrictions. The successive reductions in taxes and import

Data for industry 39 is available from 1989–90 onwards.

liberalisation with export promotion also boosted Indian industry. The devaluation of the rupee gave an impetus to foreign trade and industry. The capital market reforms and liberalised rules with regard to foreign capital entry ensured better access of industry to finance. The liberalisation programme facilitated private investment through dismantling of government controls on capacity creation, production and pricing, improved access to imported capital equipment, raw materials and intermediates and easier possibilities of technical and financial collaboration with foreign entrepreneurs. Liberalisation combined with devaluation has resulted in an increase in manufacturing production directed towards export markets. Liberalisation provided a 'once-and-for- all' stimulus to manufacturing growth in India through meeting the pent-up demand and opening of the infrastructure market to the private sector [Chandrasekhar 1996]. All this has helped the manufacturing sector in India in general and Maharashtra in particular. The growth performance is bound to vary across the industry depending on the nature of the industry in the state. To assess the performance of the manufacturing sector in the state, growth rates of output, fixed capital and value added all at the constant prices of 1981-82 and employment are estimated for the above mentioned period and sub-periods.

The growth rate of output of the manufacturing sector during the post-liberalisation period accelerated (Table 12), and it is more pronounced for beverages, tobacco and tobacco products (22), wool, silk and synthetic fibre textiles (24), textile products (26), paper and paper products, basic metal and alloys industries (33), metal products and parts (34), manufacture of machinery and machine tools (35-36), transport equipment and parts (37) and other manufacturing industries (38). However, cotton textiles (23), wood and wood products (27) and non-metallic mineral products (32) recorded a decrease in output in the post-liberalisation period. The food products (20-21), leather and leather products (29) and chemical and chemical products (31) show deceleration in the output during the post-liberalisation period.

The growth of employment in the manufacturing sector of the state recovered during the post-liberalisation period. The recovery is very pronounced in agriculture-related industries in the state. The food products (20-21), wood and wood products (27), paper and paper products (28), metal and alloys industries (33), metal products and parts (34), and manufacture of machinery and machine tools (35-36) all realised very pronounced recovery in employment during the post-liberalisation period in the state. However, leather and leather products (29) and non-metallic mineral products experienced a decrease in employment during post-liberalisation, while cotton textiles (23), wool, silk and synthetic fibre textiles (24) and transport equipment and parts (37) could not reverse the pre-liberalisation trend in employment during the post-liberalisation period (Table 13).

In case of fixed capital in the manufacturing sector the performance of the state is certainly better and this is more pronounced in agriculture-related industries during the post-liberalisation period (Table 14). The metal products and parts (34), textile products (26) and other manufacturing industries (38) recorded growth of fixed capital of more than 30 per cent during the post-liberalisation period. However, industries such as leather and leather products (29) and non-metallic mineral products (32) experienced a decrease in fixed capital during the post-liberalisation period.

The manufacturing sector of the state experienced substantial increases in net value added during the post-liberalisation period and it is very pronounced in agriculture-related industries (Table 15). The textile products (26), wool, silk and synthetic fibre textiles (24), paper and paper products (28), chemical and chemical products (31), other manufacturing industries (38), basic metal and alloys industries (33) and wood and wood products (27) recorded a rise in value added by more than 20 per cent per annum during the post-liberalisation period. However, cotton textile (23), leather and leather products (29) and non-metallic mineral products (32) experienced a substantial fall in net value added during post-liberalisation period.

In short, the manufacturing sector of the state certainly revived in terms of growth of output, employment, fixed capital and value added during the post-liberalisation period. This revival is more pronounced in agriculture-related industries in the manufacturing sector. However, this general tendency has some exceptions, overall performance of cotton textiles (23), non-metallic mineral products (32) and leather and leather products (29) deteriorated further during the post-liberalisation period.

XI
Conclusions

Maharashtra is the major contributor to the industrial sector in India. Over 1969-70 to 1994-95, however, the share of the state in the country's industrial sector has declined. The share of th secondary sector in state domestic product is stagnating at around 33 to 34 pe cent, while the share of the tertiary secto

increasing. The composition of industries in the state is undergoing major changes. The share of consumer goods in value added declined to less than 20 per cent while the share of capital and intermediate goods industries increased to more than 80 per cent over the period of 36 years. During the 1990s the concentration of fixed capital, value added and value of output increased in the manufacturing sector. The state realised higher growth in fixed capital at the cost of employment. Non-agriculture related industries experienced better growth than the agriculture-related industries. The complementary role of capital declined in many industries and more industries have begun substituting capital for labour. As a result capital intensity in the manufacturing sector is increasing at a faster rate.

In Maharashtra the cost of creating jobs in the manufacturing sector has increased, and this increase is more pronounced in non-agriculture related industries. The rising capital and falling employment leads to increase in labour productivity and fall in capital productivity. Employment is falling but average real wages are increasing indicating the rise in the skill composition of labour. The increase in real wages is, of course, lower than the productivity of labour. As a result the labour cost per unit of output is falling in the state.

The manufacture of jute, hemp and mesta (25), and cotton textiles (23) are declining industries, while leather and leather products (29), textile products (26) and computer and information technology industry are expanding industries in the manufacturing sector of the state.

Rising capital intensity and falling employment, and substitution of capital for labour, low growth rate of value of output and value added all reflect the unsatisfactory performance of the state in industrial activity. This state of affairs may be due to insufficient infrastructure, high power tariff, industrial disputes, state policies, aggressive competition from other states, and increasing bureaucratisation of the state administration. The declining law and order situation and rising extortionary activities in Mumbai, political indecisiveness are also some of the other factors responsible for this state of affairs. However, the industrial recovery is clearly seen by the state during the post-liberalisation period. Industries such as textile products (26), metal products and parts (34), machinery and machine tools (35-36) and other manufacturing industries (38), etc, show a positive impact of economic reforms on their performance in the post-liberalisation period. Nonetheless, the performance of cotton textiles (23), non-metallic mineral products (32) and leather and leather products (29) deteriorated further during the post-liberalisation period.

However, the state of Maharashtra still has a comparative advantage in industrial activity. In order to accelerate industrial development in the state it has to be supplemented by competitive advantage which can be engendered, nurtured and shaped by appropriate policy initiatives by the government.

[The author wishes to thank Dilip Nachane, P Venkatramaiah and M J M Rao for helpful discussions and incisive comments on an earlier draft. He also wishes to thank Romar Correa, Neeraj Hatekar, Ritu Dewan, Mala Lalvani and A Balachandran for suggestions and advice. Annexure I

Two Digit Industrial Classification

Industry Code	Description of Industry
20-21	Manufacture of food products
22	Manufacture of beverages, tobacco and tobacco products.
23	Manufacture of cotton textiles.
24	Manufacture of wool, silk and synthetic fibre textiles.
25	Manufacture of jute, hemp and mesta textiles (except cotton).
26	Manufacture of textile products (including wearing apparel).
27	Manufacture of wood and wood products: furniture and fixtures.
28	Manufacture of paper and paper products and printing, publishing and allied industries.
29	Manufacture of leather and leather products, fur and substitutes of leather.
30	Manufacture of rubber, plastic, petroleum and coal products.
31	Manufacture of chemical and chemical products (except products of petroleum and coal).
32	Manufacture of non-metallic mineral products.
33	Basic metal and alloys industries.
34	Manufacture of metal products and parts except machinery and transport equipment.
35-36	Manufacture of machinery (electrical and non-electrical) machine tools, apparatus, appliances and parts.
37	Manufacture of transport equipment and parts.
38	Other manufacturing industries.
39	Repair of capital goods.
2-3	Manufacturing.

Linguistic Perspectives on Subcontinental English

Tista Bagchi

South Asian English: Structure, Use, and Users edited by Robert J Baumgardner; Oxford University Press, Delhi, 1996; pp xviii + 286, Rs 495.

THE reality of a south Asian variety (or perhaps cluster of varieties) of English is increasingly being acknowledged in the worlds of educational policy and research, lexicography, and of course the media in the subcontinent. This recognition of south Asian English as a regional variant in its own right, of course, brings with it attendant questions, doubts, and problems, in the south Asian political and socio-economic context as well as in the context of globalisation; but, especially because of this, it is an issue worth the attention of all those who have to negotiate the teaching, maintenance, and promotion of English in south Asia. *South Asian English: Structure, Use, and Users* is a step in this direction.

The essays in this anthology grew out of a conference on south Asian English organised in Islamabad, Pakistan, in 1989, and represent a small selection of the papers originally presented at this conference. One cannot help wondering whether there is some connection between the decision to publish an anthology of this kind on south Asian English and the fact that the intervening years have seen the placing of Indo-Anglian literature on the global market for fiction (and, occasionally, considerable public hype over their fetching mega-bucks in the form of publishers' advances and winning prestigious literary awards recognised in the west). The fact that Indo-Anglian fiction has been increasingly appearing in televised and cinematographic form has certainly been bringing it growing public attention in urban India.

While the elitist role of English in the south Asian situation is a well-examined fact, what one cannot help noting is the substantial evidence presented in the more empirical essays that English in south Asia is in fact threatening to break out of its elite bounds and thus claim a (possibly competing) space for itself alongside western English. Also to be noted is the title *South Asian English* given to the anthology – note that the authors' concern is not just Pakistani English, but Indian, Bangladeshi, Sri Lankan, and Nepali English as well. What is common to English in all the south Asian nations is its status as a language to be learned for pragmatic goals geared towards upward socio-economic mobility. People typically learn – or pick up – languages with functional, practical goals in view; the desire for upward mobility or 'exclusiveness' merely comes along for the ride in a hierarchically organised society where the greater part of the material resources are available to only a small fraction of the population. Most Indians, even the poorest of the poor, have some kind of spoken competence in at least two linguistic codes (i e, what one would call 'languages' and or 'dialects'), and sometimes – for reasons of livelihood if nothing else – in three or more. This may not seem such a striking fact in isolation, but proves to be so especially when compared to the exclusively or predominantly monolingual situations found in many regions of the world, including in many western countries. English in south Asia must be viewed keeping in mind this south Asian sociolinguistic reality of bi- or multi-lingualism.

However, *literacy* in these languages of ours, let alone in English, is another matter altogether. Even today, the literacy rates for the different states of India vary widely; and, while the matter of instruction in English at the primary level of education is a contentious political issue in several parts of the country (as is evident from the numerous articles on the subject that have appeared in the pages of the *EPW* over the years), what is often overlooked is the scarcity of proper resources (and, especially, human resources) for the teaching of languages in schools – whether these are the local and/or regional languages or English or some other foreign language such as Portuguese or French (in the erstwhile settlements of speakers of these languages). This is not an issue that has been addressed in the anthology under review, given its focus on educated urban users of English in south Asia. To be fair to the contributors, however, given the urban, upper-income bias, they have attempted to be as comprehensive and as impartial as possible in covering the widest possible cross-section of educated urban users of English in the various countries of south Asia.

The 16 essays in the anthology have been grouped into five sections ('Contexts and Issues', 'Structure and Contact', 'Functions and Innovations', 'The Curriculum', 'English and the Multilingual's Creativity'). What is of interest here is that a number of the contributors are also theoretical linguists who have been engaged in the structural analysis of languages for years, if not decades. Notable among these are Charles A Ferguson (who has pursued research on the structural features of Arabic and of Bengali broadly along pre-Chomskyan, descriptivist lines; his contribution in this volume is entitled 'English in South Asia: Imperialist Legacy and Regional Asset'), S N Sridhar (who has, among other things, done extensive work on various aspects of word and sentence structure in Kannada in the generative, i e, broadly Chomskyan, tradition; author in this volume of 'Towards a Syntax of South Asian English: Defining the Lectal Range'), and Yamuna Kachru (distinguished for her work on the structure of Hindi-Urdu, also in the generative tradition; contributor of 'Language and Cultural Meaning: Expository Writing in South Asian English'). Consequently, their examination of various aspects of south Asian English is informed by a knowledge of specific features of some of the living languages that form the 'substratum' of south Asian English. Yamuna Kachru's observation that English in south Asia is to be viewed against the backdrop of south Asia as an established linguistic area is also noteworthy. Others, like Braj B Kachru ('South Asian English: Towards an Identity in Diaspora'), Richard W Bailey ('Attitudes towards English: The Future of English in South Asia'), Beverly S Hartford ('The Relationship of New Englishes and Linguistic Theory: A Cognitive-Based Grammar of Nepali English'), Kamal K Sridhar ('The Pragmatics of South Asian English'), and the editor himself (who also has an article, 'Innovation in the Pakistani English Political Lexis'), have been engaged in the sociolinguistic and structural examination of varieties of non-western English in different parts of the world. Articles that are particularly informative for an Indian or Pakistani readership are those focusing on the use of English in Bangladesh, Nepal and Sri Lanka, viz, 'Acceptability and English Curriculum

Change in Bangladesh' by A M M Hamidur Rahman, 'Some Features of Nepali Newspaper English' by Yugeshwar P Verma, Beverly S Hartford's article, 'Syntactic 'Deletion' in Lankan English: Learning from a New Variety of English about – [sic]' by Thiru Kandiah, and 'The Ideational Function of English in Sri Lanka' by Chitra Fernando. S V Shastri's report, in his article 'Using Computer Corpora in the Description of Language with Special Reference to Complementation in Indian English', that the syntactic differences between Indian English and western English are not as significant as is widely believed, is especially intriguing, and provides a starting point for further such corpus-based studies.

Amidst these articles, V K Bhatia's contribution 'Nativization of Job Applications in South Asia' stands out in highlighting what might for some readers be rather an embarrassing fact, namely, that the linguistic devices that work to a reasonable degree within the cultural context in which a south Asian language is situated appear overly supplicatory or naive when used in applications in English for jobs or scholarships directed towards western institutions. The altered geopolitical relationships in which south Asia has come to participate since the time of British colonial rule, with an accompanying lack of change in the stylistic devices used in formal or official correspondence in English within the south Asian area, are possibly responsible for this. Added to this, however, is the elitist push towards the glorification of the developed countries of the west as utopia (despite the fact that, among other things, middle- and upper-middle-class south Asians with the same absolute income levels as their counterparts in the so-called 'rich' western countries enjoy a better quality of life than the latter in most respects), which percolates down to lower-income levels as well.

Now for a couple of limitations that the anthology suffers from. There is an overwhelming concern evident throughout the anthology that no polemical issues or attitudes should be focused upon unduly. While one appreciates the ideals of objectivity and unbiased opinion that the editor and the contributors have obviously striven to adhere to, especially given the contentiousness of the subject, the result is that one has a rather staid collection; the only occasionally colourful observations and insights are offered by Anita Desai (in her rather aptly entitled contribution 'A Coat of Many Colours') and Bapsi Sidhwa (whose analysis of her *Ice-Candy Man* in her article 'Creative Processes in Pakistani English Fiction' may well afford to a lay audience in this country just about the only glimpse of what Deepa Mehta has sought to bring alive visually in her film *Earth*), the two creative writers represented among the contributors. There is also a lack of representation of the copious work of people engaging with the literary status and pedagogical history of English in India and with Indo-Anglian literature, which somewhat detracts from the value of the anthology to a wider audience interested in the more literary, cultural and political issues surrounding English in south Asia. For all its limitations, however, this is a useful anthology that can serve as a reference for factual evidence regarding structural and discourse features of south Asian English as collated and interpreted by professional theoretical and applied linguists engaging with the issue.

Restating the Case for Development

Mohan Rao

Health and Development: Intersectoral Linkages in India by K V Narayana; Rawat Publications, Jaipur, pp 197, Rs 220 (hardcover).

WHAT is the nature of the relationship between health and socio-economic development? Are historical lessons valid when it is claimed that history is at an end? What are the insights the history of health offers for health policy in developing countries today? Are favourable health outcomes related to economic growth alone or to egalitarianism? These are some of the questions that propelled the investigations in this brief book.

Most physicians and health policy planners would attribute the spectacular increase in human longevity achieved in the west since the 18th century to advances in medical technology. However, Thomas McKeown surveying the decline of the death rate in England and Wales in the registration period observed that significant and long-term declines in the death rate had occurred due to a decline in infectious and communicable diseases, the quintessential diseases of poverty and hunger. This decline in infectious diseases was unlikely to be related to changes in the virulence of the infectious agents over so short a period of time. Nor could it be attributed to salubrious changes in the environment, which indeed had deteriorated due to industrialisation and urbanisation. Excluding these possible causes for the decline of infectious diseases, McKeown went on to conclude that the dramatic decline could only have been a consequence of increased general resistance to infectious diseases through improvement in the nutritional status of the population as a result of wide-ranging changes in the agrarian economy. While McKeown acknowledged that the public health revolution of the late 19th century played an important role in reducing exposure to water-borne diseases such as diarrhoea and cholera, these could account for, at the most, a quarter to a third of the mortality decline. Even in the case of this group of diseases, the underlying cause for the decline of lethality may well have been the same, viz, increasing human resistance due to improvements in nutrition.

McKeown's thesis has been substantially strengthened by a number of other studies in other countries in the west which had similar trajectories in health as living standards improved. Indeed the period also witnessed a secular increase in heights, accompanied by a reduction in class differentials in heights, both attesting to declines in chronic hunger.

When, however, we turn to India or other colonised countries, there is almost complete consensus not only that overpopulation is the cause of both poverty and diseases – Malthus resurrected in a new avatar as the colonial and continuing drain of resources is forgotten – but that the McKeown model is absolutely irrelevant as solutions to health problems are sought in medical technology alone. The faith in the magic bullet approach to medical technology, or a commitment to a germ-centred health history, is not confined to health professionals.

Kinglsey Davis in his classic *The Population of India and Pakistan* perhaps set the trend, to be taken up by other 'dismal scientists', demographers. He argues that the gift of "death control technologies" from the west was responsible for the decline of the death rate in the country. Perhaps picking up from Davis, *The Cambridge Economic History of India*, in its chapter on population, assumes that the post-1921 decline in the death rate was due to measures of public health: while plague somewhat mysteriously subsided, cholera and small pox were vanquished by public health intervention. Indeed this understanding even colours the Marxist economic history of Amiya Kumar Bagchi who observes "the fall in mortality...seems to have been caused by spectacular advances in medical technology for controlling such bacterial diseases as malaria, small pox and cholera" [Bagchi 1982].

This disjunction between health and socio-economic development which is said to have occurred in developing countries, has led to a veritable cottage industry among academics – and indeed policy-makers in influential places such as the World Bank – with the 'paradox' or 'miracle' of Kerala. What baffled them is how an economically poor state achieved health indices on par with the developed countries of the world. And indeed most analysts attributed the 'paradox' to the development of health services or female literacy. But what Kerala also appeared to prove to these analysts was that socio-economic development is no more necessary for improvements in health to occur. But this paradox, contends the author, is simply an outcome of the manner in which the question is posed. This is fundamentally flawed since "development was implicitly identified with economic development alone, measured in terms of per capita income".

Recalling Sen, he argues that "ultimately development can be seen in terms of what people can or cannot do: whether people can live long, escape avoidable mortality, afford better nutrition, etc". Critiquing approaches to development based on measuring incomes, the author attempts to "identify inter-sectoral linkages in development, and, in the process, to explain inter-state variations in health status in India". Towards this end he evolves a composite index of development utilising 39 indicators of health care, education, status of women, the development of infrastructure and overall economic development.

In order to unravel whether health status improves as a result of development of health care services or overall socio-economic development, data from the Censuses of 1961, 1971 and 1981 are utilised in this analysis. The ranking of states by the composite index of development reveals that "Kerala's performance was superior to all other states...Its position was consistently high across different sectors in all the years. After Kerala, a consistently better performance was achieved by Tamil Nadu." It is thus no surprise that Tamil Nadu is also undergoing a demographic transition despite not having levels of female education that was considered necessary from Kerala's experience.

The BIMARU states of north India, on the other hand, had done extremely poorly on all scores. The results indicate that there is in fact nothing paradoxical about Kerala's achievements. When "development is measured exclusively in monetary terms, Kerala and Tamil Nadu were reduced to the seventh and eighth positions on the development ladder" while in terms of the composite index of development, they take the first two positions. Equally significant, "the indicators of health status were more closely associated with development when it is measured in terms of overall socio-economic development". Among the various components of development, the development of infrastructure and overall economic development was more closely associated with health status. Thus health services alone have a limited role in determining the health status of people.

What the analysis indicates is the salience of comprehensive socio-economic development in shaping the health of populations. Technical interventions which seek to, in Raynaud's famous phrase, remove society from disease, are merely palliatives [Raynaud 1975]. *Health and Development* thus makes a convincing case for the continuing relevance of the McKeown model for developing countries also.

This is particularly cogent in the present conjuncture when health policy interventions are being shaped around the world by the World Bank which believes that problems related to the distribution of wealth in a society can have solutions in health technology, that health technical interventions offer a magic wand to a plethora of social problems stemming from poverty. Arguing that this is hubris for those swayed by the wayward charms of neo-liberalism, the book makes a case for learning from history. It should be of profound importance to public health scholars, development economists and policy planners.

Indoor Air Pollution: A Reflection on Gender Bias

Jyoti Parikh
Kirk Smith
Vijay Laxmi

Women and children below five years are among the most affected due to pollutants released during the burning of bio-fuels in traditional stoves. While there has been some attempt to reduce such exposure through the introduction of appropriately designed stoves, a better solution would be to redesign the petroleum policy such that kerosene is easily available to people at affordable prices. This would not only ease the pressure on forests and other bio-fuel resources but also have a positive effect on the health of women and children.

INDOOR air pollution due to cooking with bio-fuels is an issue that needs to be addressed through energy, environment and health policy. Many people associate air pollution only with urban outdoor environment, but some of the highest concentrations of pollutants actually occur in rural indoor environment. They come from burning bio-fuels such as wood, agriculture crop residues and dung cake, which are used by mass households in India. Women and children who stay with them during cooking are the silent sufferers. The possible solutions to this problem are to use efficient and smokeless stoves in the kitchen or better, use clean fuels. Is it difficult to provide the clean fuels for cooking because of macro-economic considerations or is it just neglect built into allocation policies reflecting a gender bias? This article discusses health impacts of bio-fuels used for cooking and strategies to reduce the impact.

I
Introduction

The 1991 Census showed that about 75 per cent of Indian households still rely on bio-fuels, such as wood, dung, and crop residues, for cooking and heating purposes. Burning unprocessed bio-fuels in traditional and inefficient stoves generates large amounts of air pollutants. From a health standpoint particulate, carbon monoxide, and a range of organic compounds including formaldehyde, benzene and benzopyrene are especially important. Mineral coal produces many more pollutants, but fortunately it is not widely used in India.

Pollutants released indoors are far more hazardous than those released outdoors because of the close proximity of people. Therefore, a bit of pollution released indoors is far more likely to reach people's lungs than if released outdoors. Typical pollutant levels during cooking hours in Indian houses are very high. Even 24-hour levels in many millions of homes apparently exceed those in the worst polluted cities. Carbon monoxide levels exceed the permissible levels of standards, but not by as large factors as do particulates. Table 1 shows particulate concentrations in personal breathing area during cooking hours in Indian kitchen which is approximately 20 times more than Central Pollution Control Board standards of 140 $\mu g/m^3$ annual average and daily average of 200 $\mu g/m^3$ in Indian residential, and rural areas.

High exposure to these pollutants has been associated with serious health problems as shown in many studies (Appendix 1) Major diseases associated with it are acute respiratory infections (ARI), chronic obstructive lung disease such as chronic bronchitis and lung cancer, and possibly tuberculosis, adverse pregnancy outcomes, blindness, heart disease and asthma.

In India, the most important disease with indoor air pollution is probably ARI, a class that includes infections from a wide range of viruses and bacteria, with similar symptoms and risk factors. As shown in Table 2, ARI plays a prominent role in the Indian national burden of disease (NBD). ARI is the single largest disease category nationally, being responsible for about one-eighth of the NBD, and affects mainly young children. At the global level also ARI is the largest single disease category that comprises about 'one-ninth' of the global burden of disease (GBD). The importance of Indian is illustrated by the startling statistic that ARI in Indian children under 5 alone is reponsible for 2 per cent of the entire GBD. There are a number of important risk factors for ARI, of course, in addition to air pollution, poor nutrition and crowding probably being the most important. The earliest observations related to biomass smoke pollution were made by doctors in the Indian medical literatures. They noted the odd fact that many rural Indian women developed severe types of chronic obstructive pulmonary diseases (COLD), in spite of not being smokers. Indeed, so severe are many of these cases that they lead to a dangerous heart condition called *cor pulmonale*, which in men is almost entirely confined to smokers.

Besides health problem there are many other negative externalities of using bio-fuels [Parikh 1995]. It has been argued that access to clean fuels should be considered as an indicator of human development (Apendix 2).

Estimates available from a recent study on annual premature deaths to children under five years of age and adult women, are in the range of 4,10,000 – 5,70,000 (Table 3). These estimates are only for these two groups of population and for specific diseases, there are certainly effects in other population groups and from other diseases also. The study also shows that ARI dominates (Figure 1) years of lost life (YLL) because of the young age of its victims [Smith 1998].

These estimates may seem shockingly high. However, it should be noted, that they are in line or even conservative in comparison with estimates for the cities in the US, of close to 60,000 annual deaths from ambient particulates [Hilts 1993; Shprentz et al 1996]. Compared to the Indian rural population, the US urban population is 2.6 times smaller (625/240), experiences average particulate levels 5-10 times lower, much higher health and

nutrition status, and has a lower overall mortality rate (which is the basis of the mortality calculations for such risk factors).

How is it that despite such a major impact, this issue is so rarely discussed and so little understood by the public? Even women themselves do not think of complaining, as this has been a way to cook for centuries. This does not mean that health risks did not exist in the past. Life expectancy has been very low and infant mortality rates very high in the past [HDR 1990]. They are only recently improving. The case of cigarette smoking comes to mind where the dangers were not understood for many decades even in the developed countries with high literacy levels, high awareness and substantial budget for health research and care. The risks of passive smoking have been only recently understood. Since relatively little research has been done in village households, it is not surprising, therefore, that the indoor air pollution in the rural areas have not received due attention. Another example is the slow recognition in human history of the importance of personal hygiene and dirty water in health. Indeed, in many parts of the world, bathing was actually considered unhealthy. It is unfortunately quite difficult for normal human senses, unaided by expert opinion and scientific evidence, to perceive the scale of many environmental health threats where there are multiple risk factors and delayed consequences.

Despite uncertainties in assessing the impact of indoor air pollution, it is now appearing that in India and other countries where solid fuels are used in simple stoves, indoor air pollutants may rival unsafe water as a cause of ill health. The indoor concentration of pollutants can be reduced by
- improved ventilation in the cooking area;
- better stoves which require less fuel and generate less smoke; and
- clean fuels for cooking.

Improved biomass stoves and improving ventilation are likely to be most cost-effective options for near and mid term. But in the long term, the option is transition to high quality liquid and gas fuels for cooking. In general there is a preference for cleaner fuels, and a transition to clean household fuels comes as a natural consequence of economic development. Such a transition can be accelerated if clean fuels are made available and cheaper.

II
Improved Ventilation

By improving ventilation in kitchens one can reduce the suspended particulate matter (SPM) concentration to which people are exposed. This option, however, may not be available to many poor people living in small and crowded homes. The cost may be high too. Also since improved ventilation does not reduce total SPM emission, it can only be a short-term solution of limited applicability. Yet awareness about the dangers of indoor air pollution should be spread so that women do whatever they can to reduce their exposure. Since smoke causes much discomfort women even when they are unaware of the health impacts are most likely to be already taking these measures. Scope for further improvement must be limited and other policies are needed.

III
Design and Dissemination of Truly Smokeless Stoves in Cost-Effective Manner

Improved smokeless stoves help in two ways, they reduce the fuel needed to cook and consequently reduce the smoke per kilogram of fuel burnt by efficient combustion. Development and dissemination of truly improved stoves on a wide scale has not been easy [Smith 1989]. The Indian improved stove programme, which began in the early 1980s and has focused more on fuel efficiency than smoke reduction, has had some successes, especially in the later years. Much remains to be done,

Table 3: Estimated Annual Premature Deaths from Indoor Air Pollution in India

I	Strong evidence:	3,10,000-4,70,000
	Acute respiratory infections - Age <5 years	
	Chronic obstructive pulmonary disease - women	
	Lung cancer from coal use - women (few in India)	
II	Moderate evidence:	50,000-1,30,000
	Blindness - Women (no death)	
	Perinatal effects (insufficient data for estimate)	
	Tuberculosis - Women	
III	Suggestive evidence:	50,000-1,90,000
	Cardiovascular disease - Women	
	Asthma (few in India)	
Gross total of all three categories:		4,10,000-7,90,000*
Total range chosen for this report:		4,10,000-5,70,000
This consists of the full range of category I plus the low end of the ranges for categories II and III.		
Best estimate:		5,00,000

* Total annual deaths in India for women and children under 5 in these disease categories in the early 1990s: 23,00,000. For all deaths, the Indian total was about 95,00,000.

Source. Murray and Lopez (1996).

however, as only 15 per cent of rural households had adopted improved stoves by 1992. A survey showed that one-third of the ICs installed became non-functional within the first year of installation [Saxena 1997]. Perhaps some important lessons can be drawn from the most successful of the world's improved stove programmes, that of China, which has introduced more than 160 million improved stoves by 1991 covering 70 per cent rural households since the early 1980s [Smith 1993]. The Chinese and Indian experiences are compared in Appendix 3 using relevant information from Smith (1993) and Saxena (1997).

The economics of health improvement from reduction of indoor air pollution can be seen by comparing the relative cost of improving health through improved stoves, with the other available means. It shows that in order to be cost-effective, a smokeless stove needs to have a lifetime of at least 10 years. Figure 2 illustrates the costs of increasing one healthy life-year at different discount rates and stove lifetimes. For example, if a truly smokeless chulha could be introduced at a cost of Rs 2,000 with a lifetime of 15 years, the cost of saving one life-year would be about Rs 1,200 at the social discount rate of 3 per cent. This might be compared, with typical costs for increasing one healthy life-year by other health measures in the country (Appendix 4). The cost of indoor exposure reduction seems to be within the range of the cost associated with other measures to improve health. This is even without considering the other benefits associated with improved stoves, e g, reduction in fuel consumption due to improved fuel efficiency, reduced pressure on local biomass resource, hosehold cleanliness, etc

The existing improved stove programmes in India have typically tried to introduce stoves costing no more than a few hundred rupees. As compared to this, Rs 2,000 may seem excessive. It should be noted, however, that it represents the real effective cost per average stove successfully introduced. In other words, it accounts for all the dissemination costs (research, development, marketing, etc) by the government and other organisations, and the inevitable fraction of stoves that are never used, abandoned, or broken after short periods. Thus, the stove may be priced at Rs 1,000 and still have an effective price of Rs 2,000 each when all the costs are included. Such a price also recognises the importance of introducing stoves that have long lifetimes, i e, are made of sturdy materials and constructed by professional artisans. Only such long-lived stoves can meet the cost-effectiveness criterion above. Only with professionals and sturdy materials can stoves be made that are reliably smokeless over long periods. Experience in such widely divergent societies as rural Nepal and highland central America has shown that even very poor populations are willing and able to participate in the purchase of really effective devices that they believe add value to their households and quality of life. Our improved stove programme needs to be restructured to take care of local needs of the people and designing it scientifically. As in case of China, instead of relying on local artisans and local materials, China's programme has relied on centralised hi-tech manufacture of critical components of combustion chamber for installation at the household into the stove body. While improved stove slower emissions and reduce exposure they do not eliminate it. In the long run, bio-fuels in the rural areas would have to be replaced by cleaner fuels as used in the urban areas and the richer households in some villages.

IV
Increased Access to Clean Fuel

Increased availability of clean fuels such as biogas, solar stoves, kerosene, liquid petroleum gas (LPG) or electricity, etc, can also reduce indoor air pollution. Biogas plants design need to be further improved to make them sustainable with just a few cattle or buffalo. More work is needed to develop reliable cost-effective community designs and evolve effective institutional arrangements to operate them. For making solar cooker more widely acceptable, improvements in the design of the cooke is needed so as to make them less expensive and more convenient to use. Since LPG, propane, butane are in limited supply and involve movement of heavy cylinders thei use is restricted in rural and remote areas They also require expensive stoves. Electri city is also not reliably and economicall available in rural areas. Therefore, kerosen is the next preferred fuel that is clean convenient, controllable and transportabl for cooking. It is well known that its avail ability in the country is not adequate Currently, the average per person use i about 12 liters per year as against th requirement of 50 liters per year if al cooking is done by kerosene. Promotin the use of coal has also been proposed a an effort to reduce the pressure on biomas resources.

Sectoral Fuel Allocations

How much kerosene would be require to eliminate wood fuels? What is the magni tude of the required supply? Can clea fuels penetrate rural markets? Would thi

impose a high burden on oil imports? How much oil is consumed by other sectors? What are their shares and growth rates? Is it difficult to provide extra kerosene for cooking from macro-economic consideration or is it just neglects built into allocation policies over decades reflecting gender bias?

An additional 10 mt of kerosene or LPG is required to replace bio-fuels in 50 per cent of households currently using it. This figure has been arrived at assuming combustion efficiency of kerosene and LPG as 40 per cent as compared to 5-10 per cent in case of bio-fuels. The question may arise that whether there is adequate purchasing power in the rural areas to absorb more kerosene? We are looking at kerosene, as LPG is still a cooking fuel only in urban areas. A survey conducted by National Council for Applied Economics Research shows that rural markets are growing and the gap between consumer tastes in rural and urban households are narrowing. The share of rural market in total consumer durable has risen from 54.2 per cent in 1989-90 to 57.9 per cent in 1995-96. The share of high value items (above Rs 6,000) has also risen. VCP and VCR moved from less than 5 per cent of rural share in 1989-90 to 20-30 per cent by 1995-96. Low priced goods like bicycle, transistor/radio, mechanical wristwatch have market share of over 75 per cent in rural areas (*The Economic Times*, 1998). This does not mean that a large fraction of rural population owns these but that they control sizeable overall market share. If there is intra household equity, where their preferences determine household consumption basket, kerosene should certainly find a place. Thus, in the rural area there is purchasing power. These potential consumers with willingness-to-pay can be switched to commercial fuels from non-commercial fuels, and this will release pressure on the poor who cannot afford to buy commercial fuel. Even if 5 per cent to 10 per cent women shift to open market kerosene from fuel wood, there could be less shortage of fuel wood. Moreover, the burden on subsidised kerosene could also reduce.

The fact that adequate kerosene is not available even for households who can afford it reflects the low priority given to the need for cooking fuels by millions of households. Given the adverse health impact described above, it should get as much priority as the other sectors, if not more. It seems that large commitments of 10 to 20 mt of oil use have been made in other sectors such as transport and recently, power sector.

In 1995-96 cooking fuels accounted for only 19.3 per cent of total consumption of petroleum products (Table 4) where as transport fuels accounted for 55.5 per cent (*Annual Report*, 1996-97). The consumption of kerosene in 1995-96 was 12 litres/year per person, approximately one-fifth of the normative requirement (i e, 50 litres/person/year). The projected demand also reflects the same scenario in government policy, as demand growth during 1997 to 2002 is 6 per cent and 6.5 per cent per annum respectively for diesel and gasoline, whereas, for kerosene this is only 4 per cent.

Similar commitments of petroleum products are also made in power sector. Recently, the ministry of petroleum and natural gas has allocated nearly 20 mt of liquid fuel to power sector (CMIE, July 1997). The rate at which petroleum fuels are rising in other sectors show that the country has far less priority on women's health especially in the rural areas.

To fulfil kerosene demand, country would need to examine its import policy for petroleum products to incorporate the demand of the rural households that mostly rely on biomass fuel for cooking.

Table 5 shows that during 1991 to 1996 the diesel imports went up from 4.7 mt to 12.8 mt (63 per cent increase) but the kerosene imports went up from 3.3 to 5 mt only (35 per cent increase). The proportion of kerosene in total import of petroleum products is continuously declining and dropped to 26 per cent in 1995-96 from 42 per cent in 1990-91 in value terms. On the other hand for the same period, proportion of import of diesel in value terms increased from 49 per cent to 62 per cent. Thus, with limited foreign exchange the government imports enough diesel but not kerosene despite very high suppressed demand. It is true that diesel is used for 'productive' purposes from which more revenue can be earned but the kerosene requirement to satisfy all the needs for cooking is not large on a normative basis. As mentioned earlier, another 10-12 million tonnes of clean fuels can replace bio-fuels used inefficiently today for 50 per cent households. When burden of diseases caused due to use of dirty fuels is accounted and when benefits of increased productivity of women are considered, it makes sense to compare them as an example of the priorities. Furthermore, use of diesel for transportation has many negative impacts also, like, cost of air pollution, opportunity cost of land use for roads and parking spaces, etc, which need to be added to its price.

It is clear that there is shortage of commercial fuel for cooking. Even those who can afford to pay for kerosene do not get it because of limited supply. Ironically, it is possible that subsidised kerosene is the reason for its non-availability. First, low or zero trade margins give traders no incentives to keep kerosene in their shops. Secondly, some amount of subsidised kerosene disappears from market and reappears in open market where it sells at a price two to three times (Rs 7 to 10 per litre) of the subsidised price (Rs 2.90 per litre). The government has included kerosene under open general licence (OGL) but private sector has not yet entered in a big way due to problems involved in shipping, storing and transporting, and because it is a new business for them. The

reasons for market failures need to be understood and addressed.

Efforts should be made to increase per capita availability of kerosene at least in the rural areas, and we might be able to reduce burden of diseases suffered by majority of women and children. Of course, kerosene may penetrate slowly and not overnight, say in 5 to 10 years. This gradual increase will give time to adjust even with other interventions to reduce indoor air pollution like technologies for procesing renewable biomass into other clean burning fuels. The goal should be to use gaseous and liquid fuels in the stoves, which are clean.

Substitution of Household Biomass Fuels with Coal

In a well-meaning effort to reduce the pressure on forests and other biomass resources by household fuel demands, it has been proposed to promote the substitution of coal as a household fuel. Although such a plan has some potential benefits, great caution should be exercised because of the health risk involved. Extensive recent researches in China and South Africa and older studies in the UK and elsewhere demonstrates quite clearly that coal use by household's leads to dramatic health problems. For example, China has the highest lung cancer rates in the world for non-smoking women because of the extensive use of household coal. Although it is possible to wash and process raw coal into cleaner-burning forms, it is not clear that sufficiently clean burning can be achieved at a cost competitive with the already well established cleaner fossil fuels, kerosene and LPG.

V
Conclusions

The pollutants released due to use of bio-fuels for cooking in traditional stoves cause serious health problems like acute respiratory infections, chronic obstructive lung disease, lung cancer, tuberculosis, etc. Women and children below five years of age are most affected, as they are regularly and severely exposed. There is a need to pay more attention to the plight of hundreds and millions of women and children living daily with exposure to indoor air pollution. Many actions are required to address this air pollution. A short- and medium-term solution is to design and disseminate efficient smokeless stoves in a cost-effective manner. Effective price of such a successfully installed stove is approximate Rs 2,000 with a lifetime of 15 years, which may seem to be very high as compared to stoves currently, installed under government programmes. But it should be noted that these less expensive stoves have a high failure rate and a very small lifetime, and do not offer good efficiency.

While improved stoves reduce the pollution exposure, they do not eliminate it. In the long term clean fuels would be needed not only to reduce pollution but also to provide convenient and controllable fuels by increasing availability of clean fuels in rural and remote areas. Since LPG, propane, butane are in limited supply and require heavy initial investment for bottling plants and cylinders, and availability of electricity is not reliable and economical in the rural areas, next best alternative is kerosene. There is a need to change the petroleum product policy in a manner to make kerosene available, to the people who are willing and are able to pay for it, in the open market at an affordable price. Government should reformulate its policy to make parallel marketing system for kerosene effective and successful. This will reduce the burden of diseases suffered by a large number of women and children, and will also ease the pressure on forests and other bio-fuel resources. When the segment, which can pay, is dealt with the poor who cannot afford to buy commercial fuels may have less pressure. More surveys and analytical work is needed to devise cost effective strategies and comparison of alternatives. High occurrence of indoor air pollution signifies inequalities in environmental policies, energy policies and health policies.

Appendix 1

Wood-smoke exposure and risk for obstructive airways disease (OAD): A study conducted at Bogota, Colombia showed that among elderly women of low socio-economic status, wood-smoke exposure is associated with the development of OAD and may help explain around 50 per cent of all OAD cases. However, the role of passive smoking remains to be clarified.

Cooking smoke increases the risk of acute respiratory infection (ARI) in Children: The survey result of National Family Health Survey (NFHS) of India 1992-93 shows that one in every fifteen children under age three suffers from ARI in India. At the same time, about three-quarters of households in the survey reported using wood or animal dung as their main source of energy for cooking. Children under age three living in households that use wood or animal dung as their primary source of cooking fuel have almost one-third higher risk of ARI than the children living in households that use cleaner fuel, even after controlling for a number of other variables.

Bio-mass fuel and blindness: Analysis of the NFHS data showed that adults over 30 years living in households using biomass fuel had about 30 per cent more partial blindness than those living in households using cleaner fuels. There was no statistically significant difference for complete blindness, however. Cataracts are thought to be caused by cumulative damage to the lens of the eye, which can occur through exposure to cigarette smoke or sunlight, and drying due to episodes of diarrhoea, among other factors. In addition, however, other causes of blindness may have links to biomass smoke. Trachoma, for example, is caused by infection of the eye, which might be enhanced if people are rubbing their eyes due to irritation by smoke. Conjunctivitis, another source of blindness, is thought to result from long-term irritation such as might occur due to the aldehydes, acrolein, and other irritation such as might occur due to the aldehydes, acrolein, and other irritating chemicals in biomass smoke.

Tuberculosis: Adults over 30 years living in biomass households had 170 per cent higher TB rates than those in cleaner households. This is an unexpected finding, which, if confirmed, would have major public health implications because of the terrible toll of TB in India and elsewhere in the developing world.

Appendix 2: Access to Clean Fuels for Cooking – A Human Development Indicator?

Air pollutants due to bio-fuels are largely released directly where the people are inside or near households at mealtimes every day. Therefore, even with modest emission levels, the actual exposure to people is significant in many millions of households around the world.

Several health effects are suspected: respiratory infections in children, chronic lung diseases and lung cancer in adults, and adverse pregnancy outcomes, such as low birth-weight and stillbirth, for women exposed during pregnancy.

Acute respiratory infections (ARI), often as pneumonia, are the chief cause of death of children under 5 years and the largest single cause of lost life years in the world as a whole. Together, the complex of ill-health composed of the inter-related problems of ARI, diarrhoea, and the childhood diseases such as measles, are the main reason that developing-country children under 5 bear about half the total burden of ill-health in the world, although only making up about 10 per cent of the population.

A recent study in Colombia found that women cooking over open fires had almost four times more chronic lung diseas compared to those cooking in other fashions. If applicable to the population as a whole, about half of chronic lung disease in Colombian women could be due to such exposures. A study in the Gambia found that infants who were exposed to smoke by being carried on their mothers' backs during cooking were nerly 3 times more likely to develop

significant cases of acute respiratory infection. In the same community, girls under 5 who were present during cooking had about six times more risk of this disease than those who were not in the cooking house. These risks were determined after correcting for the effects of socio-economic status, nutrition, and other factors known to affect disease rates.

Therefore, to reduce indoor pollutant exposures to acceptable level access to clean fuels is required for the health of women and children. Other methods are, efficient stoves, enhanced ventilation etc, but they are short-term solutions. The use of clean fuel is the most effective solution and long-term solution. Should access to clean fuels for cooking not be used as indicator for human development?

Based on: Jyoti Parikh (1996): 'Poverty Environment and Development Nexus', Human Development Report, UNDP.

Appendix 4: Costs of Avoiding Loss of One Healthy Life-Year in India

- Measles vaccination: $15-20
- Food supplement for pregnant women: $20-30
- Food supplement to children under 5:$60-70
- Tobacco and alcohol control: $40-50
- Clean water: $50-150
- Basic care for AIDS patients: $200-400
- Leukemia treatment: $1,000
- Environmental control for Dengue: $2,000
- Improved chulha: $30

Note: The costs are only estimates. They considered the cost of the entire programme for the probability that risk is reduced by one life-year.

Appendix 3

CHINESE IMPROVED COOK-STOVE PROGRAMME (ICP) vs INDIAN ICP

Chinese Programme	Indian Programme
Initiated in early 1980s and covered almost 70 per cent of rural households by 1991 without any direct subsidy by the government.	Initiated in early 1980s and covered 15 per cent rural households by 1992. The ICs were highly subsidised by the government.
Strategies	
1 Work in the best areas first. The programme should first be initiated in those areas where people show their desire for improved cook-stoves (ICs). The selection of site was made on the basis of the country's desire to become a pilot county for the ICs programme along with other considerations such as fuel shortages, and managerial, financial, technical and raw material resource availability in the county.	1 The political and bureaucratic pressures have led to attempts to implement the programme extensively from the start. Therefore, in some areas where people were not willing to accept or were not ready to manage ICs were provided ICs, as well as in many areas people those were ready and have desire for ICs were not able to receive it.
2 Research and development was directed mainly towards design and modification of stoves to match local conditions of fuel and cooking/heating needs.	2 Local people's requirements were not taken into consideration.
3 Regular, systematic and consistent monitoring and evaluation has been an integral part of Chinese Improved Stove Programme since its inception.	3 Monitoring and evaluation is not there.
4 The government contribution is much smaller (about 15 per cent) and restricted mainly to training, administration and promotion.	4 Government contribution is about 50 per cent.
5 Flow of money between the bureaucratic levels is minimal. The largest single flow that can be transmitted in a year as part of centre and county contract would seem to be $ 3,000 only.	5 In India flow of money is huge, i e, US $ 2,50,000 per year from centre to state nodal agencies and on down line.
6 Centralised production of the critical parts of the combustion chamber for reliable long-term high efficiency performance of the stoves.	6 Efficiency and reliability of stoves are very low.

Note: Summarised by the authors from Smith (1993) and Saxena (1997).

[This paper arises out of work done under capacity building project supported by United Nations Development Programme, and executed by ministry of environment and forests and implemented by Indira Gandhi Institute of Development Research.]

The Future of Anthropology

Vinay Kumar Srivastava

This paper submits that practical concerns have overtaken the theoretical in contemporary anthropology, especially in India. A perilous consequence of this trend is that instead of illuminating the functioning and dynamics of society and culture in particular and general terms, it confines itself to the question of policy prescription. By directing their energies to the 'issues of usefulness', anthropologists have come to think that the future survival of anthropology is incumbent upon its immediate market value. The future of anthropology can be enhanced, instead, by giving primacy to an interpretive understanding of societies and cultures, thereby making comments on existing policies for development and social justice more perceptive and relevant.

THE future of their discipline, or one of its offshoots, has seriously concerned the anthropologists. Several seminars and workshops have been held under the aegis of 'retrospect and prospect' or the 'relevance of anthropology', where thoughts of the possible futures of our subject have figured. One of the topics of addresses and discussions in the centenary meeting of the Royal Anthropological Institute of Great Britain and Ireland (RAI), the proceedings of which appeared in *Man* in 1944, was 'The Future of Anthropology'.[1] Murray Leaf's *Frontiers of Anthropology*, a book of 1974, carried a chapter in the end, on the 'anthropology of 2000' (pp 311-24). The statement – 'Anthropology has a notorious past, dismal present, and uncertain future' – broadly summarises our collective anxiety about the integrity of our discipline and its survival [Srivastava 1986]. In other words, regardless of the time and the progress of anthropology, its professionals have often pondered over its future

Questions of the future begin zooming large when a culturally-constructed time period is to be replaced by another. One may imagine how bold and big this question would be when a century is to be replaced. In the 1990s, many contributions have appeared on the future of anthropology: some important ones are by Hart (1990), Kahn (1990), Sponsel (1990), Firth (1992), Grimshaw and Hart (1993), and Giddens (1996). None of these writers even hints that anthropology is devoid of a future. That we are contemplating the future itself strikes a chord of optimism: there is a future *of*, *for*, and *in* anthropology. But, where does it lie? In theory or policy prescriptions, or in a better, evolving relationship between the two? In making the discipline frontierless, unbounded, or in a precise delineation of its aims? What is our vision of future for which anthropology should be made to work? [Hart 1990: 14; Firth 1992: 208].

Why does the question of their discipline's future worry anthropologists? To my knowledge, such a question is generally not raised in other subjects.[2] Is the crisis in anthropology, wherein storms the debate about its future, imaginary? Is it simply a panic button so that the quality of research improves with continued introspection? In a strongly-worded article, Keith Hart (1990:14) says that British anthropologists are 'overspecialised, fragmented, alienated from the society in which the majority of people live,' and they lack 'any vision of [their] own or humanity's future'. This has also been the conclusion of many observers of national anthropologies [Pathy 1981; Gerholm and Hannerz 1982; Hastrup 1987; Mahajan and Srivastava 1978].

Today, anthropology discovers itself in a multicultural world of reflexivity which 'demands new forms of inventiveness and subtlety' [Clifford 1986:23]. We are sceptical of and wish to enquire into 'all grounds of authority, assumption, or convention' [Fischer 1986: 194].[3] Knowledge-producers in the contemporary world are not just academic professionals. Journalists, media persons, tele producers, film makers, and even bureaucrats, are concerned with all those social issues on which we anthropologists claimed intellectual monopoly some years ago. A programme, for instance, on the Yanomamo Indians made and telecast by Discovery Channel, is not only worth thousands of words, but reaches millions of cross-cultural viewers [refer Giddens 1996: 121]. Today, anthropology finds itself in the midst of myriad theoretical perspectives, the contest between them is not like the blood-feud which characterised the relation between the descent and the alliance theorists in British anthropology. Contesting paradigms co-exist today with exemplary tolerance of another's vantage point. These are the times of post-modernity, post-structuralism, post-colonialism, post-savage, post-positivism; or as Geertz (1998:69) says, of 'post-everything'. Anthropology faces a set of new challenges in this world.

Against the background of the contemporary practice, this paper outlines the conditions which will affect the future of anthropology. Not offered here are the tasks for the 21st century. Unless adequate steps are taken, the already existent crises of ecosystem, resources, society and culture are bound to escalate with the passage of time, and the anthropological researches will be expected to understand the genesis of these crises and suggest remedies. The practising anthropologists are hopeful about the contribution their discipline can make to ameliorate human condition. Marketability of anthropological skills (especially fieldwork) has been recognised by development and welfare organisations, but the full potentiality of the subject is yet to be tapped.

So far, a study of the impact of anthropology on its learners has not been carried out, but I learnt from my students that anthropology brought about a marked difference in their orientation to life.[4] They developed a higher degree of sensitivity to other human beings and their problems, besides trying to understand the 'other' (a fellow being, a community, a group) in holistic terms. Some Indian bureaucrats, who read anthropology as one of the subjects for the civil services examination, told me about the profound impact that anthropology made on them. In their actual workings, they have become comparative, analytical, field-oriented, and contextual. Now they understand human predicaments in a better perspective.[5] Yet, anthropology is not the first subject-priority of a college student who casts his eyes on courses which promise him a lucrative profession.[6]

At the outset, I submit that the future of anthropology will depend upon its conception that we hold and reproduce didactically. If its vision is of a discipline

without frontiers, then we have already started ringing its death knell. Further, anthropology's future is conditioned by the sound analytical and theoretical perspectives that we are able to generate. We cannot sustain it by an array of policy suggestions, the long list of pleas, viz. 'what should be done?' A dialectical relationship exists between theoretical conclusions and the areas of application. In it rests the strength of anthropology. We also note with concern the woeful decline in the quality of fieldwork (especially by Indian anthropologists and neophytes) and in the sophistication of analysis.

II

In 1978, six young anthropologists from the University of Delhi, three each from physical and social anthropology, decided to launch a journal with their pooled resources titled *Spectra of Anthropological Progress*. Its acronym *SAP* acquired popularity in academic circles in years to roll. These men were crystal clear about their aim. They did not want to merely add another volume to gather dust on the library shelves. They were deeply concerned with the question of *quo vadis*: whither goeth anthropology?[7]

The inaugural issue of *SAP* (1978: i-iii) carried a brief editorial which spelled out the direction anthropology had taken, its overspecialisation, concluding that the specialised research did not quite connect itself with the central aims of anthropology. Twenty years later, Bhattacharya (1999: 24-5) observed that the 'distancing of archaeology from anthropology has now gone to the ultimate. It is a consequence of this that archaeologists are now trying to have their own agenda of ethnology which need not concern itself with cultural themes.' The likelihood of unconnected and ceaseless specialisations existed in anthropology, because, to begin with, it dealt with two facts – the biological and the cultural – and each one of them could become the pivot of a separate discipline with its distinct methodology, terminological apparatus, and epistemology. The relation of the observer with the observed is bound to be different in a biological science in contrast to a socio-cultural discipline.[8]

The *SAP* editors did not denigrate the tendency of overspecialisation, seeing it as an index of the progress and development of a subject. However, they advised the specialists to think carefully of their grounding in the parent discipline and relate their specialisation to it. Otherwise, the specialist's work would become alien to the anthropological concerns. Moreover, he would be marginalised in other disciplines he intends to venture into. If this differentiation of the discipline is permitted to go unchecked, with no attempt to integrate the new branches with the goal of anthropology, the danger is that the specialisations will fall apart. The Spencerian proposition – 'Integration compensates for differentiation of parts' – asserts the truism. Anthropologists should devote themselves to the task of integrating their discipline. Each stream of differentiation must relate to the central aims of anthropology. If we proceed in this manner, a higher differentiation of the discipline will inevitably imply a higher degree of integration.

A discipline should not be allowed to become pigeon-holed, for this would render intense inbreeding, thus lowering its creativity and scholarship and eventually, making it sterile. At the same time, let it not become so porous that, as in our case, almost every biological, sociological, or cultural study of humans could claim a place in anthropology. We already know of health scientists, historians, experts in foreign affairs, journalists, film makers, and many others, who not only call themselves anthropologists, but compete with hard-core anthropologists for scarce funds for research, tenurial positions, chairs of committees, awards, etc.[9] Osmosis is creative; flooding is destructive. We may borrow theories and techniques of analysis from other disciplines to understand our data better or to illuminate our concerns. But the crises, which the *SAP* editors called the 'identity crises', surface when a specialisation of some other subject is placed under the rubric of anthropology by an enthusiast without its relationship with the principal anthropological concerns being properly worked out.

It is not only with respect to physical anthropology that social anthropologists, or vice versa, find it difficult to maintain academic communication and to undertake collaborative research, but within social (or physical) anthropology, a number of branches have emerged which increasingly emphasise their separation. Each of these, what I would call, 'special anthropologies' (such as linguistic anthropology, medical anthropology, ecological anthropology, demographic anthropology, etc), which acquired prominence in the second half of the 20th century, interacts with another full-fledged discipline having its own history and preoccupations. Linguistic anthropology, for instance, has an intimate connection with linguistics, in the same way as is the proximity of ethnomusicology to the science of music.

Closeness to other disciplines applies to the main branches of anthropology as well; for example, the British social anthropology is considered closer to French sociology; and cultural anthropology, the American variant, to history and folklore. However, not all the practitioners of social or cultural anthropology assumed that their subject was a branch of humanities or one of the specialisations of the arts. Radcliffe-Brown (1948), the chief architect of British social anthropology, ardently believed that his subject was a natural science of society. Similarly, the American neo-evolutionist, Leslie White (1943) considered the natural science of culture as culturology, a term most dear to him. But these analogies between social or cultural anthropology on the one hand and natural science on the other, were based on an assumed isomorphism of methods and techniques. The methodology employed for the study of natural systems was extendible to social systems.[10]

The idea that social or cultural anthropology was a science of society or culture, or both as Kroeber's (1948:5) collocation socio-cultural anthropology suggested, did not imply its active interaction with biological or natural sciences. None of the campaigners of the scientific status of social or cultural anthropology ever thought of working out its relationship with physical anthropology (or archaeology), or of planning a study in which these branches could be meaningfully integrated. Radcliffe-Brown (1952) and Evans-Pritchard (1951) wrote extensively on the nature of social anthropology and the relation it bore with psychology, history, and sociology, but never chose to examine its kinship with physical anthropology or archaeology.[11]

It may be suggested that the relationship between social and physical anthropology in the British tradition was almost like that of the kinspersons who stood back to back. But, it did not imply any hostility or competition between them. Social and physical anthropology (and also archaeology) were non-interacting disciplines but sharing the same hearth. Social anthropology forged its alliance with sociology and history, whilst physical anthropology (which in Britain is called biological anthropology) shared common concerns with medicine and other biological sciences.[12] Anthropology, therefore, can be conceptualised as a myriad of disciplines having close contact with other independent subjects, rather than amongst themselves.

The pattern established in Britain at the beginning of this century has continued till date. Separate departments of physical,

social, and archaeological anthropology exist in British universities, and are placed under the faculty of anthropology. Interaction between these departments is negligible. Each one of them is almost like a *gemeinschaft*. Anthropology for the British is either biological anthropology, or social anthropology, or archaeology. The issue of its integration does not worry them. Nor do they engage themselves with the question of what 'anthropological' part in physical anthropology is homologous to the 'anthropological' quiddity in social anthropology? The British pattern is replicated in many other universities of the world. At the level of the work, the micro-studies take precedence over the philosophical discussions about a discipline's total identity, integration, and the boundary-maintaining mechanisms.

The American anthropology began with its division into physical anthropology and ethnology, the latter being further segmented into cultural anthropology, linguistic anthropology, and prehistoric archaeology. Physical anthropology studied bio-genetic facts, while culture in all its manifestations, and in spatio-temporal dimensions, was the key concept in ethnology. Although not clear in the beginning on how biological and cultural facts could be meaningfully integrated in a study, American anthropology nevertheless furthered its holistic conception. The textbook definition (almost like a 'holy litany') that anthropology is the 'study of man in all his aspects in time and space', seems to me an American view. The founders of professional anthropology in America insisted on an integrated anthropology. We are reminded of Franz Boas (1948) for whom fieldwork meant the collection of socio-cultural, archaeological, linguistic, and biological facts of a given people. This was the encyclopaedic approach to anthropology which is amply reflected in the American textbooks. Some American scholars have discussed the issue of the integration of anthropology at the level of the syllabuses, teaching and research seminars, and common projects and investigations [Tax 1956; Godelier 1974; Leaf 1974, 1979]. But they were all conscious of the fact that the subject was fast fragmenting. Their concern can be estimated from Eric Wolf's aptly-titled article: 'They divide and subdivide and call it anthropology' (*New York Times*, November 30, 1980).

Because of these divergent specialisations, which are strange bedfellows, anthropology has become a 'dilettante's discipline', including in its scope 'literally anything from lemur feet to shadow plays' [Rabinow 1977:3].[13] In a trenchant criticism of overspecialisation, Needham (1970:46) envisaged an 'iridescent metamorphosis' of anthropology. The field might be redistributed among many other disciplines.[14] Many authors have reconciled to the academic disintegration of anthropology and see their works as part of the 'metamorphosis' of which Needham spoke.[15] Anthropology today is a 'group of subjects'.[16]

III

Integration of anthropology has the following facets: first, certain aspects of human existence can be fully comprehended when equal attention is given to its biological and socio-cultural dimensions. Some 'special anthropologies' lie at the confluence of biological and socio-cultural anthropology; for example, ecological anthropology, demographic anthropology, medical anthropology, and the anthropology of development. Other anthropologies are preeminently biological, but use several socio-cultural factors and indices; anthropology of growth and physiological anthropology may be cited as examples. Even in highly technical fields such as foetal anthropology, one cannot ignore the political economy of health and various declarations of the international organisations (like UNICEF) [Chandra 1990].

In those specialisations which are at the interface, a restriction of analysis to either fact (biological or socio-cultural) is bound to be myopic. Medical anthropologists know full well that if illness is cultural, disease is a pathological concept. Pain is both a culturally-constructed reality and also, biologically inscribed on the body. The first lesson a student learns is that medical anthropology is a bio-cultural discipline. We analyse the medical system as a biological system and as a socio-cultural system, which we further break down, following the systemic approach, into social system and cultural system. In the integration of the three subsystems of the medical system can one locate the spirit of medical anthropology [Forter and Anderson 1978; for similar argument on Indian material see Joshi and Mahajan 1990, Bhasin and Srivastava 1991].

A similar argument can be adduced for demographic and ecological anthropologies. Some of us may be sceptical of the place I have given to the anthropology of development, for this specialisation is dominated by social anthropologists. Those who think that development has nothing to do with physical anthropology are mistaken because the issue of the biological survival of people is of utmost importance. We have a significant literature on the diseases caused by development, and how the health of the natives was jeopardised as a consequence of the measures the planners and development specialists thought were ameliorative [Kunitz 1994]. For depopulating tribes, the health-related programmes score priority over those dealing with cultural matters. Development is a bio-cultural phenomenon, and for the future survival of anthropology, this notion is crucial.

Besides this, another way to integrate anthropology is to generate a paradigm which can explain both the biological and cultural facts. In one such attempt, Mahajan and I (1978) examined the possibility of using dialectical materialism to integrate anthropology. Jan Wind suggested the use of cybernetics for a similar purpose (Personal communication, December 12, 1978). Neo-Darwinian philosophical traditions could also be explored [Ashley Montagu 1960, 1981]. Forde (1948) argued that ecology can unite physical with social anthropology. Howsoever promising these theoretical insights are, they have not become popular in our subject. Whatever integration is visible it is at the level of studies which require a knowledge of both physical and socio-cultural anthropology.

IV

One of the consequences of the American encyclopaedic approach is that anthropology has gradually become more and more porous and spongy, offering a respectable place to people from varied disciplines, but losing its identity in the process.[17] What has really been detrimental to its progress is the oft-repeated statement, pronounced with boastfulness and pomposity, that it is a subject without frontiers, without boundaries. The protagonists of this view present a catalogue of different anthropologies and show several empty shelves to the academic world where more and more specialisations could be placed.[18] We may beam with satisfaction on seeing a huge list of anthropologies, but in this process we have eroded the concerns of the discipline. The future of anthropology depends upon these pivotal concerns, and not on the unwieldy list of its specialisations.

Often, a question like 'what is anthropological' in 'economic anthropology', or in 'medical anthropology', or in any other 'special anthropology', is asked. We want to know the distinctions between collateral disciplines or interests – for instance, between political science, political sociology, political philosophy, and political

anthropology. Engaging debates ensue on whether the study of economic systems of tribes and peasants be termed 'economic anthropology' or 'anthropological economics'. Such taxonomic debates are in other specialisations as well. Some scholars believe that if we opt for titles such as 'anthropological economics', or 'anthropology of development', or 'ethnolinguistics', then we emphasise in them the anthropological content more than that of the other discipline with which they interact.

Whether or not we accept the suggestion about a proper nomenclature of the discipline or its branch, there is no doubt that such borderline or inter-disciplinary enterprises are required to interact with other disciplines. The student of 'anthropological economics' or 'economic anthropology' needs to acquire an arduous competence in economic theory and techniques of analysis. In a similar vein, an anthropologist of transcultural psychiatry is expected to be familiar with western psychiatry, its modes of treatment, and its concept of man. In such disciplines, the anthropologist has to do an extra labour – to gain competence in another subject. Dalton remarked that 'economic anthropologists' suffer from 'nervous inferiority' while corresponding their ideas with hard-core economists who tend to look down upon their counterparts in anthropology [Dalton 1971: 30]. Similar observations can be culled from the practitioners of other borderline anthropologies who have to interact regularly with other closely allied subjects. One would like to read a detailed account of the professional experiences of a medical or physiological anthropologist working in a hospital or medical college, and trying to justify his place amidst those who might consider such positions as sheer appendages, easily dispensable.[19]

Needham (1970:40) called an anthropologist's encounter with the other discipline(s) 'awkward'. It is bound to generate 'nervous inferiority' in him unless he stands on the steady feet of his discipline, is committed to intellectual osmosis, and constantly reminds himself of his goals and purposes. If he is an 'economic anthropologist', he judiciously and critically examines the propositions of economics to determine their suitability in understanding his data. He does not use his data to illuminate or support the economic theory. When his aims are lopsided, his encounter with economics will become 'awkward' rather than fruitful, and he will suffer from 'nervous inferiority' in relation to the economist, rather than becoming a 'coparcener' in the production of alternative perspectives on society.

All this boils down to our own conception of anthropology. If a study of what different anthropologists mean by the subject is conducted, we shall come across highly divergent opinions. For many, anthropology *will be* what they *do*: the practice will define the subject and not the other way round. Some will subscribe to the encyclopaedic notion: there is anthropology in everything and everything can be studied anthropologically. Rarely do we ask: What is 'anthropological' in what I do?

V

Problems for an anthropologist's work 'can be found everywhere human beings are in communication' [Firth 1992:211], wherever groups are formed and sustained. The anthropologist's laboratory is the entire mankind; the way in which people structure the reality around them, is what he studies. The human universes are not 'museumified' entities, static, neatly-kept and catalogued. They are perpetually changing. Those orders (and institutions) which men themselves proudly created at one time are rejected by them at another time. Taxonomies are challenged; the catalogues need to be constantly updated. Human beings have tremendous capacity to perfect themselves. This process is however punctuated with crises – with contradictions and conflicts. Change is ceaselessly occurring; it is imperceptible and needs to be constructed. Geertz (1995:4) writes: 'Change, apparently, is not a parade that can be watched as it passes.'

The anthropologist did (and does) many things with societies and cultures. In the formative era, he studied the origin of institutions, customs, groups and collectivities, and the stages through which they were believed to have passed. Then, he compiled the detailed accounts of the past of these societies by focusing on the 'memory culture' of his respondents. How social institutions had diffused from the centre of their origin, or from one society to another, greatly interested him. In the wake of the repudiation of earlier pseudo-historical approaches and psychological reductionism, and the aimless documentation of cultural traits, came the much celebrated functional approach. With this, anthropology became a synchronic study, of 'here and now'. The criticism of functionalism revived many earlier approaches. The French became interested in the working of the human mind and unravelling its underlying structure. Their contemporaries in America, those who became popular as cognitive anthropologists, intended to study culture by getting into the heads of its bearers. Some French and American scholars applied the Marxian approach to the superstructure of society. Network analysis, transactionalism, modern variants of structuralism, feminism, reflexivity, interpretivism, have been other corrective alternatives.

The aforementioned approaches and their several kindred variations, known by different technical names, barring those which were conjectural, co-exist in contemporary anthropology. But, the most rallying is around the one which is concerned with meaning. Some of its advocates derive their intellectual authority from Weberian sociology and its further development in the hermeneutical tradition. In a nutshell, the contemporary anthropologists do the following. They conduct a lengthy fieldwork with a 'community' of people, far-away or nearer home.[20] During the course of study, they are 'hued' by the 'object' of study.[21] From this experience is born the ethnography.

Anthropology is a 'sceptical study' [Firth 1992:210]. It does not take anything for granted. Whether acknowledged or not, we begin with the Durkheimian rule: 'I do not know a social fact unless I have studied it' [Durkheim 1938]. Our aim is to understand the plexus of meanings people attribute to their thoughts and action. Alongside, we unravel those meanings and interconnections of institutions of which their creators may be unaware. We keep a distinction between the perspectives and analyses of the actor and the observer.

The anthropologist is an empiricist ('world-observer'), an interpreter ('world-describer'), a comparativist ('world-comparer'), and a futurist ('world-imaginer'), whose cosmic ambition is to know about the human society as a whole.[22] His aim is pre-eminently academic: to interpret and explain. It is not to delve in the charters of policy prescriptions.[23] Today, especially in India, many anthropologists are solely concerned with the issues of policy, churning out the agendas of action. Perhaps they feel that in this market-oriented world they have to be utilitarian. They try to prove their Darwinian fitness in the academic world as well as in the market-society by formulating hypothetical programmes for the betterment of human beings. Their comments on policies, lists of pleas, designs of action, scarcely rise above the commonplace.[24]

None of the scholars concerned with the future of anthropology has argued against action anthropology, putting knowledge

to real and concrete use.[25] Giddens (1996:126) writes: "Anthropology must be ready to contest unjust systems of domination, along the way seeking to decide what 'injustice' actually is, and be prepared to bring potentially controversial issues to light". For Hart (1990:14): "Anthropology is 'for' making a better, more democratic world for everyone". To achieve this, we should be 'politically' and 'morally' engaged with social problems. Our vision of future is of greater freedom and equality of human beings, both as a right and policy, and anthropology must work towards their achievement. Inspiration for applied work, Hart thinks, could be drawn from Leach's lectures published as *A Runaway World*? where he argued that anthropology could be used for resolving crises of the contemporary world. He also suggested that we should try to spread the anthropological vision amongst the mass audience.

Sponsel (1990) argues for greater involvement of anthropologists with the people they study. Grimshaw and Hart (1993:44) say that the 'resolution to anthropology's dilemma' requires new 'patterns of social engagement'. For Ingold (1994:xviii), anthropology is a 'science of engagement'. The 'subjects' of our research are not 'objects'; they are fellow beings. One of our duties is to take overt action to defend human rights. Cultural relativism is simply a 'frame of mind', a methodological tool. It does not imply, or should not be confused with, ethical relativism. The topic of universal human values and basic needs has become central to contemporary anthropology [Hatch 1983; Scupin and DeCorse 1995]. None should starve, none should be inflicted with physical or psychic torture, none should be stripped of basic human rights and needs, are some examples of universal values. The anthropologist should render his firm commitment to them in academic as well as practical terms. Firth's summary expresses it well: "[The] anthropologists must have a social awareness, a social conscience, some degree of commitment to the people among whom they work. Locally, an anthropologist can sometimes defend the peoples' interests against bureaucratic ignorance, the rapacity of salesmen or the arrogance of developers" [Firth 1992: 219]. The role of anthropology in exposing various myths which perpetrate inequality in society is well acclaimed. And, famously known is its contribution in planning and executing development.

The applied role will definitely condition anthropology's future, but the list of suggestions, policy prescriptions, must entail from a rigorously conducted study in which the focus is on understanding. Theoretical and applied researches are two sides of the same coin: 'knowledge for practice' and 'practice for knowledge' are intimately connected [Srivastava 1990: 316]. Before peoples' interests are defended, we should acquire a thorough knowledge of the conditions which breed rapacious salespersons or arrogant developers. Understanding and interpretation are placed before action, advocacy, and activism. A good anthropology is one which yields sound, detailed, and convincing knowledge of a society; and from this follows a culturally-rooted, endogenous, and holistic plan of development.

The social responsibility of the anthropologist has increased manifold presently. It is bound to enlarge further. Anthropology began in the mid-19th century as the evolutionary study of the entire human society. As it grew in time and space, especially with the addition of ethnology sections in museums, it progressively became a mode of producing knowledge of the 'exotic other', the 'primitive society'. By the time the term 'social anthropology' was invented for the Liverpool Chair founded in 1908 for James Frazer, the 'intellectual object' of anthropology – the savage, the pre-literate, the simple, the non-western – had been fully found. Gough (1968:403) writes: 'most of our fieldwork was carried out in societies that had been conquered by our own government'. The we-they distinction, or the distinction of the self and the other, was the pith of the anthropological work: '...anthropological knowledge came to be a map of difference, of alterity' [Das 1995:3]. That the 'they' was qualitatively different from the 'we' constituted the discourse. Anthropologists wrote what they thought was right, proper, and just, on and about the primitives, who were mute, who did not answer back [Giddens 1996: 121-2; Geertz 1998: 72]. The monographs thus produced were for the literate, white, western public.

Overtime, as a result of culture contact with modern societies, the primitives have been de-primitivised. No more are they 'they' in pristine terms, but are gradually assimilated with the 'we' [Geertz 1998]. As globalisation progresses apace, the difference between the 'we' and the 'they' narrows down tremendously. The erstwhile primitives now read and write; question the inquisitive ethnographer on the purpose of his study and wish to share the results of his enquiries; read monographs to discover their past moorings and also detect grave errors made by the anthropologist in understanding their culture. The staunchest critics of ethnographic writings on a society are now its 'literate' people. They answer back and interrogate their ethnographers.[26] The latter has to be cautious about the veracity of ethnographic details he collects. Furthermore, the 'natives' now study their own societies where they enmesh their experiences of being a native with an objective project. Native anthropology, or autoethnography, as it is designated, brings with it its own commitments and values [Srivastava 1995b]. Anthropology is now produced in a different set of social conditions. It has to be far more reflective and humanistic.

This changed scenario does not suggest that we become 'subjective' in our approach. Rather, we have to combine the requirements of a dispassionate study with an unflinching commitment to universal human values and rights. Our methodology adheres to the principle of objectivity, whilst our 'practical anthropology' (to borrow Malinowski's term) does not compromise on the agenda of human welfare; it is value-loaded.[27] It is wrong to assume that if we 'side' with particular arguments regarding human condition, then we tend to lose our objectivity. To recall Cresswell (1968:411-2): 'A physicist can fulfil his sense of social responsibility by speaking out, for instance, against the use that politicians and the military make of the atom bomb he has made possible, without affecting the laws describing the behaviour of atoms and molecules'. In a similar way, we endeavour to understand human society as objectively as possible, but speak out against all those social contexts where human rights are abrogated, where values of equality are suppressed, where injustice prevails.

The people whom we study, wherever they live, are no longer hidden, forgotten, lost, or cloistered.[28] No more is the tribal society 'isolated', a 'complete society', an 'anthropological whole'. Not only the national but also the international economic systems affect the micro-societies. The genesis of rural poverty can be traced to the unjust social and economic system of the international order. Ethnicity has become a transnational phenomenon. The future anthropologists will need to study the socio-cultural aspects of international relations [Foster 1984; Wright 1988; Messer 1993; Cole 1995; Srivastava 1995a]. Impact of the fast-changing technology, global consumption patterns (overconsumption of a few co-existing with the underconsumption of many), shifting geo-political configurations, and new forms (and strategies) of domination

on human communities all over the world, are the areas of priority. The relation of the local with the global will be central to future anthropology [Moore 1996].

Although defined as the study of the entire human society, anthropology has predominantly dealt with tribals and peasants. Its emphasis in urban studies has been on slums and squatters, shanty satellite towns and migrants, religious communities, and lower-class neighbourhoods. It has not so far conducted detailed field-based studies of elite societies, of people who 'answer back' and reflect on the methods used and conclusions reached. The effect of functionalism, or any other method which searched for fixed categories, has been so overwhelming that we did not contribute much to the understanding of social turbulence. For the future survival of anthropology, it is imperative that we study societies in distress, in hunger, in collective pain and war [Das 1995; Nordstrom and Robben 1995]. We should apply anthropological knowledge to understand social issues and apprise the lay public in a de-jargonised language with our findings and suggestions for improvement. I may refer here to Bhattacharya's recent researches (1998) on the history of hunger and starvation. The lesson we learn is that no more is anthropology esoteric, the 'engagement of colonial masters' or the 'sport of kings'.[29]

VI

We have tremendous faith in the analytical ability of anthropology. Even other disciplines have been considerably influenced by anthropological perspectives. The future of our discipline is incumbent upon a better understanding of human society and culture, because from this will logically follow the steps to be undertaken for ameliorating human condition. Whether we are physical or social anthropologists, we view a system (biological, social, or cultural) in a state of dynamic equilibrium. We consider a number of factors – intrinsic and extraneous – which condition the working of systems. Biological and cultural factors should be seen as complementary, in a state of 'heuristic synergism' [Srivastava 1990: 314]. If we erroneously believe that one fact is 'superior' to the other, or is hermetically sealed, then we are likely to fission the discipline as well the 'tribe' of anthropologists (to borrow the popular words of Max Gluckman). We hear of incessant conflicts between physical and social anthropologists over the allocation of resources, and teaching and research positions in a department. These cleavages reflect the orientations these 'sub-tribes' of anthropology have towards the two great anthropological constructions – the biology and the culture. Some physical anthropologists think that their accomplishments are true to the scientific tradition, whereas their counterparts in social anthropology are simply raconteur, not more than story-tellers. The social anthropologists may regard their work as more important, by claiming that their work begins where science ends. Instead, if we begin with a model of complementariness between different facts that concern us, the tenor of our research will be qualitatively different. We can learn a lot about it from the actual practice of medical anthropologists. The future of anthropology lies in such studies.

Anthropology is principally a field science. This is not to say that anthropologists have depended upon fieldwork for their ideas, but have always referred to the field for a critical scrutiny of their theories and ideas [Fox 1975]. Unfortunately, the quality of fieldworks, especially in Indian anthropology, has become poorer. Our students prefer to study their own societies rather than venturing into ethnographic landscapes where they struggle to learn a new language and pass through the non-assuaging pangs of loneliness. Since they study their own society, they start with the assumption that they know enough, thus overlooking the nuances, the finer points, the underlying currents, the subterranean elements, and the subtleties. It is here that they commit the error.[30] Needless to say, a good anthropology depends a great deal upon the quality of our fieldworks.

To sum up: a future *of* and *for* anthropology lies in constantly struggling to evolve a sophisticated theoretical and methodological apparatus, conducting solid fieldworks, and unswervingly subscribing to the premises of human rights, democratisation, welfare, and the development of people of all shades of life.

Notes

1 Four addresses were delivered on the futures of physical anthropology, archaeology, social anthropology, and material culture, respectively by G M Morant, V Gordon Childe, Raymond Firth, and R U Sayce. See *Man*, 1944, vol XLIV: 16-24.

2 However, I refer to a piece on the future of British sociology in Payne et al (1981).

3 In these words, Fischer (1986) has paraphrased Jean-Francois Lyotard's concept of the 'post-modern'.

4 For the last few years, I have been collecting data on this topic. At the close of the teaching session (generally mid-March), I make my students write in whichever language (Hindi or English) they have adeptness a short essay on the impact of anthropology on their personal lives and orientations. I have read these essays, but so far have not analysed them properly. The observation I make here is based on these write-ups. The students have invariably noted that they became less prejudicial after studying anthropology. In this context I remember Firth, 'Ignorance and prejudice about other peoples, particularly peoples of a different colour, is still widespread, and it is part of our [anthropologists'] job to try and break it down' [Firth 1944: 22].

5 Before 1995, anthropology was one of the most popular options for the Indian civil services examination. Its popularity declined after its syllabi in both the papers was frighteningly increased. Many topics were included on which good reading material did not exist. My comments on the revised syllabi appeared in Hindi in *Pratiyogita Samrat*, January 1996, 4(12):53-4.

6 This observation is not only based on Indian experience. Many western writers have pointed this out. Mayer (1981:vii) noted that when Furer-Haimendorf decided to read anthropology, it was an 'unconventional choice'. A Delhi anthropologist, Abhimanyu Sharma, was reported (in *The Hindustan Times*, June 26, 1976) to have said that the 'rejected lot' of students joined anthropology. I rebutted his observation (*The Hindustan Times*, July 2, 1976). The drop-out rate of students in anthropology department is quite high; these students leave anthropology to seek admission in other coveted courses. The heads of anthropology departments all over the world are engaged in increasing the popularity of the subject amongst the wider public. See MacClancy and McDonaugh (1996).

7 These six Delhi anthropologists were Surinder Nath, V C Channa, S L Malik, Anil Mahajan, Lalit Kumar, and myself. Today, four of them are teaching in the Delhi department of anthropology. The other two are employed elsewhere but do the anthropological work. Later, P C Joshi, N K Chaddha, and M P Sachdeva were also inducted in the editorial board of *SAP*. Chaddha is a psychologist but is reputed for many works on psychological anthropology. *SAP* continued its uninterrupted publication till 1991; then its publication was suspended following financial problems.

8 Because of his lengthy stay (often not less than a year or so) with a community, the social anthropologist develops almost quasi-permanent relations with its members. In many cases, he 'adopts' the community of people forever. Empathy, therefore, is an important element of the relationship between the observer and the observed. This is, however, absent in a physical anthropological work which treats its 'subjects' of study as mere 'objects'. In my opinion, physical anthropologists and archaeologists do not conduct the 'fieldwork' as social anthropologists define this term. Physical anthropologists may collect data from the field or laboratory situation. Archaeologists conduct excavations on sites likely to yield an industry of human artifacts. See Wolcott (1995) for the notion of fieldwork.

9 By 'hard-core' anthropologists, I mean those who have undergone a professional training in anthropology. They are not 'self-taught'

anthropologists. Today, sociologists write articles and books which bear the word 'anthropology' in their titles. 'Anthropology' has become a sort of 'discourse' in these writings rather than just remaining a discipline. Refer to works by Das (1995), Thapan (1998).

10 Leslie White (1943) submitted that all sciences dealt with energy and motion. Culture and civilisation were also forms of energy; the sciences were therefore unified methodologically. The organismic theorists developed the concept of society by comparing it systematically with that of the organism about which they knew well, courtesy the growth of biology. Organic analogy was a procedure to know the unknown ('society') with the help of the known ('organism'). See Harris (1968).

11 Well known are their conclusions of the status of social anthropology. For Radcliffe-Brown (1952), it was a branch of 'comparative sociology', another name of sociology according to Emile Durkheim. And, it was a kind of historiography for Evans-Pritchard (1951).

12 In his reply to Forde's question regarding the integration of anthropology's branches, Firth (1944:22) said that the four branches (physical anthropology, archaeology, social anthropology, and material culture) 'called for entirely separate disciplines, and that the ties of social anthropology were with sociology, rather than with physical anthropology or archaeology'.

13 Anthropologists are seen as those 'dilettantes who flit from one area to the next' [Kleinman and Copp 1993:6]

14 I have often heard of a suggestion that physical anthropology should be placed along with zoology, archaeology with ancient history, and social anthropology with sociology; and departments of anthropology should be done away with.

15 For instance, see Clifford (1986) and his joint venture, *Writing Culture* He writes that 'man' has disintegrated as *telos* for a whole discipline (p 4)

16 Ingold writes: "...anthropology, as it exists today, is not a single field, but is rather a somewhat contingent and unstable amalgam of subfields, each encumbered with its own history, theoretical agenda and methodological preoccupations" [Ingold 1994: xiv] Also see, Moore, (1986.1): "Anthropology is no longer a singular discipline, if it ever was, but rather a multiplicity of practices engaged in a wide variety of social contexts".

17 In a recent paper, Sillitoe (1998.224) notes that agricultural economists, human geographers, and plant pathologists are 'stealing our ['anthropologists'] disciplinary clothes They themselves conduct the anthropological work required for their study If I may add, the quality of their anthropological work is inferior which brings bad name to the subject.

18 In his keynote presentation at a seminar (on 'Anthropology in India: Problems and Prospects') in department of anthropology, Punjab University, Chandigarh, from March 6-9, 1986, Indera P Singh presented a long list of anthropological specialisations. An idea of special anthropologies can be gathered from the list of seminar topics prepared for the Xth International Congress of Anthropological and Ethnological Sciences (see *Indian Anthropologist*, vol 7, no 1, 1977, pp 68-70).

19 Here, we may refer to the following observation from Needham: "The more the anthropologist specialises the more he will be obliged to observe the standard of the discipline that he enters; and if he is to induce the practitioners of that discipline to take serious notice of his knowledge and understanding of ethnographic evidence, he must in his own work earn their professional respect by conforming to the scientific or scholarly criteria which they acknowledge" [Needham 1970: 40].

20 Besides the conventional areas, the 'community' could be of laboratory scientists, homosexuals, psychiatric clients, drug addicts, sex workers, professionals and politicians, etc. Anthropologists have worked on the impact of the new reproductive technology on kinship, family, and gender [Strathern 1990] and on the ethnography of the immune system [Martin 1996]. The 'field' of research is not given; it has to be constructed. Geertz (1995:106) remarks: '...research sites are not found, they are made'.

21 Geertz (1995:210) describes this in the following words: "You don't exactly penetrate another culture, as the masculinist image would have it. You put yourself in its way and it bodies forth and enmeshes you".

22 Anthropology is as much about 'us' as it about 'them' – the 'other' culture [Leach 1982].

23 Giddens writes, 'The practical connotations of anthropology are likely to depend upon a rekindling of the anthropological imagination than upon a narrowing-down of the subject to limited social policy issues' [Giddens 1996: 125]

24 See for instance, Samal ed (1996), a book of six hundred pages.

25 This however is not the opinion of many other anthropologists: see Leach (1982), Beteille (1993). Hugh-Jones writes about Leach, '...throughout his [Leach] life he remained deeply suspicious of the supposed benefits of applied anthropology' [Hugh-Jones 1989. 14]

26 There are many cases where the people are aware of the fact that they were studied anthropologically For instance, Pul Eliya, the Sri Lankan village which Leach studied, had a notice at its entrance placed many years after Leach had done his fieldwork there. It read: 'This is the village of the famous anthropological study' [Hugh-Jones 1989:21].

27 Some anthropologists believe that ethnography is not a fact but only personal opinion, a view which Firth termed 'egoistic or solipsistic anthropology' (1992: 219) For Leach (1987) as well as Hugh-Jones (1989:34), ethnography was fiction; for Geertz (1988) it was a 'literary enterprise'. But this is not the opinion which will help the future social anthropology

28 But many coffee-table books on tribes may carry these words in their titles, or descriptions of people, in order to increase their sale. See, for instance, a French publication on Indian tribes titled *L'Inde des Tribus Oubliees* (Chene, Paris, 1993). Perhaps the publishers are motivated by the idea that the 'exotic' sells, the 'familiar' does not.

29 I have borrowed the last phrase from Godfrey Lienhardt. Lewis writes: "When Prince Charles began his anthropological study at Cambridge, Godfrey Lienhardt (at an RAI council meeting) quipped that 'anthropology had become the sport of kings' " [Lewis 1998: 567]

30 It is relevant to remember here Beteille's observation. He writes: "I have seen many young British and American anthropologists return physically exhausted from the field, looking lean and hungry, like Cassius in the play. My Indian students show less wear and tear during their movements in and out of the field. Indian research scholars stretch field work out longer, doing it in several short spells, but rarely spend as much time in the field as their counterparts from overseas. They also rarely choose to do field work in a region other than the one to which they belong, this enables them to dispense with the trouble of learning a new language, and it allows them to take other shortcuts that in the end detract from the quality of their field work" (1996:234)

Mahakali Impasse and Indo-Nepal Water Conflict

Dipak Gyawali
Ajaya Dixit

The Mahakali Treaty between India and Nepal was signed and rammed through the Nepali parliament in extreme haste, pushing aside all the serious doubts that were raised about the dam, the highest rockfill dam in the world in the seismic Himalayas. This article attempts to put into perspective the complex set of events that led to the signing of the treaty and to understand the dynamics of Nepal-India water conflict in the last three years.

ON January 29, 1996 in Kathmandu, after about three days of deliberations, India's external affairs minister Pranab Mukherjee and Nepal's foreign minister Prakash Chandra Lohani initialled the Mahakali Treaty – known formally as the *Treaty between his Majesty's Government of Nepal and the Government of India Concerning the Integrated Development of the Mahakali River Including Sarda Barrage, Tanakpur Barrage and Pancheshwar Project.* Immediately, there was an unseemly scramble among Nepali politicians to take credit for the Treaty. From the former speaker of parliament to the general secretary of the Nepal Communist Party (United Marxist-Leninists) then in opposition, from hard-line panchayati politicos of yesteryears to hardboiled bureaucrats, all claimed a share in the glory or sang hosannas.[1] Today, except for those whose names have been directly enmeshed with the Treaty, one is hard pressed to find a champion who would risk defending Mahakali heart and soul.

There is a need to analyse this predicament because it holds deep lessons for future efforts in collaborative water management in the Ganga basin as well as development in general. The Mahakali impasse has roots deep in Nepal's history, and ramifications beyond water resources into political economy, diplomatic relations between India and Nepal as well as governance in south Asia. While the complex events surrounding it do need much deeper socio-political analyses than is possible here and in so close a time period after the events, a beginning needs to be made that can serve as a prelude to future studies from a variety of other viewpoints. The purpose of this paper is to put into perspective the complex set of events that led to the signing of the Mahakali Treaty, and the impasse it has since been enmeshed in. It first presents the chronology of events leading up to the Mahakali impasse. With this overview, it then asks some open-ended questions that may uncover a rich agenda for further research. Several undercurrents emerge with this historical overview that need not just further insightful analyses but also some redeeming statesmanship, both in Nepal and India.

I
Chronology of Events

Early Years

The Sugauli Treaty of 1816 AD defined the national frontiers of present day Nepal. It forced the Gorkhali Empire, which had extended up to the Satluj in the west, to give up the conquered lands west of Mahakali (called Sarda in India), and fixed this river as the western boundary between Nepal and British India.[2] Given the remoteness of the headwater reaches where the arms of the Nepali state had only a feeble presence, not much is heard of conflicts in this area. In the southern reaches, however, where the land was gifted back by the British to Nepal in recognition of the services provided by Shogun Jung Bahadur Rana in suppressing the Sepoy Mutiny of 1857 AD, the braided nature of the river as it debouches onto the plains presented problems. Neither the thalweg nor centre line principle could be satisfactorily used to define the boundary, and it was taken as the mid-stream of the river with reference pillars on either side. Because of the shifting nature of the river course, a realignment of the boundary was ordered by the British India government in 1909 AD. After much correspondence and many meetings, the demarcations were completed in February 1912 during the Shogunate of Rana Chandra Sumshere.[3]

Soon thereafter, the British India government contemplated building the Sarda barrage to provide irrigation to western United Provinces. After a series of negotiations, it managed to realise a Sarda Treaty in 1920 which transferred 4,000 acres of the eastern banks of the Mahakali to India to build the Sarda barrage in exchange for 4,000 acres of forested land in areas to the east as well as Rs 50,000 to Nepal. Furthermore, the Treaty allowed Nepal to withdraw 4.25 cumecs of water in the dry season and 13 cumecs in the wet season, which could be increased to 28.34 cumecs if water were available. What India could withdraw out of the approximately 650 cumecs average annual flow of the Mahakali was, however, not specified. In effect, it was limited only by the scale of the technology it was free to employ.[4] This left room for critics of the 1920 Agreement to call it an 'unequal treaty' and, with perfect economic and technological hindsight of today, to fault Chandra Sumshere for undervaluing the left bank of Sarda barrage. There were also questions raised about where the 4,000 acres of land received in exchange from the British were located.

After a major flood in the Mahakali 'circa' 1953, India extended the left afflux bund of the Sarda barrage about a 100 m into Nepali territory beyond the border pillar BP 6A between 1954 and 1958. This extension of the Sarda afflux bund is physically similar to the case in Tanakpur in 1991. However, it is not known publicly if Nepal government provided permission for this in any form. If it was an incursion, there is no record of any protest over this by any Nepali government then or afterwards – neither during the panchayat years nor even while the Tanakpur debate raged on after the restoration of democracy during the first half of the 1990s.[5]

During the 1950s, there were no major initiatives on the Mahakali, but major flood control embankment building and irrigation projects were undertaken in north Bihar and Uttar Pradesh plains by the Indian government. To further these initiatives for the north Ganga plains, India entered into two major river treaties with Nepal in this period: the Kosi agreement on April 25, 1954 (revised subsequently on December 19, 1966) and the Gandak agreement on December 4, 1959 (amended on April 30, 1964). These treaties, and the projects they gave birth to, have had their own less than salubrious impact on Nepali polity and popular perceptions of Indo-Nepal water relations, the details of which are beyond the scope of this article.

Panchayat Raj (1961-April 1990)

Nepal, with a loan from the World Bank, began the Mahakali Irrigation Project in 1971 to utilise its share of the waters of the Mahakali as allowed under the Sarda agreement of 1920. By the second decade of Panchayat rule, Nepal's water resources development activities had began to acquire a donor-led, statist bias, precluding other (private or community-based) institutional possibilities. Private initiatives in power generation were discouraged by HMG's new industrial policy of 1972 that nationalised electricity production to make bilateral and multilateral donor involvement easier.[6] There was extensive World Bank, UN, ADB, USAID, etc, involvement in irrigation, power and water supply projects. The ministry of water resources, with irrigation, flood control, electric power, and water supply within its brief, became the largest infrastructure ministry in the country overtaking the ministry of works and transport. With the exception of the 21 MW Trisuli and 14 MW Devighat hydroelectric projects, there was not much inclination for furthering water resources projects that would be mutually beneficial to both India and Nepal.

Heavy investments were made in irrigation and power projects during this period – 66,000 ha Sunsari-Morang on the Kosi (1965-ongoing), 34,000 ha Narayani (1967-ongoing), 7,000 ha Kankai (1970-90), 25,000 ha Kamala (1975-85), 10,400 ha Chitwan Lift (1973-88), 36,000 ha Bagmati (1980-ongoing), (60 MW Kulekhani I (1974-80) and 32 MW Kulekhani II (1977-87) and 69 MW Marsyangdi (1982-89), etc. From 1985 onwards, the ministry of water resources was preoccupied with the 402 MW Arun3 (later scaled down to 201 MW, and finally abandoned in August 1995 after the World Bank pulled out of it because of criticism for its excessive cost that was four to five times more than that of private sector projects in the Himalayan region).[7] The significance of Arun3 to Tanakpur and Mahakali episodes is that this project, which had overtaken the entire water and power establishment in Nepal, saw every other alternative to Arun3 such as Sapta Gandaki, Burhi Gandaki, West Seti, etc, as rivals to be suppressed or sidelined rather than examined with an open mind. As a result, during the Panchayat rule, Nepal's water establishment was never able to approach India openly, question its plans and propose a co-operative alternative that was better suited to Nepal's interests.

In 1983, India completed the technical study of a 120 MW hydroelectric project on the border river Mahakali near the town of Tanakpur in Nainital district. Nepal raised its concerns with India regarding possible damage to Nepali land and territory, including the Mahakali Irrigation Project. The 120 MW Tanakpur power plant, which uses all the waters of the Mahakali during the dry season, would have emptied its tailwater into the Sarda canal feeding the UP system and not into the river upstream of the intake of the Sarada barrage from which Nepal's Mahakali Irrigation Project receives its water. India agreed to redesign its project and release the Mahakali water back into the river so that Nepal's existing irrigation project would not be left high and dry. It also agreed to, and constructed, some river abutments to ameliorate bank cutting on the Nepali side.[8]

By 1988, India had completed the construction of the Tanakpur barrage and the powerhouse with the exception of the left afflux bund that was needed to tie the barrage to the high ground on the left bank in Nepal. Despite its earlier insistence that this was a wholly Indian project in fully Indian territory and thus of no concern to Nepal, it became necessary for India to request for 577m of Nepali land for this purpose. However, around this period, relations between Nepal and India deteriorated with Nepal importing Chinese light arms and India imposing a peacetime economic blockade of Nepal in March 1989. The matter of extending the left afflux bund was not pursued further in view of other pressing concerns, but the essential strategic thrust of Indian government *vis-a-vis* Nepal's water resources made itself felt in its diplomatic proposals.

In November 1989, with the main architect of the blockade Rajiv Gandhi not faring well in the Indian parliamentary elections, the foreign ministers of the two countries were able to meet in New Delhi in January 1990. Even as the anti-Panchayat agitation led by the Nepali Congress and the United Left Front continued in the country, the royal regime toned down both its promotion of 'Nepal as a Zone of Peace' concept and its opposition to the 1950 Treaty of Peace and Friendship with India, and agreed to India preparing a new draft agreement on mutual co-operation. In a bid to extract maximum benefit out of the political turmoil in Nepal, India put forth a draft proposal on March 31, 1990 that included more stringent demands on Nepal *vis-a-vis* Indian security concerns than the 1950 Treaty. It was reminiscent of what one scholar has described as the 'Krishna Menon syndrome'.[9] It included Article III of Part VI Economic, Industrial and Water Resources Co-operation that stated:

> The two Contracting Parties being equally desirous of attending complete and satisfactory utilisation of the waters of the commonly shared rivers, undertake to (i) plan new uses or projects subject to the protection of the existing uses on the rivers and (ii) co-operate with each other to formulate and modify the planned new uses or project taking into consideration the water requirement of the parties.

The phrase 'commonly shared rivers' was to make a comeback later during K P Bhattarai's interim government, and the prior rights issue expressed as 'existing uses on the rivers' was to be resurrected in the 'package deal' on the Mahakali with the UML government.

On April 9, 1990, King Birendra lifted the ban on agitating political parties and multi-party democracy was restored in Nepal. The post-panchayat interim government was under pressure from the Indian government to allow the construction of the left afflux bund of Tanakpur barrage, especially after the economic blockade was relaxed following the restoration of democracy in April 1990. Soon after becoming prime minister of the interim government consisting of Nepali Congress and the communist United Left Front, Krishna Prasad Bhattarai visited New Delhi on the invitation of Indian prime minister V P Singh with an entourage that included Sahana Pradhan, then chairperson of the United Left Front and a minister in the interim government. On June 10, 1990, a joint communique was issued at the conclusion of his visit that included the phrase 'common rivers' and the expediting of their development. It was to become an election issue in May 1991 as an alleged example of Nepali Congress's 'sell-out' to India.

With the restoration of status quo ante of the pre-blockade days following prime minister Bhattarai's successful visit to India, the diplomatic initiatives from Delhi for Nepal's acquiescence to building Tanakpur's left afflux bund inside Nepali territory began to gather momentum. Meanwhile, the issue of Tanakpur, which had been wrapped within bureaucratic secrecy, began to unfold slowly in the public arena. Because the interim government's primary agenda was to frame the new constitution and hold elections, the matter of Tanakpur's left afflux bund was not pursued with any alacrity, but it continued to have its effect on Nepal's body politic. The new constitution of Nepal, which was being drafted in the meanwhile, was promulgated on November 9, 1990. It

ncluded a constitutional provision in Article 126 that required any resource-sharing agreement to be ratified by a two-thirds majority in parliament if it was of 'pervasive, serious and long-term nature".

The interim government subsequently did try to find a way out of the difficulty brought about by India's unilateral decision to construct a barrage on a common border river. Because of the geometry of the land swapped in 1920, if India tied the afflux bund to the high ground in its territory, significant portion of Brahmadeo Mandi in Nepal would be submerged. There was a need to look for a variant which would cause the least submergence in Nepal, and water resources minister of the interim government Mahendra Narayan Nidhi asked his technical team, on December 28, 1990, to make a review of the Tanakpur problem. This team recommended, on February 22, 1991, the best variant that Nepal could agree to so as to meet Indian requests. The team also mentioned Nepal's needs for additional irrigation in Kanchanpur district as well as highway connection to the Mahakali barrage that functions as the only AA class bridge over the river in this area.

On April 15, 1991, the cabinet of the interim government – which included members of the communist United Left Front – authorised HMG's negotiating team to conduct discussions with India within certain parameters, including the least harmful afflux bund variant, provision of 1,000 cusecs of irrigation water and 'some electricity' in return for agreeing to provide India 577 m of Nepali land for building the left afflux bund of the Tanakpur barrage.[10] On May 17, 1991, Indian prime minister Chandra Shekhar wrote to his Nepali counterpart Krishna Prasad Bhattarai asking for Nepal's permission to build the afflux bund, especially since the monsoon would be soon approaching. (If a record flood occurred, it could – unless prevented by an afflux bund – outflank the barrage with devastating consequences.) Because general elections were going on in Nepal, the matter remained unattended.

Centrist Majority Government and After

Nepali Congress won a majority in the general election even though its interim prime minister Bhattarai lost to the general secretary of the UML, partly due to the 'common rivers' issue. The new Congress government was headed by Girija Prasad Koirala as prime minister. He replied to Indian prime minister Chandra Shekhar, on June 10, 1991, that the permission requested from the Bhattarai government regarding Tanakpur's left afflux bund could only be given after detailed study and an agreement between the two governments.

Prime minister Koirala visited India between December 5-10, 1991 at the invitation of India's prime minister Narasimha Rao. Possibly because inadequate homework was done as regards Tanakpur, a decision seems to have been made not to discuss the matter with India in Delhi. This is highlighted by the fact that neither the water resources minister, nor the secretary of water resources, nor any other water resources experts were included in the 72-member strong official delegation that accompanied the prime minister to New Delhi. However, despite a possibility of breakdown of talks, a last-minute set of agreements was entered into with the government of India, which included trade and transit and development issues, as well as plans to develop major high dams in the Nepal Himalaya.[11] Among other things, this December 1991 agreement, explained as a mere 'understanding' and not a treaty that would have to be presented before parliament, allowed India the use of 577 m of Nepali territory to complete the construction of the left afflux bund of the Tanakpur barrage. Nepal was to receive 'free of cost' 10 million units of electricity as well as 150 cusecs of water for irrigation.

On December 15, 1991 prime minister Koirala gave a public speech about his India visit at Kathmandu City Hall. In the interest of transparency, and to counter allegations of any 'secret treaty', he promised to make public the agreements via the official *Nepal Gazette*, which was subsequently done on December 24, 1991. The details of the 'understanding' that began to emerge after Koirala's return to Kathmandu raised a lot of suspicion and hackles. It allowed India to hastily start the construction of the left afflux bund by December 15, which is before details of the 'understanding' had been made public in Nepal. Construction of flood protection works was stated to start in November 1991 even before the 'understanding' was initialled in Delhi. The newspaper reports and gazetted notices continued to confuse 10 million units (KWh) of electricity with 10 MW of power, prompting a debate of what Nepal had actually received for allowing its left bank to be used for the project.

On December 17, 1991 advocate Bal Krishna Neupane filed a writ at Supreme Court challenging this 'understanding' and appealing to the court to have it declared a treaty requiring parliamentary ratification by a two-thirds majority as per Article 126(2) of Constitution of Nepal. On February 28, 1991, during the winter session of the parliament, the communist opposition gheraoed the rostrum of the lower house for eight hours and prevented parliamentary proceedings in a bid to force the government to table before the house all documents relating to the Tanakpur 'treaty'. The treasury bench, on the other hand, maintained that it was only an 'understanding' and everything relating to it had already been published in the *Nepal Gazette* of December 24, 1991. A 19-member all-party special committee of the parliament was formed to try and find a consensus. On March 11, 1991, prime minister Girija Prasad Koirala presented written reply to the Supreme Court defending his government's position. Street agitation against the treaty dominated national politics and newspapers for months. In end-July beginning August, prime minister Koirala attended the non-aligned summit meeting in Jakarta where he is understood to have met India's prime minister Narasimha Rao and discussed the Tanakpur imbroglio.[12]

The all-party special committee of the parliament held extensive meetings and invited external specialists as well as government experts to the hearings. It was, however, unable to reach a consensus as sharp divisions remained regarding the actions of the government and the interpretations of the constitutional provision. Instead of a single document, there were three different reports presented by the committee to the lower house of parliament on September 7, 1992. In a memorandum submitted to the chairman of the upper house dated September 9, 1992, eight communist factions (including the UML, Unity Centre, United and Masal) state that the Tanakpur 'understanding' signed by prime minister Koirala was a treaty which could only be implemented after ratification by a two-thirds majority in parliament. They demand to know from the government where the 4,000 acres of land swapped with British India in 1920 is located. The communists stated very clearly that it was wrong to link the Pancheshwar Project with Tanakpur. Pancheshwar high dam, they wrote, is a separate project requiring a separate treaty with parliamentary ratification, and there is no need for Nepal to compromise her future bargaining position at this stage.

In October 1992 India's prime minister Narasimha Rao visited Nepal during which the Tanakpur 'understanding' was renegotiated. The quantum of electricity

that Nepal was to receive from the project 'free of cost' was raised from 10 to 20 million units. Future upstream water developments such as Pancheshwar Multipurpose Projects were delinked from the agreement on Tanakpur with the provision that both countries were free to negotiate on upstream projects independent of whatsoever is agreed to at Tanakpur.

On December 15, 1992 the Supreme Court of Nepal decided that the Tanakpur agreement was indeed a treaty and not just an 'understanding', and that it would have to be presented to the parliament for ratification as per Article 126 of the Constitution of Nepal. The Court, however, failed to provide a ruling on the second point of the petitioner, which was to require parliamentary ratification by a two-thirds majority as per Clause (2) of Article 126. It left it upon the parliament to decide whether the ratification should be by a simple majority or, if the matter was deemed to be "pervasive, serious and long-term", to be ratified by a two-thirds majority.

A month after the Supreme Court decision, the government constituted a committee (Baral Commission) to evaluate the impact of the agreement. The committee fixed six criteria to define whether this river development initiative and the agreement associated with it constituted "all encompassing, serious and long-term" issues. They were:

(a) If a single treaty were done to regarding use of several different river basins of Nepal, the treaty should be considered "all encompassing, serious and long-term";
(b) If a treaty is made for an entire river basin, then the treaty should be considered "all encompassing, serious and long-term";
(c) Run-of-river hydroelectric projects (with no water storage) will be excluded from this definition;
(d) This definition would apply to storage projects of capacity greater than 1000 MW and capacity factor less than 0.3;
(e) This definition would also apply to projects whose costs would be large compared to economic indicators such as annual GDP, and where sovereign loans are involved which would have to be paid back not just by the current generation making the decision but by future generations or which would be difficult to pay given the state of the economy; and
(f) The definition would apply to projects with large reservoirs where resettlement is difficult to handle within Nepal's finance, land availability, etc.

Based on these criteria, the compensation that Nepal received for allowing India to use 577 m of Nepali land to complete the 120 MW run-of-river, the renegotiations that occurred during the visit to Kathmandu of Indian prime minister Narasimha Rao that delinked Tanakpur from future developments upstream at Pancheshwar, as well as other benefits that would accrue to Nepal from the barrage such as transport, irrigation as well as diplomatic goodwill, the Baral Commission concluded that the Tanakpur Agreement was of a simple nature and not an "all encompassing, serious and long-term" one.

Subsequent to this report and other consultative works, the government made a move to present the Tanakpur Treaty to the parliament. It is suspected that the government intended to present it as a treaty of a simple nature that needed ratification only by a simple majority. It is also not clear if the government had set forth any criteria, new or otherwise, for defining the nature of the treaty as such. A meeting of the parliamentary committee of the Nepali Congress had been called. The Nepali Congress supreme leader Ganesh Man Singh refused to attend the meeting and fired what is popularly known as a 'letter bomb' to the chairman of the Nepali Congress. In his epistle of March 8, 1992, the Congress supremo declared: "Passing the Tanakpur Treaty by a simple majority of the lower house of parliament would be the equivalent of signing a death warrant. My conscience prevents me from putting my signature to it. Please do not compel me to go against my conscience."[13]

His letter, just as the Supreme Court's decision, skirted the difficult but germane issue of defining the criteria for calling Tanakpur Treaty an "all encompassing, serious and long-term" matter. The Ganesh Man faction of the Nepali Congress had been clamouring for Koirala's resignation on moral grounds after the Supreme Court decision. The speaker of the parliament (who came from the Bhattarai faction of the Congress) had compromised his non-partisanship by declaring that the house belonged to the opposition and by not co-operating with the Koirala government in this matter.[14] Ganesh Man Singh's letter effectively derailed any political chance of the issue being resolved politically in parliament by any initiative from the Koirala camp. It was thus left hanging in limbo. Even the very first meeting of the newly formed high level National Water Resources Development Council – held on the eve of V C Shukla's visit to Nepal, chaired by the prime minister and including in its composition all important politicians and bureaucrats – did not discuss at all projects of controversy such as Tanakpur and Arun3.[15]

In December 1993 the Indian water resources minister V C Shukla visited Nepal and managed to extract from the Nepali government an 'action plan' on how to proceed with the implementation of the Tanakpur agreement even when the main treaty had not been approved by the parliament as was required by the

Supreme Court verdict of December 1992.[16]

Soon thereafter, the Nepali government – which was embroiled in the Arun3 controversy – granted a private Australian company a 'hunting licence' to build the approximately 750 MW west Seti hydroelectric storage project upstream of the Karnali Chisapani Dam site and to sell the electric power to India. The matter was not presented to parliament, no questions were asked about the benefits of regulated flow that would accrue to India, and no political party or figure showed any interest or need to raise the matter, even though this issue had implications regarding Article 126(2) of Nepal's Constitution. Another attractive scheme, the Sapta Gandaki run-of-river hydroelectric project, found the site of its powerhouse and desilting basin given away to a private medical college for setting up its campus. It was speculated that this was done to remove these projects from the list of contenders to Arun3.

Meanwhile, the special all-party committee of the parliament failed to make any headway. Because of strong personal animosities among political leaders of different parties, this special committee was also unable to define what constitutes "all encompassing, serious and long-term" water sharing issue as per Clause 126(2) of the Nepali Constitution. During the agitation against the Tanakpur 'understanding' by the Koirala government, his opponents from the opposition as well as from within his own party had hyped up the rhetoric to such an extent that an acceptable resolution of this impasse was well-neigh impossible. Committee discussions became a lacklustre buying of time and parties began to exhibit early signs of 'Tanakpur fatigue'.

In July 1994, the Koirala government fell when MP's of its own party boycotted the house and a bill elaborating his government's policy was voted down. The row over Tanakpur and the Supreme Court's verdict were considered among the significant factors that contributed to the brewing of this situation. Mid-term general elections were held in November 1994 which resulted in the Nepali Congress losing the majority it commanded in the outgoing house.

The communist UML, which had vociferously opposed the Tanakpur Agreement, emerged as the single largest party in a hung parliament and formed, on December 9, a minority government. In the heat of the debate, both the communist UML and the RPP had called for renegotiating the Tanakpur agreement. India saw no reason why it should live up to the hype of Nepali opposition leaders. To resolve the impasse, the UML government, ostensibly after receiving signals from India's CPM, put forth in April 1995 a 'package deal'. This plan proposed increasing the quantum of electricity and water to be made available to Nepal, but requires Nepal agreeing to the construction of a massive (315 m high, 6,480 MW) storage high dam at Pancheshwar in the mountains upstream of the Tanakpur site on the border Mahakali river. It was this very linkage of Tanakpur with Pancheshwar that the UML had opposed previously.

Pancheshwar was a dam that India had wanted all along for over two decades but for which Nepalis had not shown much interest because of their smaller requirements for water and power. There was also a lack of clarity from the Indian side regarding power purchase price as well as valuation of irrigation benefits and India's security concerns over control of the dam that would have compromised Nepal's sovereignty. Former prime minister Kirti Nidhi Bista had warned the powerful general secretary of the UML and deputy prime minister Madhav Kumar Nepal before the latter left for talks with New Delhi that he did not agree to the Indian demand on Mahakali. He said that he had turned down Indira Gandhi's request for a pact on the Mahakali in 1972.[17] The minority UML government, however, was not able to push it ahead because of differences within its ranks about the implications of the 'package deal'. Also, it soon got embroiled over the controversial Arun3 hydroelectric project from which the World Bank withdrew support in August 1995 during its tenure, allowing the Nepali Congress to blame it for 'setback to development'.

The minority UML government fell in September 1995 and a three-party coalition of the Nepali Congress, the RPP and the Sadbhawana Party formed a new government headed by Sher Bahadur Deuba. Because of the need to accommodate as many MPs as possible in a shaky coalition, Deuba formed the largest cabinet in the history of Nepal and also created a new ministry of science and technology. By now, 'Tanakpur fatigue' had overtaken all parties in small or great measure and Nepali politicians were too embroiled in infighting among parties and groups for perks and privileges to worry about long-term interests.

During November-December 1995, in what has subsequently come to be known as the Pajero scandal, the Deuba government allowed initially MPs and later senior bureaucrats and judges the favour of importing luxury vehicles duty free without disclosing their sources of income. It was seen as a violation of Article 67 of the Constitution as well as Facilities for Members and Officials of the Parliament Act 2052 that specifies what members are entitled to as perks and privileges. The said Act does not allow MPs the facility to import luxury vehicles duty free. Only a handful of MPs did not avail of this facility, and an even smaller number openly criticised the government's move, which was seen as institutionalising corruption and buying of parliamentary votes.

On January 26, 1996, just before the arrival of Indian foreign minister Pranab Mukherjee to Kathmandu, a meeting was called between two representatives each of three major parties – the Nepali Congress, the UML and the RPP – who put their signatures on what is called a 'National Consensus on the Use of the Waters of the Mahakali River".[18] This so-called 'consensus agreement' was done outside the parliament and its committees, including the All-Party Committee on Tanakpur; the smaller parties as well as opposing factions within parties were not represented and it basically furthered the earlier UML-proposed 'package deal' on the Mahakali.

On January 29, 1996 the foreign ministers of Nepal and India (Prakash Chandra Lohani and Pranab Mukherjee, respectively) signed the 'Treaty concerning the integrated development of the Mahakali river, including Sarda barrage, Tanakpur barrage and Pancheshwar project'. The treaty provides 50 million units of electricity to Nepal from the Tanakpur powerhouse and barrage over and above the 20 million agreed between Girija Koirala and Narasimha Rao. It also provides more water for irrigation as well as environmental needs below Sarda barrage but wrest from Nepal the consent to build the Pancheshwar high dam – which would generate nine billion units of electricity that would be consumed mostly by India. It also had some water and cost sharing provisions, which subsequently became controversial as their implications began to unfold. The agreement was clearly and without doubt of an "all encompassing, serious and long-term" nature and needed two-thirds ratification by parliament. However, it became clear that Nepal's rights to 50 per cent share of the water of a border river had again been compromised by Article 3 of the treaty as well as Clause 3 of the accompanying Lohani-Mukherjee exchange of letters.[19]

The prime ministers of Nepal and India re-initialled the treaty during the visit t

India of Nepali prime minister Sher Bahadur Deuba on February 12, 1996. A day later, on February 13, 1996, the Communist Party of Nepal (Maoist) led by Puspa Kamal Dahal (Comrade Prachanda) and the United Peoples' Front led by Baburam Bhattarai declared the Maoist 'peoples' war', an insurgency which has taken more lives than most past revolutions in Nepal. Among their many demands was, and is, the abrogation of the unequal treaty on the Mahakali.

On February 17, 1996 in Bombay, during a continuation of the Nepali prime minister's India visit, the Nepali secretary of the ministry of water resources and the Indian secretary of the ministry of power signed an umbrella 'agreement between His Majesty's government of Nepal and the government of India concerning the electric power trade'. This agreement allows any governmental, semi-governmental or private enterprise in Nepal or India to buy and sell power to each other determining, in the process, their terms and conditions. Meanwhile, public debate began to heat up prior to the parliamentary ratification of this treaty. This debate was very strong within the left and right parties. There was, however, practically no debate or discussions within the centrist Nepali Congress that had, since coming to power in 1991, jettisoned the principles of 'democratic socialism' in favour of economic liberalism.

Two weeks after the treaty was initialled on April 10, 1996, because of public pressure, the 26th Central Committee Meeting of the UML formed a working group to study the treaty and its implications, even though its Janakpur meeting welcomed the signing of the treaty. Meanwhile, on August 20, 1996, water resources minister Pashupati Sumsher Jung Bahadur Rana tabled the Mahakali Treaty for parliamentary discussion and ratification.

In what is widely seen as an effort to pressurise the UML into ratifying the Mahakali Treaty, the British minister of state for parliamentary affairs Liam Fox and the US assistant secretary of state for south Asia Robin Raphael hinted during their visits to Nepal around August 26, 1996 that non-ratification of the Mahakali Treaty would send a wrong signal driving away private international investments in Nepal.[20]

On September 2, UML's study committee on the Mahakali Treaty (Oli Commission) presented its report to the general secretary, which highlighted 26 flaws with the Treaty. Among the flaws reported (for the first time) was the presence of Indian troops at Kalapani in Nepal near the headwaters of the Mahakali.[21] In terms of seriousness regarding matters pertaining to Nepal-India relations, it subsequently overshadowed the Pancheshwar high dam issue. This report virtually split this main opposition party (without whose votes the Treaty would not muster the required two-thirds majority in parliament) into two – the majority Bolsheviks who felt that the Treaty should be ratified first and the negative points taken care of during the preparation of the engineering report (DPR) of the high dam project, and the minority Mensheviks who thought the Treaty should not be ratified until all the flaws had been cleared up with India (and who later split off as the ML faction).

The working committee and central committees met in almost continuous sessions to iron out the differences between the Bolsheviks and the Mensheviks. The 28th meeting of the central committee of the UML was held from September 4-9, 1996. This meeting decided that the Treaty can be ratified only after HMG and the government of India gives written commitments to rectify the following items:

- Demarcate Nepal's western border with India within a fixed time-frame.
- Remove Indian military checkpost from Darchula.
- Give to Nepal 36.67 acres of land that should have been given when the Sarda barrage was constructed.

- Declare Mahakali river as basically a border river.
- Have written commitment from India that it will buy Nepal's share of the electricity from Pancheshwar dam on the principle of avoided costs.
- Assure that Nepal will have half the rights to the water produced from Pancheshwar dam, that Nepal will have unhindered right to use her share of the her water, and that India will not raise any objections to Nepali irrigation projects in the Tarai.
- Review 1950 Treaty.
- Assure alternative transit point for Nepal through Bangladesh.
- Assure that the transit treaty between Nepal and India will be for long term
- Manage scientifically Nepal's border with India.
- Regulate Nepal-India border.
- Assure Indian help in solving the problem of the Bhutanese refugees.
- Assure that India will provide Nepal navigational access to the sea.

The UML wrote a letter to HMG asking for its and Indian government's written commitments on these points before it would consent to ratifying the Mahakali Treaty. On September 11 prime minister Deuba replied to the UML that all these issues are either covered in the Treaty or will be done by technical teams to be constituted between two governments. The Indian ambassador, in letters of September 10 and 19, declined to comment on these issues as diplomatically inappropriate to him; but he assured "that the government of India would be happy to discuss these and other relevant matters and reach mutually satisfactory understandings on them after ratification of the Treaty, at the time of finalising the detailed project report". The Bolsheviks are satisfied that this letter is enough of a written commitment on the above issues, whereas the Mensheviks call it a worthless receipt.[22]

At the penultimate moment before the parliamentary vote for ratification, an equally split 29-member central committee of the UML approved with 17 vote's majority against 16 votes to ratify the treaty. The chairman of the party, former prime minister Man Mohan Adhikari – who had spoken out against the Treaty – claimed indisposition, and he was replaced temporarily by an alternate member of the general secretary's choice who voted in favour of ratifying the Treaty. The party's Mensheviks called this a 'counterfeit majority'. Students ransacked the UML parliamentary party office and locked up leaders who had to be rescued by the police. There was an attempt by small parties opposed to the Treaty to encircle the parliament but police action, including arrest of some opposition politicians, including former prime minister Kirti Nidhi Bista, prevented this from happening.[23]

The Mahakali Treaty was ratified close to midnight by a more than two-thirds majority of the joint upper and lower houses of the Nepali parliament, as per the constitutional requirement of Article 126.[24] However, before the Treaty was ratified, the parliament unanimously passed a stricture on the Treaty ('sankalpa prastav') that is binding on the Nepali government. The stricture, *inter alia*, redefines water rights, especially as stated in Article 3 in the main Treaty text as well as in Clause 3 in the letter exchanged with the Treaty. The four elements of the stricture are:

(1) Nepal's electricity to be bought by India will be sold as per the 'avoided cost' principle;

(2) When the Mahakali Commission is constituted, it will be done only upon agreement with the main opposition party in parliament as well as parties recognised as national parties;

(3) 'Equal entitlement in the utilisation of the waters of the Mahakali river without prejudice to their respective existing consumptive uses of the Mahakali river' means equal rights to all the waters of the Mahakali; and

(4) Saying that 'Mahakali is a boundary river on major stretches between the two countries' is the same as saying it is 'basically a border river'.[25]

In the debate leading to the voting on the Treaty, UML parliamentarian Khadga Oli said that the Mahakali Treaty was done to correct the treason ('rastraghaat') committed in Tanakpur by the government of Girija Prasad Koirala. This allegation was not countered or challenged by the Nepali Congress, which en masse votes in favour of the Treaty, even though senior leaders such as Sailaja Acharya had voiced misgivings. The unanimous passage of this stricture essentially means that the Treaty has been given conditional ratification. The argument was put forward by those in favour of the ratification that the defects in the Treaty, as well as the provisions of the parliamentary strictures, would be taken care of during the preparation of the detailed project report (DPR) of the Pancheshwar high dam project. As per Article 3 (a) of the Lohani-Mukherjee exchange of letters with this Treaty (re-initialled again by Narasimha Rao and Sher Bahadur Deuba on February 12, 1996 in New Delhi) this DPR had to be prepared within six months of the entry into force of the Treaty, i e, March 19, 1997.[26]

Because of the controversy surrounding the Treaty, and the fact that it had been passed with an unanimous parliamentary stricture, the parliament constituted a joint parliamentary committee to monitor the Mahakali Treaty on October 10, 1996. Its objective was to guide the implementation of the Treaty and assure the inclusion of those points that have been missed in the Treaty such as the 'sankalpa prastav'. There were 10 members from different parties in the committee, which was chaired by the Speaker of the House of Representatives Ram Chandra Paudel.[27] Like the previous all-party parliamentary committee on Tanakpur, this committee too was unable to provide any guidance. The members visited the site and came back as confused as before. To add to their worries, India's joint secretary of water resources, responding to questions from Nepali journalists regarding the 'sankalpa prastav', said that India is not concerned with what such 'prastavs' say. Rather, India is only concerned with the wordings in the Treaty itself.[28] The much heralded statements by political leaders that all defects in the Treaty would be taken care of during the preparation of the DPR and that India has agreed to do so, is thus proved wrong.

Even as the two governments remained unable to prepare the DPR of the Pancheshwar project under the Mahakali Treaty, the Deuba government signed a memorandum of understanding with India to study the mammoth Kosi high dam project in January 7-9, 1997. This agreement, signed by Anand Bahadur Thapa, executive director of HMG/N Water and Energy Commission and Ramesh Chandra, chairman of the India's Central Water Commission, allowed the establishment of liaison offices in Nepal by India for the purpose of preparing these projects, committed Nepal to providing data to India on its water projects within this area from Birganj to Biratnagar within a month without India reciprocating along the same lines, and agreed to India paying for the perks and privileges of Nepal government employees on this exercise.[29]

Politicians of Nepal seem to have been guided by the view that large water resources projects are synonymous with Nepal's development. Nepali party functionaries fear political allegations that a project, any project, is not moving forward due to their action or inaction regardless of technical, economic or developmental demerits of such projects. Hence they prefer to be seen 'for' projects rather than questioning them. With the collapse of Arun3, Nepali politicians have

gone overboard blaming the opposition for its cancellation by the World Bank. To be seen as promoting water resources development the Deuba government continued its 'distress sale' type of approach to large-scale water resources development.

It proposed giving a 'hunting licence' to Enron Renewable Energy Corporation of Texas for the Karnali project. Enron highlighted in its proposal that it was willing to build the Arun3 as part of the Karnali-Arun3 package, with Arun3 costing only 700 million US dollars as opposed to the aborted World Bank/HMG plan which required 1.1 billion US dollars of which approximately 42 per cent was to be borne by the Nepali consumer through stiff tariff hikes. His cabinet minister for water resources Pashupati Rana opposed Deuba in this attempt because the matter involved downstream irrigation and flood control benefits that would accrue to India and upstream costs such as submergence to Nepal.[30]

In end February 1997, again because of party indiscipline, the centre-right Deuba government collapsed and an incongruous right-left coalition formed the government.

After the Treaty

Lokendra Bahadur Chand of the RPP become prime minister on March 3, 1997 after Sher Bahadur Deuba's government collapsed when some Nepali Congress MPs refused to show up during a crucial vote. Chand led a right-left coalition government of ex-panchas and the communist UML with Bam Dev Gautam as the deputy prime minister. This government exchanged the instruments of ratification of Mahakali Treaty with the Indian government on June 4, 1997 without including the provisions of the sankalpa prastav of the parliament. It also went ahead with an agreement with the private Australian Snowy Mountain Engineering Company regarding the export-oriented multipurpose west Seti storage project without discussing downstream water rights issues. The powerful deputy prime minister claimed in parliament that this was done because it is only a hydroelectric project and that "claiming downstream benefits from India may lead to India claiming damages from flooding from the waters released from the reservoir".[31]

The state of affairs of the body politic is highlighted by the following statement in *Kathmandu Post*:

> Ex- and soon-to-be prime minister Surya Bahadur Thapa's interview given to *Kathmandu Post*'s Akhilesh Upadhyay: *TKP*: What could be the interests of 'unseen forces' trying to destabilise democracy? *SBT*: The biggest destabilising force is the politics of commission. [Agents of] Arun3, Karnali, Enron etc. have come to play a crucial role in the frequent changes in government and the distribution of portfolios within a given government. For this class, its petty economic interests prevail over the national interests. This force has no scruples.[32]

The joint parliamentary monitoring committee came to an impasse. It directed the government to do a thorough homework regarding the source of the Mahakali and the status of the western border of Nepal.[33] After a long silence since the People's Movement in 1990 that overthrew the panchayat system, its last prime minister Marich Man Singh Shrestha broke his silence and gave an interview. He accused the government of caving in before India and claimed that his government had rejected the Mahakali project proposed by India because of the border problem at the headwaters. He further claimed that because of his government's nationalistic stance regarding Tinkar (Kalapani) and Mahakali, India imposed the economic blockade of 1989.[34]

Pashupati Sumsher J B Rana, erstwhile water resources minister in several governments but not in this Right-Left one, in an interview given to Binod Dhungel, executive editor of *Janata Saptahik*, on June 17, 1997 expressed amazement that the very forces which opposed the Mahakali Treaty now moving forward to exchange the instruments of ratification without incorporating the provisions of the 'sankalpa prastav'.

In what has come to be known as the 'Good Bye, Monika!' episode, two otherwise warring newspapers, *Dristi* of the UML and *Punarjagaran* of the Ganesh Man-Bhattarai (or alternatively, anti-Girija) faction of the Nepali Congress jointly hosted a farewell reception for a press officer of the Indian embassy at the pricey Shangrila hotel. The press officer had been responsible for assuring favourable press during the passage of the Mahakali Treaty. What was even more incongruous diplomatically was the presence of senior UML and NC leadership of ministerial rank at this reception.[35] An all parties' meeting of August 3, 1997 wanted the government to write a letter to Enron of Texas for investment in the 10,800 MW Karnali-Chisapani hydro-project. Enron publicised its intention to sell electricity to China some 3,500 km across the Himalaya to the north to the delight of left-wing comrades and to build the Arun3 project.[36]

By September 17, 1997, the much talked about and publicised completion of the preparation of DPR of Pancheshwar multipurpose project ran into deep waters after a proposal of water sharing put forth by a Indian technical team. Highly placed government sources who participated in the meeting of joint group of experts are reported as telling *Kantipur* daily that India came forward with an altogether new and unheard of proposal during the talks which stunned the Nepali technicians. Their proposal was that the sharing of Mahakali waters should be done only after ensuring that the flow of water to the lower Sarda project situated about 160 km downstream from the Sarda barrage at the Nepal-India border is assured as prior use. In fact, India made prior rights claims based on the size of its canals (built without Nepal's cooperation or permission) which amounts to more water than there is in the river itself. India thus used Article 3 of the Mahakali Treaty to its advantage as suspected by many when the Treaty was initialled.[37]

Lokendra Bahadur Chand's government collapsed between October 4-6, 1997 when differences arose in the RPP about the wisdom of unprincipled coalition with the communists. A government led by Surya Bahadur Thapa of the RPP was formed with the largest parliamentary party, the Nepali Congress, as junior coalition partner. On December 4, 1997, the six-month period for the preparation of the DPR stipulated in the Letters exchanged with the Mahakali Treaty and counted from the date of exchange of instruments of ratification lapsed with no progress. Those who opposed the Treaty as unequal and flawed in 1996 argued that the Treaty has lost its legitimacy and can be considered as having lapsed. There was talk that this is a 'procedural' matter, which can be sorted out bureaucratically, but the counter argument made is that only the body, which ratified the Treaty (two-thirds of the parliament), has the right to change it.[38] On January 9, 1998 the RPP split into the Thapa faction which is seen as pro-Mahakali Treaty and the Chand faction which is seen as opposed to it. On March 5, 1998, the Menshevik faction of the communists, most of whom abstained from voting for the Mahakali Treaty, broke away from the UML to form the Nepal Communist Party (Marxist-Leninists) or ML for short as opposed to the UML who were responsible for ramroding the Treaty through parliament.

Between April 10-12, 1998 the Nepali Congress forced Surya Bahadur Thapa to resign and formed a minority government

headed by Nepali Congress president Girija Prasad Koirala with support by the Mensheviks from the outside. In the new cabinet, Sailaja Acharya became deputy prime minister and minister of water resources. She openly advocated the 'Small is Beautiful' philosophy and mentioned flaws with the Mahakali Treaty for which she was attacked by the pro-Mahakali Thapa faction of the RPP and the UML.

In May 19, 1998 the Chinese deputy minister for water use and vice-president of Chinese Federation of Commerce and Industry Yan Kikung visited Nepal. In reply to questions of China buying electricity from Nepal from the Karnali and Arun3 projects, the minister said categorically that China had no intention of doing so, that for Tibet she was going to develop solar energy because of the dispersed nature of the settlements.[39] This came as a jolt to those Nepali politicians and policy-makers who have been sold on the dream of exporting electricity to China as well as India. The presence of Indian troops at Kalapani on the Mahakali was protested by students of the ML faction. Former foreign minister Rishikesh Shah said that the Indian troops moved in when he was in the ministry during the reign of King Mahendra who did not wish to irritate India any more than he already had.[40]

There was a campaign to discredit deputy prime minister Sailaja Acharya because of the letter she has had her ministry write to Enron on July 24 effectively not giving it the Karnali project survey license it had asked for. She and her ministry argued that Karnali was a multipurpose project and the issues involved were not just of electricity exports but also significant downstream flood control and irrigation benefit issues in India. This matter needed further discussions with the lower riparian and was related to how much progress was made in the difficulties regarding the Pancheshwar project and the Mahakali Treaty.

Against her were aligned not just the Thapa faction of the RPP but also her rival in the Nepali Congress led by ex-prime minister Sher Bahadur Deuba, the latter accusing Acharya of 'murdering' Karnali. In perhaps what could be the only event of its kind worldwide of a communist leader openly advocating for a multinational company the leader of the opposition UML and former prime minister Man Mohan Adhikary accused the government of cold-shouldering Enron and threatened to make this an issue.[41] The deputy prime minister was made to stand at the rostrum of the lower house and heckled for two hours. In her reply, she quoted the joint parliamentary committee members monitoring the Mahakali Treaty as saying that the Treaty was as good as dead, which infuriated the pro-Mahakali lobby. She, however, claimed that without adequate progress on the Mahakali Treaty, a new project such as Karnali Chisapani cannot be initiated since the issues in both were linked in terms of downstream water rights.[42] While she stuck to her ground, her party's central committee decided that Pancheshwar and Karnali Chisapani projects were not linked and that Enron should be invited for talks to give it the survey license.

On August 26, 1998, the breakaway Menshevik communist faction of the ML formally joined the Koirala government and took up cabinet assignments. In an article in a local weekly, former foreign minister and Nepal's permanent representative to the United Nations Shailendra Kumar Upadhyay mentioned that the commission agents against Sailaja Acharya were the very forces which ousted minister D P Adhikari from the water resources ministry during the panchayat days in 1979 when he initiated the small hydro development projects.[43] Deputy prime minister Acharya mentioned in an interview in the official daily that the 'water mafia' which has benefited from kickbacks in foreign aid projects would like to see her removed.[44] In a continuing bout of national amnesia, despite the Chinese deputy minister's statement six months earlier, prime minister Girija Prasad Koirala said to Japanese businessmen during his visit to Japan on November 5, 1998 that they should invest in hydropower development in Nepal and sell electricity to Indian and Chinese markets.[45]

The ML, which was ideologically closer to other communist factions, came under pressure from the other eight left groups ('aath baam samuha') to either force its Congress coalition partner to curb police activities against the Maoists and agree to other left demands or to quit the government. On December 10, 1998, all its ministers in the cabinet resigned en masse. On December 24, 1998, Girija Prasad Koirala again formed another government, this time with the UML as coalition partners on the condition that he recommends dissolution of the house and the hold fresh elections.

The leaders of the UML had met Indian prime minister Atal Behari Vajpayee in Delhi on September 19, 1998 and assured him that they would co-operate in furthering the Mahakali Treaty as they had done during its ratification. They assured him that they were doing this not for petty interests or a few billion rupees but for furthering friendship and bilateral relations with India.[46] The UML, in its Bhairawa meeting had passed a resolution demanding the DPR of Pancheshwar Project be prepared forthwith. Immediately upon assuming the portfolio of water resources minister in the new coalition, UML politburo member Pradip Nepal called for a meeting of senior officers of the water resources ministry as well as finance and foreign affairs secretaries of HMG and authorised the transfer of Rs 15 million from various projects to the Pancheshwar Project office for the preparation of the DPR.[47] This action was criticised by other left parties as unbecoming of a government which was effectively an interim government that was only mandated to hold fresh elections.[48]

II
Larger Questions

The three-year saga of the Mahakali Treaty presents itself as a forensic resource to study and understand Nepali polity and its relationship with its big southern neighbour. The Treaty is a classic case of "marry in haste and repent at leisure", as the current impasse over its implementation amply demonstrates. It is standing proof that for the major political forces in Nepal and their leaders, international treaties have value more for their outward form than for their internal substance, more to look 'nice' as 'development-oriented' politicians in the short-term than to have the nation benefit from their substance in the long term. Given the unseemly haste with which the Treaty was rammed through parliament and the barrage of pejoratives that was fired at those raising caution regarding the highest rockfill dam in the world in seismic Himalaya, it may be safely predicted that conflict and paralysis will probably mark the way forward unless redeemed by farsighted statesmanship. However, selective amnesia that filters out difficult questions of resource management seems to be pandemic among Nepal's political set, which does not leave much room for sanguinity.

The fact is that Nepalis are prisoners of their own hype. There is the pervasive and naive belief that global capital and/or the foreign aid machine would do the needful for harnessing the Himalayan waters and selling the electricity generated to India, after which they could be rich as the sheikhs of Arabia. Without adequate homework on the details of costs and benefits, as well as on the intense and complex bargaining required to realise these dreams, they will

find themselves ill-prepared to face the forces of the market. As in the past, it will lead them to a perpetual *post facto* feeling of having always received a raw deal. More fundamentally, the idea of generating electricity by harnessing Himalayan water, exporting it and developing the country from the revenue generated is simplistic on several counts, from hydrogeology to macro-economic finances. There has never been any serious articulation of what the multiple risks are, how much the actual revenue will be, or what linkage there is between water resources development and the eradication of pervasive poverty in the Himalaya-Ganga. Indeed, without such upstream-downstream linkages with the economy's overall capacity and development, the experiences of other countries from Ghana to Laos to Paraguay point to the possibility of such high-risk projects leading straight to impoverishment instead.[49]

A fundamental flaw of those 'marrying in haste' is to be unable to distinguish between the purpose of a Treaty and that of a DPR under the Treaty. The former is a political document that defines rights and the boundaries of those rights on the entire Mahakali basin. It is the job of politicians to secure those rights, and their success or failure is judged by how well they do this job. By demonstrating casualness and carelessness regarding the implications of Article 3 of the Treaty as well as Clause 3 of the Lohani-Mukherjee exchange of letters that form an integral part of the Treaty (re-initialled subsequently by two prime ministers), the current crop of leaders have not fared well their task of protecting Nepali rights and interests.

By contrast, the Pancheshwar DPR on which all aspirations are now pegged (or to put it more bluntly, behind which skirts major political leaders are currently hiding) is a technical engineering document regarding the construction of a very high dam – one of the highest in the world – within the framework of the Treaty. It cannot change or challenge that framework. It cannot negotiate rights on water nor can it negotiate the modality for fixing the price of electricity ('cost plus' or avoided costs'). Political leaders alone can do that, but being prisoners of their past, they show little will in being able to do so. The all-party parliamentary committees formed to find a consensus and guide the DPR preparation is 'as good as dead' and along with it the Treaty it ratified three-years ago with such fanfare.

Even on professional matters, government expertise and organisations that are supposed to do the expert homework on the technical issues have eroded their own credibility with their past unprofessional performance on Arun3 and other water resource-related issues. This sad state of affairs has come about because of political interference, failure of senior bureaucrats to stand up for professionalism, as well as the rampant growth of a culture of 'zamindari' research, an attitude wherein in-house homework is substituted with a total reliance on expatriate consultants. This has not only sapped their intellectual vigour but also made them incapable to providing sound professional advice to the medley of political masters of the day.

There has also been a less than satisfactory performance by other constitutional organs of the state. The crux of the matter from Tanakpur to Mahakali lay in defining the three adjectives of Clause 126 of the Constitution of Nepal – what constitutes 'pervasive, serious and long-term' issues in a resource sharing Treaty – and the Supreme Court was asked to do so in a writ petition. While the court ruled that the 'understanding' reached by prime minister Koirala in December 1991 was a Treaty that needed parliamentary ratification, it failed the petitioner on his second point, i e, whether the matter constituted an issue of "all encompassing, serious and long-term" and thus required ratification by a two-thirds majority. The court sent the matter back to the parliament for it to decide, and the parliament has, to this day with all their all-party committees, failed to do. Once the court has been asked to provide judgment on this issue, it should have done so (taking the help of appropriate amicus curae of experts if necessary) without saying, let the parliament decide and then we will judge whether the parliament's decision is correct or not. This is a major reason why the matter hangs in political and judicial limbo.

The Mahakali impasse has also forced upon us questions regarding the role of the 'durbar'. While it is fashionable not to see any wrong with the durbar since monarchy went constitutional in 1991, several things are worth noting. First, the current constitution gives joint executive powers to the durbar and the executive, and the durbar s role does include warning the executive of what it would see as improper in the larger national interests. Given that both the Tanakpur and Kalapani issues originated during the "active and dynamic leadership" of the durbar pre-1990, and the fact that it functioned as the *de facto* secretariat of the country where much of the relevant documents resided (as opposed to the *de jure* secretariat, especially since the 1975 second and the 1980 post-referendum third amendment of the constitution), its role in providing timely warning to the new Executive system was essential. This was not done.

In recent interviews, former foreign minister Rishikesh Shah has opined that Mahakali Treaty is not a Treaty but only a *note verbale* since it has not been approved by the durbar.[50] The point is moot since the Treaty laws in force do not have such a provision; but the legal right as well as moral responsibility to provide timely warning does rest with it under the present arrangements. This provision has not been used to benefit the nation in a timely fashion as far as the Tanakpur-Mahakali issue is concerned.

Second, the issue of Mahakali is now inextricably linked with that of the presence of Indian troops at Kalapani. How this relates to the durbar is in the following. Foreign troops were stationed on Nepali soil during the period of active and absolute monarchy, and the army – one of whose elementary functions is to guard the country's frontier from encroachment – is still under the durbar and not fully under the elected government under the present democratic dispensation. For such institutions not to have done anything about foreign troops on its soil raises many disturbing questions, and the durbars attempted aloofness on this matter can leave it open to interpretation of reluctant co-operation with the new dispensation.

In resolving the Mahakali impasse, national exercises are needed which rise above partisan interests not only of political groupings but also of the durbar and the rent-seeking bureaucracy in singha durbar; but how can that be achieved? While one can debate various ways of achieving it, one can at least begin by outline those activities that must not be done if a way out is to be found:

– Nepalis should stop reflexively blaming the Indians. They are only taking advantage of an attractive bargain at throwaway price offered by Nepalis with their lack of effective homework. Such a favourable situation would be something any party on the other side of the bargaining table would avail of.

– Those who wish to see the Pancheshwar high dam built should not continue to deny the obvious. A good beginning could be made by admitting that the Mahakali Treaty done in haste has serious flaws in it. A Treaty ratified with strictures is no ratification, especially since the Indian side has not accepted those strictures and the Nepali side cannot move away from those strictures. Very pertinent in this regard is the near absolute lack of any

debate within the Nepali Congress on this issue. While both the RPP and the UML/ML have seen debates on Mahakali, this silence on the part of the oldest and major centrist party of Nepal does not bode well for an open and democratic polity.

– Certain statesmen-like norms need to be established that do not misuse provisions of the constitution for partisan ends. If the court and the Constitution demand that a criterion for defining "all encompassing, serious and long-term" is required, parties in parliament should not shirk from that responsibility, but get that task done before moving forward with other resource sharing agreements whether bilaterally, multilaterally or through the private sector. Otherwise one merely exports Tanakpur-Mahakali type imbroglios into the future for other projects.

– There is no need to continue being prisoners of hot political rhetoric and hype. It has only divided the nation and put national leaders up for ridicule. The homework that should have been done before the Treaty was formalised has not been done even into this third year after it was signed (even though it was rather thoughtlessly promised in ratified writing to be done in six months); and given the complexity of the issues involved, both technical and socio-economic, there is little chance of its being completed well into the life of the next parliament. All indications point to the possibility that the hyped up benefits projected for this Treaty are just not there.

– The bureaucracy and their political masters should not shut off their ears to civil society voices. The Mahakali Treaty has been characterised, among other things, by the refusal of those in power to listen to any alternative arguments. Those arguments have now come to haunt all the three fractured parties in Nepal.

– If development is to be real and sustainable, there must no longer be any shirking from an honest assessment of the real capacity of national institutions and the need to build up these capacities. The project that the Mahakali Treaty aims to execute – Pancheshwar high dam – is, at 315 m, the second if not the highest rockfill dam in the world. The implementation of an engineering project of such a magnitude is replete with challenges and uncertainties, for meeting which the managerial and technical capacities of Nepali and possibly Indian water related institutions in their current stage of evolution are questionable.

There are also major lessons for India's water bureaucracy as well. Water resource management in the semi-arid tropics that is the Himalaya-Ganga, albeit punctuated by short monsoon cloudbursts, is a slow proposition which not only needs to assure fairness with the societies it is dealing with, but must be perceived and accepted as being fair as well. Agreements through political pressure, diplomatic manoeuvring and legal point scoring from a strong and large neighbour may bring forth agreements in the short term but, as Mahakali has shown, nothing will move forward in the long term. Even if it did, the social and political costs may make the victory too expensive. Since India is to be the major beneficiary of reservoirs in Nepal, it will have to go the extra length in providing creative leadership that is not just legally but morally unassailable. The need of the region and the times is for sagacious water management at the micro- and meso-levels so that agricultural, health and sanitation securities are assured, and its impact can be translated into quick and tangible economic benefits. However, given the continuing preoccupation of the Indian water establishment with new constructions and a failure to conduct a credible review of past mistakes, there is little hope that south Asia's largest water bureaucracy can provide the required statesmanship. This job is made all the more difficult because of the colossal vested interests built into the political economy of embankment and canal construction industry in India.

The answer therefore probably lies in growing activism, not only of the environmentalists but also of the judiciary, journalism and the sections of the bureaucracy that are concerned with issues of equity such as social and rural development wings. Therefore reassess, reconsider and renegotiate in good faith. Indian water and energy requirements on the ground are quite different from that which is projected by its construction-oriented water bureaucracy. Those requirements cannot be met at reasonable costs from the type of technology and programmes offered by the high dam option, at least in the short to medium term of the next 20 years. The same is true of Nepal's own needs.

Proper water management in the Himalaya-Ganga is a pressing need of today which has to be done based on principles of low cost options, short gestation projects, contractual reliability especially for industrial and agricultural consumers, national capacity building for effective maintenance and technology transfer, and a balance of equity in regional and urban-rural contexts. Given what has happened around the world, both in developing and industrialised countries in this regard, it is quite easy to see how the Mahakali option fails on these criteria compared to other paths and options.

The delegitimisation of mainstream political actors in Nepal, despite democratic polity, has its genesis in their inability to conceptualise modalities of ushering security to the Nepali people by addressing the eco-structural contradictions that the country is enmeshed within. The process is further aggravated by their inability to define the path of harnessing the country's resource, particularly water, to the advantage of the country's disadvantaged sections. The response by all political parties across the board to harness water resource *vis-a-vis* India has so far in the last half-century been one-track and rooted in the notion of sharing of the largesse from a mega 'project'. The end result has been many words but little or no deeds to show for the hype, leading to erosion of the state as an institutional resource and the crises in governance that the country currently faces.

The alternative approach of national capacity building, local government participation, use of cheap and reliable electricity to give national industries a competitive edge etc. would obviate much of the current ills in Nepali body politic. This approach (as opposed to that of only inviting external contractors and consultants) will enhance local resilience that will contribute to demonstrable societal well being. The difficulty, however, is in transcending the clogged filters within the water establishment as well as the current set up of political leadership in the country.

Notes

1 General secretary of CPN (UML) Madhav Kumar Nepal (who said on Nepal TV that the mango tree had really been planted by the UML but when time came for plucking the ripe mango, the Nepali Congress happened to be in power); former speaker of parliament Daman Nath Dhungana (who wanted credit for not allowing Tanakpur Treaty to be passed by the Girija Koirala government); and former Royal Palace bureaucrat responsible for the water resource portfolio during the panchayat years Govinda Das Shrestha (who wrote in *Kathmandu Post* of February 1, 1996 that "[the new Treaty] is indeed a happy occasion for all Nepalis...But it is an undertaking and obligation no political party or government can or should possibly balk at or withdraw from".)

8 The statist bias in all of this, both in Nepal and India, is obvious when one considers that amelioration measures were only limited to civil engineering structures: during the construction of the barrage, the bank cutting in Nepal from diversion works affected about 80 families, but they were not compensated. See Report of the Commission formed to assess the impact of the Tanakpur barrage agreement, also known as the Baral Commission Report (in Nepali: *Tanakpur Bandh Pariyojana Sambandhi Samjhautako Asar Mulyankan Sujhav Samity Dwara Prastut Nepal Ra Bharat Beech Tanakpur Bandh Pariyojana Sambandhi Samjhauta Ko Asar Mulyankan Pratibedan*, Falgun 3, 2049 (February 14, 1993), His Majesty's Government, Kathmandu.)

9 See Dhruba Kumar 1992, 'Asymmetric Neighbours' in D Kumar (ed), *Nepal's India Policy*, Centre for Nepal and Asian Studies, Tribhuban University. This publication also contains the draft Indian proposal of March 31, 1990 entitled 'Agreement between the Government of India and His Majesty's Government of Nepal on Mutual Co-operation'

10 See Baral Commission Report, ibid.

11 Information from delegation members who were told to come down for breakfast packed for departure while the two prime ministers had a one-on-one meeting. It is said that upon assurances from his bureaucrats that such an 'understanding' would not need to be presented to parliament that prime minister Koirala decided to initial such an 'understanding' on Tanakpur

12 Report in *Nepal Post*: 'Tanakpur Now To Be Resolved in Jakarta?', August 2, 1992.

13 See *Punarjagaran*: 'Ganesh Man Singh's Historic Letter – There is No Alternative to National Consensus', March 9, 1993.

14 See *Hindu Dainik*, 'Allegations that Speaker is the Opposition', September 3, 1992.

15 See editorial in *Suruchi Saptahik*, 'Need for Understanding in Water Resources Development', December 26, 1993.

16 See *Gorkhapatra*: 'Nepal-India Relations – Signing of the Water Resources Development Action Plan', December 29, 1993.

17 See interview: 'I Turned Down Mrs Gandhi's Request' in *Crosslines*, February 2-8, 1998, Kathmandu.

18 The members who put their signature on the so-called 'national consensus' were: Madhav Kumar Nepal and Khadga Prasad Oli of the UML (who are with the Bolshevik UML and not the Menshevik ML); Prakash Chandra Lohani (then foreign minister) and Pashupati Sumsher Rana (then water resources minister) of the RPP (both of whom subsequently became part of the Thapa faction of the RPP as opposed to the Chand faction); and Chiranjivi Wagle and Bimalendra Nidhi of the Nepali Congress (both known to be of the anti-Koirala Chhattise camp ('Group of 36', which abstained from voting and led to the fall of the Koirala ministry).

19 The wordings of Article 3 of the Treaty: "...and hence both the parties agree that they have equal entitlement in the utilisation of the waters of the Mahakali rivers without prejudice to their respective existing consumptive uses of the waters of the Mahakali river". Paragraph 3 of Article 3 of the Treaty: "The cost of the project shall be bourne by the Parties in proportion to the benefits accruing to them...". Clause 3 of the exchanged letters: "It is understood that Paragraph 3 of Article 3 of the Treaty precludes the claim, in any form, by either party on the unutilised portion of the shares of the waters of the Mahakali River of that Party without affecting the provision of the withdrawal of the respective shares of the waters of the Mahakali River by each party under this Treaty." This wording basically prevents Nepal from claiming financial benefits from its equal entitlement of the waters of the border river if it does not use it within Nepal and allows it to flow downstream.

20 August 29, 1996 *Samakalin* and August 31, 1996 *Janasatta*.

21 This was the issue that led to the item in the parliamentary stricture, during the Treaty's ratification, about the status of the Mahakali (of where and how it is a border river).

22 September 4, 1996 *Jana Aashtha*, September 6, 1996 *Bimarsha*, September 10, 1996 *Drishti*, September 17, 1996 Drishti. See also Keshav Lal Shrestha 1996: '*Mahakali Sandhi Ra Rashtriya Heet Ko Sawal*', Kathmandu.

23 September 21-30, 1996 *Himalaya Times*, *Prakash Weekly*, etc.

24 As per voting records in the joint session of both the houses (total strength of 206+60 members), UML chairman was absent, eight MPs voted against the Treaty (3 from UML, 3 from Workers and Peasants' Party, and 2 from Masal), 31 MPs abstained (26 from UML, 1 from RPP, and 4 nominated members of the King), and 220 MPs voted in favour of the Treaty.

25 See *WATER NEPAL*, vol 6, no 1, July 1998.

26 What exactly is the DPR or when and how it should be completed are points of intense debate. Water resources minister (at the time of the Treaty) Pashupati Rana mentioned in an interview to *Kathmandu Post* of January 21, 1997 stated: "The DPR on the Pancheshwar was all ready at the time the Treaty was signed". He also said in the same interview that the Nepali version of the DPR had been sent to India but that India had not responded, and that the formal instruments of ratification of the Treaty had not been exchanged between the two governments and was expected to be done during the forthcoming Nepal visit of Indian prime minister H D Deve Gowda. On the other hand, in a separate interview to *Kathmandu Post* on April 25, 1997, foreign minister Prakash Chandra Lohani stated that HMG had formally informed India of the passage of the Treaty together with the sankalpa prastav already in November 1996!

27 October 11, 1996 *Himalaya Times*.

Vol XXXIV Nos 10 and 11 March 6-13, 1999

Globalisation and Seed Security

There are high social and ecological costs linked to globalisation of non-sustainable agriculture which have been experienced in all commercially grown and chemically farmed crops in all regions. An attempt to understand corporate control over genetically-engineered crops heralding a new phase in the seed industry and to expose the threat posed to seed security by probing the case of transgenic cotton trials in India. 601

The UPOV system seeks to protect the interests of powerful seed companies, whereas our laws should focus on the interests of farmers as producers and consumers of seed. An alternative treaty being discussed currently would provide a forum for developing countries to secure their farmers' and breeders' rights. 579

Education in 1999-2000 Budget

A major component of the 'National Human Development Initiative' announced in the Budget for 1999-2000 is education, which is also one of the items of the prime minister's Special Action Plan. Do the programmes and financial resource allocations proposed in the Budget match these high sentiments? 614

Reproductive Health Care among Muslim Women

Reproductive health practices among Muslim women in India have been little researched, perhaps because of the notion of tight Islamic control over sexual behaviour and sanctions against contraceptive use. Findings of a study among Nagori women in Rajasthan yield useful information which can help in the construction of an appropriate health care package. 621

Public-Private Partnership for Urban Poor

While the case for public-private partnership for development for the urban poor would seem self-evident, in the absence of a comprehensive institutional framework, government and private organisations in India do not see the rationale of working together. The experience of the Slum Networking Project in Ahmedabad shows the difficulties of working with government organisations and points to the preconditions for a workable private-public partnership for implementing projects for the urban poor. 636

Empowerment

Can the belief that quotas on the basis of community, caste and gender, no matter how extensive, can by themselves bring about a radical, or even a perceptible, redistribution of power be anything more than wishful thinking? 589

Mirror Politics

With the immediate danger of a possible ban now behind us, it is necessary to go beyond identifying good and bad images of women to investigate the critique of patriarchy that a film like 'Fire' provides and the characterisation of the feminist self that it makes available. 581

State vs Market

Policy-makers and academicians from India and Russia met in a joint seminar in Calcutta in last December to discuss the similarities and differences in the situation of the two countries at the start of their economic reforms and their experience of the reforms. 585

Development and Displacement

Instead of appreciating that a conscious, articulate and rational population is a great national asset which is essential for democracy to take root in any society, the government in Orissa is treating every dissent as defiance and every assertion as insurrection. Findings of a study team to report on the situation arising from the acquisition by the state government of a large tract of agricultural land belonging to tribals for an alumina plant. 576

Tangled Thread

The government's decision to allow free import of Chinese silk yarn has depressed prices of local yarn and adversely affected silk growers who lack the wherewithal to improve the quality of their yarn. 578

Right Money

The monetary aggregation procedure in India bears re-examination in the context of the new monetary aggregates proposed by the Reserve Bank's Working Group. 631

Urdu and Its Future in India

RALPH RUSSELL (*EPW*, January 2-9, 1999) has wisely put the protagonists of Urdu in India in the dock for depending solely on government and administration, sitting with folded hands and not doing what they can themselves do for preserving and promoting their language and for beating their breast and whining before the powers-that-be, instead of counting their blessings and taking advantage of the favourable and positive factors.

No one who has the good and the future of Urdu in his heart can find fault with Russell's sincere and practical approach but I feel that his approach is somewhat divorced from the ground reality in India and is based on certain questionable assumptions.

Urdu is not synonymous in India with Muslim Indians as only 50-60 per cent of the Muslim population has declared Urdu as its mother tongue. But the circle of Urdu as a pan-religious language has been shrinking since independence and today perhaps 99 per cent of those who declare Urdu as their mother tongue are Muslims. And Muslim Indians face deprivation, rejection and frustration in many ways and so does Urdu because, in the eyes of the policy-makers, whatever Gopi Chand Narang, Jagannath Azad and Balraj Krishan may say, Urdu is the Muslim language and deserves similar rejection and deprivation.

To clear the air, let me say that Urdu without its script is not Urdu; it becomes a style of Hindi; perhaps one of its many dialects which Hindi embraces and which demographically fill its coffers and turn it into the National Language, the most widely spoken and written and understood language and, therefore, the link language. In this connection, I would like to draw Russell's attention to my article in the *Mainstream* of December 20, 1997. So preserving and promoting Urdu means Urdu with its own script which, as Ali Sardar Jafri once corrected me, is not Arabic or Persian but Urdu. If this is so, the favourable factors like use of Urdu in film songs and dialogues, wider audience in Dev Nagri script or in English translation, and the use of a Hindi-Urdu mix in everyday communication across the country are of not much consequence for the future of Urdu.

Urdu without its script will die out faster because Urdu, unlike European languages with a common Roman script and Indian languages with a common Dev Nagri script, has no homeland. Moreover, Urdu in Dev Nagri will be isolated from the international stream of Urdu which washes, apart from Pakistan, the Gulf, the UK and the US. This, in the long run, will be a loss to Urdu. Also Urdu will be totally cut off from its valuable heritage, as it is not possible to rewrite all the classical and the modern works in Dev Nagri.

Urdu in India is a victim of Partition like the Muslim community is. Unlike Athar Farooque, I do not regard the Urdu-speaking supporters of Congress or, for that matter, any political party as renegades to the cause of Urdu. I, however, know that many eminent 'supporters' of Urdu have prospered as the self-appointed Mujawirs of the Mazar-e-Urdu, serving as the smokescreen for the official indifference and rejection and as the drumbeaters of the generosity of the sarkar.

The state has done precious little for Urdu except opening departments of Urdu (sometimes with Arabic and Persian, as if Urdu was a classical language) in universities – thus setting the cycle of illiteracy into motion, to borrow Shamsur Rahman Farooqui's meaningful phrase. But having filled the departments, the Urdu PhDs, not to speak of MAs, have nowhere to go; Urdu qualification is not a marketable commodity; it is a certificate of unemployability. In any case, the cycle is now grinding to a halt.

No doubt, the central government set up the Bureau for the Promotion of Urdu, now rechristened as the National Council. I wish the Bureau/Council would publish an annual report on its achievements. I largely endorse what Aliq Ahmad Siddiqui has said on the basis of my endeavour of over 15 years in parliament to get it moving. But while the allocations have been misused or wasted, what is important is that, as compared to Hindi or any other national language, even Sanskrit, Urdu allocation have been very poor. The Bureau/Council is meant not to promote Urdu but to put the Urduwallah's conscience to sleep.

The real issue is the place of Urdu in education for Urdu-speaking children. Russell has correctly highlighted the distortion of the Three Language Formula by virtually ousting Urdu from its legitimate place as the First Language for those whose mother tongue is Urdu, then omitting it even as the Second or the Third Language. Except in Bihar, the formula has been reduced to Hindi, Sanskrit and English. But what is even more important is the non-use of Urdu as the medium of primary instruction, despite the constitutional mandate and the educational imperative. This right has been denied to Urdu-speaking children. Considering that 90 per cent of primary instruction is through government or municipal schools, it is no wonder that when the roots are cut, the watering of the leaves cannot prevent withering. The Urdu-speaking community has to struggle against this denial, along with other linguistic minorities in every state. This they have failed to do so far.

Urdu is not a foreign language brought to India by immigrants; it was born in India. Hence the rights and duties of the Urdu-speaking community cannot be equated with those of an immigrant community, say, in UK, as Russell has done. However, in the face of deprivation and denial, the Urdu-speaking community should have done everything possible to teach Urdu to its children, outside the school or the classroom. Hence I endorse what Russell has said about the indifference of the Urdu community in India whose children, today, cannot even correspond with their parents and cannot pronounce 'sheen' and 'Qaf' correctly.

I do not wish to rationalise this failure but the fact is that the community is too poor to run Urdu schools or classes. Also, the expanding circle of education has brought in first generation learners whose parents do not quite see what they are missing. Thirdly, in a developing economy like India, the state is the provider of education. Indeed the Constitution places this responsibility squarely on the state for all children up to the age of 14. Education has now been declared a Fundamental Right by the Supreme Court. The Urdu-speaking community cannot be expected to run a parallel school system or abdicate its rights.

Since Muslim children in many places attend maktabs to learn to read the Quran and to be taught the basic religious duties of a Muslim like namaz, sometimes along with the primary schools but also sometime as a substitute thereof, the local communities have arranged the teaching of Urdu in such maktabs. This certainly does not introduce children to Urdu literature but opens the doors for reading Urdu newspapers, magazines and books, if one has the time and the inclination. If Urdu is still alive despite suffocation in the Hindi belt, it is largely due to such utilisation of the maktab-madarsa system. Given the situation, I would not have Urdu expelled from the madarsa milieu, when I have no alternative to offer.

Finally, Russell has blamed Jagjivan Ram for opposition to implementation of the recommendations of the Gujral Report on Urdu. I am not aware of it. It is unfortunate that the Report has been largely gathering dust even though its author himself once headed the government, naturally with resurgence of hopes and expectations in the Urdu community which were belied. It is not a question of an individual, of Nehru, Zakir Husain and Gujral not doing what they sincerely wanted to do for Urdu; it is post-Partition politics and the identification of Urdu with Pakistan and Islam in the mass mind.

SYED SHAHABUDDIN

New Delhi

A Test Case

THE government's knee-jerk response to the Telecom Regulatory Authority's maiden attempt to fix telephone tariffs in demanding that the tariffs, which were to come into force from April 1, be put on hold is most unfortunate of course, but was perhaps to be expected given the sarkar's deep-rooted perception of itself as the fountainhead of all wisdom and benevolence. Though Mamata Banerjee's Trinamul Congress walked out of the Lok Sabha and threatened to continue to boycott the house if the TRAI's tariffs were not withdrawn, this was certainly not a case of the government, as in some other instances, succumbing to pressure from one of the smaller parties constituting the ruling coalition. Jagmohan, the minister for communications, it is clear, was waiting to crack the whip on the TRAI and Mamata Banerjee's histrionics provided just the cue he was waiting for to announce that "the government has decided to give policy directives to the TRAI to keep its proposals in abeyance". Perversely enough, the minister was supported by the entire opposition, including the Congress.

The government's action in staying the tariffs fixed by the TRAI cuts at the roots of the proclaimed policy reforms in respect of the infrastructure sectors, whether telecommunications or power or insurance, with the objective of efficient expansion of supplies and services through the induction of large new investment, advanced technology and, most important of all, competition. To attract potential competitors to the deeply-entrenched government organisations in these sectors, it was essential to hold out the assurance of level playing fields and towards that end the policy-making function of the government in these areas had to be separated from control over the parameters of the commercial operation of different suppliers and service-providers, which task was to be handed over to statutory bodies which were to be entirely free of government control in the areas of authority assigned to them. The setting up of the TRAI by an act of parliament at the beginning of 1997 was based on these admirable considerations. Under the relevant statute the TRAI has been assigned absolute power to fix telecom tariffs.

The merits of the new tariffs worked out by the TRAI apart, it cannot be denied that for the first time the whole process of fixing telephone charges has been conducted through public consultation and discussion extending over a whole year. In its order fixing the new tariffs the TRAI has set out the economic rationale and the basic premises of its decisions. The TRAI has also said that the new tariffs are being introduced on an experimental basis and their impact would be closely watched over a period of a year and changes made thereafter if found necessary. This open and transparent way of decision-making is certainly a world apart from that of the closed-door working of the bureaucracy and its vassal organisations. The argument that the TRAI's cost-based rebalancing of telecom tariffs by moderately raising phone rentals in rural areas and reducing STD and ISD call charges by phases over a three-year period offends equity considerations is without any basis. Quite apart from how much of a role the politician's ever-bleeding heart should legitimately play in decisions on the pricing of a service such as telecom, the known facts about the significant use of rural phones for making STD calls as well as the high proportion of STD/ISD calls in urban areas made from public call offices would suggest that the TRAI's attempt to make tariffs reflect better the actual costs of providing different services is not quite a conspiracy to rob the 'poor' and give to the 'rich' as it has been made out to be.

The inspiration for the opposition to the TRAI's tariffs is obviously different: it is really an amalgam, on the one hand, of the politician-bureaucrat combine's unwillingness to accept that something which was once such a coveted part its domain as the authority to decide on the pricing of telecom services is being taken away from it and, on the other, of the Department of Telecommunications' misguided effort to stack the cards in its favour as much as possible before the day of reckoning – when it has to face competition from private service-providers – even at the cost of jeopardising the basic objectives of telecom restructuring, which attitude is so manifestly in evidence also in the government's obdurate refusal to look beyond its nose in the matter of licence fees payable by private operators. In the present instance, it is typical of the mind-set of a government department that, in assessing the impact on itself of the tariffs fixed by the TRAI, the DOT virtually rules out all possibilities both of lowering of costs with newer technologies and improved efficiency and of expansion of demand as a result of reduced charges.

Clearly, the government's decision on the tariffs fixed by the TRAI will have long-term consequences for the growth of telecom services in the country through the entry of new service-providers, the induction of the latest technologies and greater efficiency through competition. Equally, the denouement here will be decisive for the changes that are under way or are being initiated in other critical sectors such as power and insurance. This is a fit case, therefore, for the prime minister to act to curb his minister for communications who, as we know from his previous incarnations in public office, has a penchant for acting the commissar. The leadership of the Congress, as the party in waiting to form the next government, has a similar responsibility to ensure that it does not adopt or encourage irresponsible and shortsighted postures in parliament just to embarrass the government.

NARMADA

Missed Opportunity

BY allowing the resumption of work on the Sardar Sarovar project, all that the Supreme Court has achieved is show its disinclination to play a pioneering role in setting precedents for facilitating the real involvement of people in development issues. The ruling, it may be recalled, was on a public interest litigation filed in 1955 by the Narmada Bachao Andolan (NBA), which is spearheading the protest movement of people who will be dispossessed by the project. Construction work was suspended at the site when the hearings began. The court has now permitted the height of the dam to be raised from 80.3 metres to 85 metres. It has, however, constituted a grievance redressal committee under retired Supreme Court justice P D Desai to submit, before April 9, a report on the status of rehabilitation of the oustees resettled so far.

The ruling appears to have resolved neither the immediate nor the fundamental issues that had been raised. Given that the Narmada project has been the subject of so many commissions and enquiries, it will be too optimistic to hope that the new committee will be able to arrive at any firm conclusions within the six weeks it has been given. More specifically, it has been asked to go over the same ground covered by another committee that the apex court itself had set up after restructuring an existing committee which had been constituted by the centre in 1993. The committee is known to have pointed to several serious difficulties in satisfactorily rehabilitating the displaced, but the court has chosen to keep its report under wraps instead of offering it for public scrutiny. Many of these problems have repeatedly come up before the court in the course of the last four years. The Madhya Pradesh government in its affidavit has pointed out that the sites for resettlement offered by the Gujarat government to those who would be displaced if the height of the dam was raised to 85 metres are not suitable ones. Interestingly, the Narmada Disputes Tribunal mandates that the oustees should be identified a full year before the submergence is due to occur. This has not been done for those who will be displaced this monsoon if the height of the dam is raised to 85 metres. The court appears to have been keen to dispose of the case rather than achieve any significant progress on the Narmada issue. As the court was no doubt aware, the Narmada project authorities acknowledge that the dam would become useful in terms of provision of irrigation water and generation of electricity only when it is over 110 metres high. In sum, the permission to raise the height of the dam to 85 metres is really a gesture in favour of the project. The court has also taken a stand on the issue of rehabilitation, stating somewhat facilely that displacement and resettlement are inevitable consequences.

In focusing on the immediate problems of the dispossessed, the fundamental issues that critics of the current development model have been raising with respect to large dam projects have failed to be addressed. Had the hearings of the World Commission on Large Dams been allowed to take place, it may have yielded a platform for wide-ranging public debate on some of these issues. The Supreme Court could have created such an opportunity by declaring that the Narmada issue can only be decided by a well-organised public enquiry. There is a precedent for such a course – the Supreme Court had ordered a public enquiry on whether the pharmaceutical product EP forte should be banned. This is in fact the manner in which public projects are decided upon in many countries, such as the UK. It is unfortunate that instead of exploring these vital long-term possibilities, a short-term view has been taken of what is after all one of the most significant issues of our times.

THE BUDGET

More Tokenism

Madhav Godbole writes:

UNLIKE elsewhere in the world, the presentation of the annual financial statement of the government has become a media event in India. The other striking feature is the influence which the chambers of commerce and industry seem to wield as compared with the contribution of the sector to GDP. India Inc is in evidence for weeks preceding and following the budget. Now that all the media hype is over, it is time to take stock where the budget presented by Yashwant Sinha has failed the country. The ingenious arithmetic used to artificially bring down the estimated fiscal deficit for the year shows the inability of the government to address complex issues. The interests of the states and the centre are diametrically opposite so far as mobilisation of small savings (SS) is concerned. Small savings is a major resource for funding the annual plans of the states However, the centre has been keen on keeping its fiscal deficit low. As a result, a number of disincentives have been introduced, from time to time, to bring down SS. This conflict of interest has to be addressed, if the interests of the states are not to be undermined. Merely leaving the SS out while computing fiscal deficit will not be enough.

The recommendation of the Tenth Finance Commission regarding devolution of 29 per cent of the proceeds of all central taxes to states is yet to be given effect to. The states will have to be given their larger share of devolution with retrospective effect in 1999-2000. The budget does not take note of the fund requirements for this purpose. The fiscal situation is so desperate that, like a drowning person, we are literally prepared to clutch at straws. A great deal was, therefore, made of the fact that the words "downsizing the government" were used by the finance minister for the first time! Tokenism has come to be the hallmark of all our national efforts. It was not therefore surprising that this so-called downsizing of the government has started and ended with abolition of four posts of special secretaries.

The proposal to set up an expenditure commission leaves one with a feeling of deja vu. A similar announcement was made by another finance minister, P Chidambaram, in his supposed 'dream budget' two years ago. The idea met with stiff resistance within the United Front itself and the commission remained on paper. Even if the present government's initiative meets with better luck, it is doubtful if the next government which comes to power will look at it kindly. It is worth recalling that the short-lived Charan Singh government had taken a similar initiative, but as soon as the Indira Gandhi government came to power in 1978 one of the first decisions which was announced by the then finance minister, R Venkataraman, was to disband the commission!

A great deal of the professed larger outlay for the rural sector is old wine. No tears need be shed over the renaming of certain schemes, but the BJP had to find a scheme to name after its own Deen Dayal Upadhyaya. The budget has taken hardly any new initiative to tax the services sector which is the fastest growing sector of the economy. The finance minister has once again skirted the issues of a statutory ceiling on government borrowing, a similar ceiling on government guarantees, laying down of a specific time-frame for reduction of the fiscal deficit below 3 per cent, privatisation of public sector undertakings, exit policy, amendment of outdated laws and improving the legal system in the country. The list is unend-

ing. If these and other pressing issues are to be addressed, government must have a long enough time perspective. We cannot afford to live from one budget to another.

SMALL SAVINGS

Not the Whole Story

PRACTICALLY all sections of the media have commented on the manner in which finance minister Yashwant Sinha has managed to reduce the centre's fiscal deficit by Rs 25,000 crore in the coming year by deciding that all small savings collections would hereafter be routed through a separate National Small Savings Fund in the Public Account. Thus the 75 per cent states' share of net small savings collections will be transferred to the states from the new fund without entering the central budget and only the remaining 25 per cent will appear as capital receipts of the central government.

In his budget speech, the finance minister has defended this decision to delink small savings from the union budget in the context of the demand made at the recent meeting of the Interstate Council for devising an accounting procedure whereby the share of small savings collections to which the states are entitled does not have to be reflected in the centre's fiscal deficit. What Yashwant Sinha omitted to mention, however, was that the states had made this proposal with a specific purpose in mind. They were protesting against the recent decision of the centre reducing interest rates on various small savings schemes as from the beginning of January and ordering a three-week freeze on small savings collections. Various states had individually protested to the prime minister against this move and also raised the issue at the Interstate Council as well as the National Development Council, saying that if the centre was so keen on reducing its fiscal deficit it should not do so at the expense of the states. The states were naturally resentful that the centre should have taken a decision on a matter of major interest to them – with as much as three-fourths of the net collections from small savings going to them – totally disregarding how it would impact the finances of state governments. There is no indication in the finance minister's budget speech or in his public statements thereafter that he has acceded to the demand of the states to restore the attractiveness of the various small savings schemes, interest rates on which had been lowered by the centre earlier and also to desist from taking decisions unilaterally in this matter in future.

It has also been a long-standing argument of state governments that the terms and conditions on which the states are given their share of net small savings collections are harsh and bear no relation to the cost the central government has to incur on these collections. Now that the centre has decided to create a separate National Small Savings Fund from which the centre and states would draw their respective shares, it is only appropriate that the cost of the borrowing represented by these collections should not fall disproportionately on the states. There is absolutely no ground, moral or economic, that entitles the centre to a special advantage over the states in this regard. All such matters should fall in the domain of the National Development Council and decisions must be taken only through the Council or its Standing Committee.

KARNATAKA

Crisis of Powerlessness

THE Janata Dal appears to be striving to demonstrate that internal power struggles (or shall we call them squabbles?) are most intense when there is the least to be gained. For a government which has barely six months in office, and a party which is on the brink of an election which will in all likelihood wipe it out, the Janata Dal in Karnataka is remarkably complacent. No one, least of all the chief minister, appears to be concerned with the deteriorating administration and lack of governance in the state. If the fact that there is a crisis in governance in Karnataka is not widely acknowledged, it is only because it has not manifested, yet, in a major breakdown of the law and order situation. But there is enough evidence that the lack of administration is striking at significant developmental gains that the state had made in the past. And the fault lies not only in the manner in which the ruling party has been conducting itself but in the almost pathological inability of the state's major political parties to act responsibly. It is not a chance occurrence that the state has not had a stable chief minister for a long time.

There have been tensions within the ruling party in the state for a long time. Even at the time when H D Deve Gowda became prime minister and the Dal agreed to Gowda's choice of his successor, the tensions were evident. Gowda's sons, who subsequently joined the state cabinet, were evidently his caretakers, keeping watch over Patel. But Patel proved to be no stooge, nor unfortunately a very able or efficient chief minister. And once Gowda came back to his home state, administration has practically ceased to function. Even so it is to Patel's credit that his government has dealt with the several episodes of communal tension, including the recent one in coastal Karnataka, firmly.

On Gowda's demand the central leadership of the party forced Patel to expand his ministry to counter caste disgruntlement – the vokkaligas it was felt needed a greater say in the cabinet. This was also meant to ensure that more of Gowda's supporters got cabinet berths. But Patel not only expanded his cabinet but reshuffled it so that some senior former ministers were demoted. This has led to some resignations which may become a flow, with Gowda's supporters even suggesting that they would rather the Patel government fell than continue to work under his leadership. And there is no doubt that it will, unless support comes from unexpected quarters.

It is not as if the other major parties in the state are in any position to take on the tasks of government. The state Congress has just seen a change of leadership, with the duly elected Dharam Singh, a backward class leader, being asked by the central leadership to step down in favour of S M Krishna, a former central minister and a vokkaliga. With this the Congress hopes to tap the caste votes, but leaves the lingayats more or less in the BJP fold, especially with the Janata Dal (and Patel) losing electoral appeal. However, the Congress is far from being ready for a quick election. It would much rather consolidate its bases in the six months now available. So it is unlikely to support any move to bring down the government. Similarly, the BJP has not done too well of late and will need to make recalculations about its minuscule non-urban base and is therefore none too keen to face an election. While neither party will want to be seen as propping up any faction of the current government, they may not be too keen on its collapse. In Karnataka today there is unfortunately no party which is quite ready to take on the reins of government nor for that matter even to propel the government to act by playing a responsible role on the opposition benches. This has had serious consequences for development projects in the state. Karnataka is on the verge of a power crisis and the power reforms bill has, as so many others, been waiting on the sidelines. It is an all-round crisis of powerlessness brought on by petty power politics.

On the eve of the central budget, macro-economic indicators pointed to the persistence of low real economic activities. The depressed state of the manufacturing sector, exports and the capital market has now continued for the third year in succession. The operations of the monetary sector and banks reflect co-existence of abundance of liquidity with low real economic activity M_3 growth has continued to accelerate, but growth in bank credit to the commercial sector, including in the form of investments, has sharply decelerated. The exchange rate has remained stable The annual rate of increase in the prices of manufactures has been subdued.

BARODA RAYON

Deeper in the Red

BELEAGUERED BARODA RAYON went further into the red in 1997-98. While the company's net sales fell by 30.8 per cent over the previous year, it suffered an operating loss as compared to an operating profit in the previous year. Despite a non-operating profit of Rs 9.5 crore, the company suffered a net loss of Rs 27.5 crore as compared to a loss of Rs 19.8 crore in 1996-97.

The AV Birla group, which was considering take-over of the company, backed out of its earlier decision after rayon prices crashed by Rs 20. Reportedly the company has now drawn up a new plan to turn the corner and is putting its rayon and polyester plants on the block. Further, it also wants to auction about 40 acres of land at its Fatehnagar complex in Surat in order to finance its plans to bring itself out of the red. While its total liability is around Rs 110 crore, the rayon plant itself is expected to fetch the company around Rs 50 crore, while the sale of property is expected to net another Rs 8-10 crore. The plan to sell off the two units and the land is apparently a part of a detailed restructuring scheme prepared by Arthur Anderson. Baroda Rayon has already sold off its office premises in Hoechst House in Mumbai in order to repay a bridge loan to Infrastructure Leasing and Finance Corporation. The decision to hive off some of its plants could be what the company needed, because due to lack of funds, none of the company's plants was working at optimum capacity. In fact while the rayon plant was making a loss of a crore, the nylon yarn unit added a further loss of Rs 3 lakh and the losses of the polyester plant were Rs 30 lakh. The only silver lining was that the tyre cord plant was breaking even – mainly because the leading tyre manufacturer MRF buys 60 per cent of its production and it has been given the number one vendor status by JK Tyre and MRF. It is estimated that the company requires just about Rs 15 crore to run all its remaining plants at full capacity. So the new strategy might just set things on track again. Baroda Rayon also plans to induct strategic partners into its different businesses such as rayon, nylon and tyre cord.

The company had earlier held discussions with Reliance on lending its polyester unit as a conversion unit for the latter, but is now engaged in talks with some large texturing units to sell the unit. It has also tied up with its dealers which has led to assured returns and better capacity utilisation. However, since the company was forced to buy polyester chips from the open market, the realisation from the unit was poor.

BRITANNIA INDUSTRIES

Higher Profits

The Nusli Wadia group company Britannia Industries witnessed an encouraging performance in 1997-98. While the company's net sales increased by 13.5 per cent over the previous year, operating profit improved by 38.1 per cent and net profit soared by 61.8 per cent. The company's bottomline was boosted by a lower interest charge (down 10.2 per cent) as compared to the previous year. Consequently, earnings per share was higher at Rs 15.6 as compared to Rs 9.6 in the previous year. Encouraged by its performance the company decided to raise the dividend from 40 per cent last year to 50 per cent. Book value, meanwhile, moved up from Rs 55.2 per share to Rs 65.2 per share.

The biscuits and dairy major claims that the growth in its earnings was achieved mainly through increased volumes, all-round cost saving and effective treasury management. Biscuit volumes were up 6 per cent mainly through the successful launch of the Tiger range in the mass market category and introduction of new premium products. The company has also entered the dairy market with the launch of cheese and dairy whitener and both these products have been well received.

The company's growth this year has come mainly because of satisfactory performance in the core bakery business and the success of its dairy products. Its focus on new products continues with the launch of it health range under the Nutri-choice umbrella. The company has pruned its product portfolio from 35 to 25 but has introduced several new products in the biscuits, dairy products and cakes sectors. After retaining the status of being the country's largest biscuit company for years, Britannia has now set out to challenge dairy market leader Amul which has a market share of around 50 per cent. In fact Britannia was the first to launch cheese slices in the market and it now estimates that it has a market share of around 35 per cent in the cheese category with the figure rising every month.

For the first nine months of 1998-99 Britannia Industries has notched up a net profit of Rs 28.7 crore on a sale of Rs 760.4 crore, which is an increase of 33 per cent and 22 per cent, respectively over the corresponding period last year. In fact, the company's performance and the euphoria in the stock market have driven its share price from around Rs 1,000 in January 1999 to Rs 2,000 at present. The company currently enjoys a phenomenal price to earnings ratio of around 77.3 on the bourses.

Depreciation for the current year is estimated to be higher than in the previous year due to the company's ongoing industrial restructuring programme. In the process of recasting, the company has planned to spend Rs 200 crore, out of which Rs 38.6 crore has already been spent in the last financial year. The company is now concentrating on its food and beverage businesses along with the modernising systems of packaging which has been undertaken by its French associate, Groupe Danone.

SHIPPING CORPORATION OF INDIA

Tie-Up with Oil PSUs

The country's premier shipping company, Shipping Corporation of India (SCI), saw a mixed performance in 1997-98. While net income increased by 6.4 per cent over the previous year, operating profit declined by 1.4 per cent. However, a higher non-operating profit and a lower interest charge for the year helped the company post a 5.6 per cent rise in its bottomline. The state-owned shipping giant has now drawn up a two-tier pricing formula for ferrying crude from the Arabian Gulf, whereby it will carry crude from the originating port to the first port of discharge on a per tonne basis calculated on the Average Freight Rate Assessment (AFRA) index compiled by the London tanker brokers' panel. The new formula replaces the cost-plus basis for pegging freight rates, which was abolished in the wake of the union cabinet's decision earlier to dismantle the

administered price mechanism on petroleum products.

SCI has a fleet of 115 vessels, 29 of which are crude tanker vessels of different sizes, making it the largest crude carrier and shipping company in the country. It accounts for over 50 per cent of the country's fleet. The company is the only shipping company which has an exposure to all segments of the industry, such as dry-bulk, tanker and containers. However, container operations are only a peripheral part of the company's business with the bulk of the income coming from tanker operations.

With the new pricing formula, which is to be implemented with retrospective effect from April 1998, SCI has in fact passed on the risks of shipping crude to the Oil Coordination Committee.

SCI is now planning to raise a minimum of $115 million through external commercial borrowings (ECBs) in order to part-finance the acquisition of four Aframax tankers. The total cost of buying the ships has been estimated at $144 million with each vessel having a $36 million price-tag. The balance funds will be financed through internal accruals. This is the second time that SCI is planning to raise ECBs to fund Aframax carriers. The company plans to acquire around 44 ships in the next few years in addition to planning to enter the liquefied natural gas (LNG) trade and the coastal and feeder markets.

The Disinvestment Commission is said to have proposed that the large PSU oil companies be allowed to pick up a stake in SCI. Since 20 million out of the total 35 million tonnes of cargo carried by SCI ships is crude oil, this is expected to be a good move as equity holding entails a kind of bonding. SCI has also entered into a pact with Indian Oil Corporation to become the nodal agency for carrying crude oil for the latter's refineries.

IVP

IVP has reported encouraging results for the nine months ended December 31, 1998. While sales increased by 152 per cent over the corresponding period last year, the company's gross profit improved by 51 per cent. Net profit too was up 52 per cent. The company's annualised earnings per share works out to Rs 11.5 compared to Rs 8.1 for the previous year.

Union Budget: Long on Words and Short on Funds

EPW **Research Foundation**

The budget for 1999-2000 has ducked two basic problems requiring urgent attention: one, the immediate issue of an acute liquidity shortage and recessionary conditions faced by Indian industry and, the other, the longer-term question of social deprivation faced by a majority of the population which reflects the serious weaknesses of the pattern of development pursued so far and which is increasingly proving to be a major constraint in accelerating economic growth.

IF there is one lesson that we can draw from the fiscal operations of the central government in the last few years culminating in Yashwant Sinha's second budget for 1999-2000, it is that they have ceased to be an instrument of economic and social development. They have now turned out to be a high-gear affair only to sustain a bloated central bureaucracy, to finance the huge debt servicing burden and to serve as an instrument for supporting the aspirations of the rich and middle classes. If we accept the view, as many intellectuals have begun to accept, that the government is incapable of shouldering a higher level of development expenditure for providing an impetus to development and to social sector activities, or that further increases in such government expenditure would only go to perpetuate inefficiencies and fiscal waste, we would then accept the mainstream stabilisation agenda and place the fiscal goals within a narrow construct. Viewed in that light, one could see some merit in Yashwant Sinha's latest budget.

First, the budget has flagged fiscal correction as the foremost goal and claims to have begun a medium-term process of eliminating the revenue deficit and reducing fiscal deficit to 2 per cent of GDP in the next four years. In 1999-2000 the revenue deficit, which has shot up successively for three years and reached a peak of Rs 60,474 crore or 3.4 per cent of the revised GDP in 1998-99, is expected to be reduced to Rs 54,147 crore or 2.7 per cent of GDP. In regard to gross fiscal deficit, the budget has succeeded in containing the absolute amount at Rs 79,955 crore, that is, roughly at the previous year's peak of Rs 79,949 crore after excluding the transfer of the states' share of small savings accruals or at Rs 104, 955 crore against Rs 103,737 crore inclusive of such transfer. As a percentage of the revised GDP, the fiscal deficit is proposed to be reduced in either case by 0.5 percentage point from 4.5 per cent to 4 per cent without the states' share of small savings or from 5.8 per cent to 5.3 per cent inclusive of such share. There is no ambiguity or lack of transparency in the numbers as many commentators have sought to make out. Based on the unrevised GDP series, the gross fiscal deficit of the centre worked out to 6.5 per cent for 1998-99 (against the earlier budgeted figure of 5.6 per cent) and it would decline to 5.8 per cent inclusive of small savings in 1999-2000; with the exclusion of small savings, the ratio based on the old GDP estimate would fall from 5 per cent to 4.4 per cent.

The above numbers are all set out in the budget documents and these suggest a steep deterioration in the fiscal situation in 1998-99, which has been sought to be corrected in 1999-2000. The decision to delink small savings collections – to be specific, the states' share of such savings constituting 75 per cent of the total – from the centre's fiscal deficit is a perfectly legitimate one and has been long overdue. Small savings collections have of late shown a healthy growth from Rs 25,927 crore in 1996-97 to Rs 39,552 crore (by 52.6 per cent) in 1997-98 and further to Rs 52,788 crore (by 33.5 per cent) in 1998-99 and obviously this should not be construed to be part of the fiscal malaise. Only Rs 8,000 crore or 25 per cent of the expected small savings collections have been included as part of capital receipts and hence part of the fiscal deficit of the centre for 1999-2000. The states would get Rs 25,000 crore out of the National Small Savings Fund in the Public Account, drawings from which do not require parliamentary authorisation; they are treated as such in the budget documents, quite appropriately.

Secondly, it must also be said to the credit of the finance minister that he has succeeded in projecting the above fiscal correction without his revenue projections appearing to be over-estimates as has been made out again by some commentators. The proposed increase of gross tax revenue by 18.9 per cent is inclusive of Rs 9,334 crore of fresh mobilisation, whereas excluding it the increase works out to 12.7 per cent which is broadly the expected rise in nominal GDP. Some allowance has been made for higher tax buoyancy due to possible improved compliance in personal income tax. Thus, exclusive of new tax proposals, personal income tax revenue is expected to rise by 16.2 per cent and customs revenue by 14.7 per cent, but corporation tax and union excise duties would rise by only 10 per cent and 11.1 per cent, respectively, reflecting the assumption of a modest growth of 6 per cent in industrial output. Inclusive of fresh levies, receipts from union excise duties will rise by 20 per cent, customs by 18.1 per cent, income-tax by 25.6 per cent and corporation tax by 14 per cent.

A third noteworthy aspect of the budget proposals relates to the attempt by the finance minister to desist from applying selective alterations in customs and excise duty rates, which in the past prompted lobbying by vested interests on the eve of the budget. There does appear to be some merit in the claim that the rationalisation of the duty structures – from 11 major ad valorem rates to 3 in excise and from 7 to 5 in customs – has been done by applying objective norms and has not been prompted by the demands of individual industries.

Yet another welcome feature of the budget concerns the proposals to involve village panchayats in executing and supervising the special social programmes relating to food, health-care, education, employment and shelter under the newly proposed national human development initiative (NHDI). Rightly, the release of funds by the central government has been made conditional on the initiative taken by the state governments and village panchayats, which should help to minimise the dependency psychology spawned so far by the centralised planning process.

Finally, the finance minister has respected the independence of the central bank and, unlike past finance ministers, has avoided announcing monetary policy measures in the budget speech. Though the minister and his ministry officials expressed their preference for a reduction in interest rates, thus echoing the expectations of businessmen in pre-budget discussions and memoranda, the formal announcement was left to the RBI, thus setting a healthy precedent. The steps taken by the RBI to slash the repo rate from 8

per cent to 6 per cent, the Bank rate from 9 per cent to 8 per cent and the cash reserve ratio from 11 per cent to 10.5 per cent have stirred up the markets and provided an expansionary impulse to market psychology, but the budget provides no guarantee that this propelling of market psychology would be supported and strengthened by an augmentation of domestic demand based on improved public sector investment and development outlays in real terms.

While there are thus some welcome features, the budget as such seems to have ducked the two basic problems requiring utmost attention – one, the immediate issue of an acute demand shortage and depressed growth and investment conditions faced by Indian industry and, the other, the longer-term question of social deprivation faced by a majority of the population which reflects the serious weaknesses of the pattern of development pursued so far and which is increasingly proving to be a major constraint in accelerating economic progress. The severe demand constraint faced by the manufacturing sector is largely attributable to three factors: a sharp reduction in public sector investment, erosion in the share of development expenditure in total expenditure of the central and state governments, and slower growth in bank credit as well as a decline in the proportion of bank credit earmarked for agriculture, small-scale industry and other informal sectors.

Reflecting the erosion of public sector investment and the government's development expenditure are the large and persistent shortfalls in the centre's annual Plan outlays in the past three years. There was a shortfall of Rs 9,568 crore in 1996-97, Rs 10,806 crore in 1997-98 and as much as Rs 16,705 crore in 1998-99. One of the important causes of this shortfall has been the rapid increases in the salary and pension bills of the central government. The total of such expenditures increased by as much as 33.9 per cent to Rs 29,627 crore in 1997-98. But this is not the whole story. There have occurred considerable revenue shortfalls too, as a result of reductions in tax rates and the recessionary conditions in the economy. There was a tax revenue shortfall of Rs 10,927 crore in 1997-98 – a year in which the government implemented the fifth pay commission's recommendations. There has occurred another shortfall of Rs 9,011 crore in 1998-99. The tax to GDP ratio in respect of the centre has steadily declined since 1995-96. Apart from the cynicism one would entertain because of the persistent shortfall in budgetary allocations for development expenditures, the size of expenditures proposed in the latest budget may at best help sustain the present level of depressed economic activity. Plan expenditure is slated to rise by 12.6 per cent which is just the rise expected in nominal GDP. Against such imperatives of increasing public expenditures, the give-aways of as much as Rs 8,000 crore, including a sizeable sum through the mutual funds and the capital market, could have been avoided. The sleight of hand adopted by the government to achieve disinvestment of PSU equities to the tune of Rs 9,000 crore in 1998-99 has been at the cost of 'internal and extra-budgetary resources of PSUs' under which there has occurred a shortfall of as much as Rs 12,504 crore for financing the central Plan outlay in 1998-99. And interestingly, such resources expected in 1999-2000 at Rs 59,521 crore would be even lower than those budgeted for in the current year (Rs 62,723 crore). To what extent the strategic disinvestment of PSU equities now proposed for 1999-2000 for a total sum of Rs 10,000 crore is responsible for this downgrading of the size of the central Plan outlay as compared with the budgeted figures of 1998-99 is a moot question. Such downsizing has occurred under all the major heads of central Plan outlays: agriculture and allied activities, rural development, irrigation and flood control, energy and industry and minerals. The revised estimates for the current year are so low as compared with the budget estimates that even the low provisions made for the next year still appear higher by about 10 to 35 per cent over them. To what extent the reduced investment horizons of the public sector enterprises are due to their limitations of absorptive capacity and to what extent they are due to reduced allocation of funds following stringency in Plan resources is difficult to judge without looking into individual cases, but a general observation that can be made is that the major PSUs represent a massive industrial base around which industrial expansion can be thought of by a multi-pronged strategy: higher industrial investment, industrial restructuring and strategic tie-ups. In this regard, if the Disinvestment Commission's reports have to be believed, the PSUs are not being allowed to operate on sound commercial lines, and their boards are not being given the autonomy required for them to take corporate decisions including those on investment restructuring and evolving strategic tie-ups. There is not even an iota of awareness shown in the budget about the pivotal role that the PSUs can play in reviving industrial investment in the economy.

It is in respect of the social sector that the budgetary allocations seem most disappointing, particularly in the context of the crying need for giving a decisive push to developmental activities in primary education, rural health infrastructure and other amenities. The budget gives considerable focus on local initiatives at the gram panchayat level which, on the face of it, appears to be a very welcome strategy, as stated above. But, considering the severe resource crunch faced by these self-governing bodies, the programme set out in the budget may remain a non-starter. For instance, while proposing a grandiose plan of implementing an Education Guarantee Scheme at the national level whereby it is proposed to provide an elementary school in every habitation within a radius of 1 km (*a la* Madhya Pradesh), the finance minister suggests that "initially, the local community would provide the premises and select a local person as a part-time teacher. Teaching material and other assistance will be provided by the central and the state governments, while gram panchayats will mobilise contributions from the local community in cash and kind for running the school for at least two years." There is no separate provision made in the budget for this. Instead, it is argued that the resources available under the existing centrally-sponsored education schemes will be mobilised to support this important initiative. That the budget does not provide the necessary thrust on primary education and that the budgetary allocations made would be inadequate for achieving the objective of expanding the coverage of primary education is evident from the allocation made for, say, nutritional support to primary education which has been slashed from Rs 1,400 crore in the revised estimates for 1998-99 to Rs 1,031 crore for 1999-2000. Of the increase of Rs 292 core under the head 'elementary education', Rs 190 crore is for 'non-formal education'.

Similarly, in regard to rural health care, the finance minister is long on words but hardly forthcoming on the provision of funds for upgrading the facilities provided at the primary health care centres. For the gram panchayats to qualify for central government funds, they will have to "come forward with their own contribution to set up primary health care facilities in their respective areas. This will match similar assistance from the concerned state government." Where will the funds come from? The budget again does not make any provision for it but the finance minister does pontificate: "Our goal is to integrate and synergise the existing programmes for health care, family welfare, rural development and related areas in different central ministries and to deploy the available resources so that every household secures ready access to both primary health care and family welfare services." A sure way of hiding behind words.

Where Assertion Is Insurrection

D Bandyopadhyay

Instead of appreciating that a conscious, articulate and rational population is a great national asset which is essential for democracy to take root in any society, the administration in Orissa is treating every dissent as defiance and every assertion as insurrection. Findings of a study team to report on the situation arising from the acquisition of a large tract of agricultural land belonging to tribals by the Orissa government for Utkal Alumina International in Kashipur tehsil of Rayagada district.

WITH a blood red hibiscus jauntily stuck in her bun, a middle aged tribal woman stood up with dignity and said in a measured tone clearly "what is the use of monetary compensation? Money is meant to be spent. Once spent there is nothing left. This land and this forest sustained our forefathers. They are sustaining us now. They would sustain our children and their progenies. We cannot leave them for a fistful of money. Without land and forest we would not survive. We shall not leave our land." The rest of the crowd numbering about 700 spoke in unison, "we shall not leave our land".

The venue was Kucheipadar village in tehsil Kashipur, district Rayagada in Orissa. A large tract of agricultural land belonging to tribals living in this village has been acquired by the government for Utkal Alumina International (UAIL). The alumina plant and the township would be located here. Most of the tribals refused to take the compensation money and are resisting eviction from their land. A few who under coercion took the money, had already spent most of it in search of suitable alternative land. Having failed to do so and having lost the money in the process, all of them were in deep trauma. Their plight made others more resolute not to take the compensation money and not to part with their land.

Vidhya Das of Agragamee, Kashipur, wrote two excellent pieces on the destructive impact of the mining projects on tribals and gross violation of human rights by the state and the corporate sector (*Economic and Political Weekly*, June 3, 1995 and March 14, 1998). The print media took some notice of the goings on in the backwoods of Rayagada and Kalahandi but that was not sufficient to rouse the conscience of the Indian intelligentsia to generate any pronounced support for the tribal cause. The matter came to a head when the government of Orissa in its intolerance and vengefulness issued showcause notices to four non-government organisations, i e, Agragamee, Laxman Nayak Society, Ankuran and Weaker Sections Integrated Development Agency (WIDA) for 'deregistering' and banning flow of funds to them from various state government departments and agencies and requesting the government of India to the do same. These four agencies had been working among the tribals of this remote area for nearly two decades trying raise their awareness, spreading literacy, training them in watershed management and better agricultural practices and the like. The government was surprised by the tenacity and the vehemence of tribal resistance for the last over six years. The organised resistance instead of dying down with the passage of time became more and more intense with greater mass support. The only explanation of this bewildering phenomenon in the government's mind was the presumed behind-scene-incitement by these four voluntary agencies. Hence this direct assault on the institutions of civil society.

The Council for Social Development, New Delhi, had been receiving representations and information regarding the adverse effect of bauxite mining on the tribals and environment since early 1998. It decided to mount a mission to study the situation at Rayagada with a view to assessing the ground realities and framing a policy package to defuse the situation and safeguard the interests of the tribals. The mission consisted of Muchkund Dubey, B N Yugandhar, B S Nagi and the present author.

The team visited five of the affected villages in Rayagada district, met state government officials – from the chief secretary to field-level functionaries – went round the offices of three among the four NGOs against whom the state government initiated punitive action and had discussions with the 'pro-industry' group of people who were always accompanied by a posse of policemen and company officials during the second and third week of January 1999. It produced a printed 41-page report by the third week of February 1999. ('Report on the Visit of a Team of the Council for Social Development: Rayagada and Bhubaneswar on January 11-18, 1999', Council for Social Development 53 Lodhi Estate, New Delhi 110 003 hereinafter referred to as the Report.)

The findings of this Report, which require to be shared with the intelligentsia of the country, have relevance to the state of governance in Orissa, particularly in relation to the special obligation of the government towards the tribals in the Fifth Schedule areas and the role of civil society in protecting and preserving the livelihood, lifestyle and culture of tribals in the region *vis-a-vis* the state government.

The team was given the impression at Bhubaneswar that there was overwhelming support for the three alumina projects of UAIL, Larsen and Toubro and Hindalco (Aditya Birla group) from the general population and that there were just a few recalcitrant elements, incited and provoked by the four NGOs, who were opposing land acquisition and industrialisation of this backward region. From the field visits the team was convinced that the impression given at Bhubaneswar that the affected people largely supported this move for industrialisation was totally erroneous. It appeared that there was a deliberate attempt to spread disinformation. All the villages were deeply attached to their land and they were not prepared to give up their land for a totally uncertain future.

What was ominous for any system of proper governance was the complete lack of trust between the affected people on the one hand and the state government and the companies on the other. "This is partly because of their frustrating experiences in the past, partly because of the shabby way in which they are being treated now, and partly because of the economic and social uncertainties surrounding their existence" (p 21). One of the villages summed up its experience with the local administration pithily: "We die of starvation. We die of diseases. The collector never comes to help us in these tragic moments. Now he has come at the behest of the companies. How can we trust him?" (pp 20-21).

The team found overwhelming evidence of excessive use of coercive methods by the district authorities against the tribals and scheduled caste population affected by these projects. "This has happend particularly in two villages: Kucheipadar and Sunger. In both these villages, hundreds of people including young boys and girls were arrested and taken into custody. In Sunger area, the company is alleged to have let loose goons to harass the villagers" (p 21). The district administration's reaction has been quite out of proportion with what the situation demanded. "On the whole, the villagers have not indulged in any gross infringement of the law or committed acts of violence.

They were only protesting peacefully against what they considered to be an infringement of their rights" (p 22). They resisted when they found survey, exploratory drilling, road construction activities being done on their land without their consent or even without any prior intimation. They did raise barricades on the road mostly to attract the attention of the administration to listen to their grievances. But they consciously avoided any militancy or violence lest their just cause got misrepresented.

The team felt that it was "undesirable to use the local and special police to prevent the affected people from meeting and organising themselves to express their grievances and voice their concern and opposition. Normally, the police have no role in this, unless specific crimes have been reported" (p 23).

The team was told by the highest level officer(s) of the Orissa government at Bhubaneswar that the government would not countenance any opposition to industrialisation of Rayagada by anybody or any group, that an anti-industry movement would tantamount to anti-state activity and that the government was determined to 'teach a lesson' to the NGOs which were indulging in acts of incitement by organising tribals against land acquisition.

On the ground, the team found ample evidence of unjustified highhandedness by the local administration. Such coercive measures produced contrary results. People became doubly determined to protect their land and forest resources. "Most of the villages we visited have set up Anchalik or Vanasampada Suraksha Parishads (regional or forest resource protection councils). The team found the villagers agitated, angry and determined to resist any intrusion of the company into the area" (p 23).

To the affected tribals of the region there was no distinction of identity between the mining companies and the government. They worked in unison, spoke the same language and behaved similarly. It appeared to some that on the 150th anniversary of the publication of *Communist Manifesto*, the government of Orissa was bent upon proving the point that "Political power, properly so called, is merely the organised power of one class for oppressing another" (*Manifesto of the Communist Party*, Progressive Publishers, Moscow, 1975, p 76).

One of the most disturbing and worrisome phenomeon that one encountered was the scant regard shown by the Orissa administration to the laws and the Constitution so far as these relate to tribals. The districts of Rayagada, Koraput and Kalahandi are Fifth Scheduled areas. The governor of Orissa, under the Constitution of India, has a special responsibility for the "welfare and advancement of the scheduled tribes" and for "peace and good government" in the areas under the Fifth Schedule so declared by the president of India. The team regretfully observed "that the administration was oblivious to the extent of being almost callous and insensitive to the constitutional obligations that the governor of the state has to the tribals in these areas". Under the Fifth Schedule (Clause 3) the governor has to send annual reports to the president regarding administration of the scheduled areas. One wonders what reports the governor of Orissa had been sending to the president of India for the last six years regarding "welfare and advancement of scheduled tribes" and "peace and good government" in the Rayagada, Koraput and Kalahandi districts. Under the Constitution "the executive power of the union shall extend to giving of directions to the state as to the administration of the said areas". It appears that both the state and the union governments had been remiss in not fulfilling their constitutional obligations towards the scheduled tribes in the Fifth Scheduled areas of Rayagada, Koraput and Kalahandi In their single-minded pursuit of promoting the cause of the three large corporations, the state government had been grossly negligent in performing its constitutional duties to the tribals.

The Provisions of the Panchayats (Extension to the Scheduled Areas) Act, 1996, provide for extensive powers to the gram sabha and panchayats in Fifth Scheduled areas. Section 4(i) states "the gram sabha or the panchayats at the appropriate level shall be consulted before making the acquisition of land in Scheduled Areas for development projects and before resettling or rehabilitating persons affected by such projects in the Scheduled Areas". This law makes prior consultation with the gram sabha and/or panchayats mandatory both in cases of land acquisition and preparing a resettlement and rehabilitation package for the affected tribals. There was no such consultation at any stage either for the purpose of land acquisition or for the R and R package. The most unfortunate part of the situation is that there has been no transparency about these mining projects vis-a-vis the affected population. There has been no communication except conveying premptory orders regarding lands to be acquired and compensation to be given.

The Report further observed, "None of the recent trends and requirements of rehabilitation, such as land-to-land exchange, wherever possible, community resettlement, employment security, protection of livelihood needs, *nishtar* rights or entitlements in common resources, has been taken into account. Neither the companies nor the government have made this information available to the affected or their organisations or to the voluntary organisations working amongst them" (p 26).

The most unsavoury aspect of the entire episode so far has been the direct assault launched by the state government on the four NGOs operating among the tribals in the back-of-beyond hills and jungles of south and south-west Orissa. These four voluntary agencies led by Agragamee have been carrying out development and conscientisation activities for the last two decades in the most backward and remotest tribal regions of Orissa. Over the years, they have achieved remarkable results, particularly in the areas of universalisation of primary education, ensuring food security at the household and community level in the drought-affected areas, watershed management, implementing government's pro-poor policies, strengthening grass roots people's organisations and organising the rural poor for asserting their rights and participating in the process of development. These voluntary agencies had to respond to and stand in support of the genuine concerns and worries of the project-affected people. With dissatisfaction spreading so wide and deep among the tribals due to inept handling of the situation by the administration, these NGOs are standing as a buffer between expression of dissent in a democratic form and open destructive militancy which is happening just across the border in Andhra Pradesh. The state's assault on these agencies and its attempt to make them non-functional will only encourage the militants who are waiting in the wings to take over. One shudders at the short-sightedness and the senseless policy of the state government in victimising these NGOs for supporting a genuine popular cause.

The campaign was launched by the government of Orissa to 'deregister' these four NGOs and to deprive them of any support and its letter to the government of India and other funding agencies to do the same "smack of vendetta and intolerance. This trend is unhealthy for the growth of the institutions of civil society, as well as for the socio-economic transformation of the area" (p 30).

In the twenties, while facing the second sedition charge in a magistrate's court in UP, Jawaharlal Nehru wrote: "It is a terrible thing when an organised government begins to behave like an excited mob, when brutal, vengeful and uncivilised behaviour becomes the normal temper of government." What Nehru wrote from his own personal experience seven decades ago unfortunately seems to be true even now in the Fifth Scheduled areas of Orissa.

Instead of appreciating that a conscious, articulate and rational population is a great national asset which is essential for democracy to take roots in any society, the administration in Orissa is treating every dissent as defiance and every assertion as insurrection. What an agonising situation! One wonders whether it was the virulent virus of 'liberalisation' which could so swiftly and so thoroughly corrode the underlying basic values of our polity enshrined in the Preamble, Chapter III Fundamental Rights and Chapter IV Directive Principles of State Policy of Our Constitution and make the instruments of the state, the bureaucracy, so insensitive, obdurate and callous to people's needs and aspirations.

Recently, there has been a change in the government in Orissa at the political level. There have also been some changes in the administrative level. The present chief minister, Giridhar Gomang, is a person from this area who knows the issues well. There is a lot of expectation that the present government would now make a serious effort to harmonise the need for mining with the tribals' right to livelihood, life style and culture. The least that should be done is to ensure compliance of the provisions of the Constitution, particularly those contained in the Fifth Schedule, and the provisions of the Panchayats (Extension to the Scheduled Areas) Act, 1996. Consultation with gram sabhas in matters relating to land acquisition and for resettlement and rehabilitation packages as mandated under the Act should be strictly adhered to. The punitive action initiated against the four NGOs should be withdrawn immediately. Criminal cases filed against numerous men, women and children for taking part in anti-land acquisition movement should be withdrawn. The government should take bold initiatives to settle the dispute through direct negotiation and discussion, allay the genuine apprehension about livelihood by a generous package of resettlement and rehabilitation prepared through proper participatory process and try to heal the hurt already caused by appropriate conciliatory measures. The situation is tense but can be defused. Let the industrialisation of Rayagada be a boon and not a curse to the tribals living there.

Tangled Threads

Silk Growers and Imports

M K Tikku

The government's decision to allow free imports of Chinese yarn has depressed prices of local yarn adversely affecting local silk growers who cannot afford to invest capital in improving the quality of yarn.

THE conflict of interests between silk growers and the silk trade and industry has been sharpening over the past few months. At the centre of the conflict is the government's decision, last October, to permit the free import of the superior grade silk yarn from China. Earlier, the import of the Chinese yarn used to be restricted to exporters against entitlements related to their actual export performance. One consequence of the free import of the Chinese yarn has been a 30 per cent fall in the domestic cocoon and yarn prices. That is why silk growers, who are mostly concentrated in Karnataka – the state accounts for about 65 per cent of the country's silk production have been demanding imposition of appropriate duties on the import of silk yarn.

The Chinese yarn is preferred by the weavers, especially by those operating the power looms, because of its better strength. But even when the exporters' genuine needs were met under the earlier import licensing arrangement, quantities of the Chinese yarn had continued to be smuggled through Nepal and Bangladesh. This was a consequence of the gap between domestic production and the industry's demand. In fact, the government's decision to allow free import of the Chinese yarn was based on the premise that it would discourage smuggling. According to the government, there was a shortfall of over 4,000 metric tonnes of raw silk, only about half of which used to be met through imports by the exporters under the earlier arrangement. But the free imports had swung the pendulum in the opposite direction. The slump in prices in Ramanagram, outside Bangalore, which boasts of running Asia's biggest cocoon market, would indicate that Chinese yarn had been coming in substantial quantities. What troubled the local growers even more was that the Chinese yarn was priced considerably lower. A number of silk farmers in the Ramanagram market insist that the Chinese were dumping the yarn at prices that were buffeted with hidden subsidies. Since the Chinese yarn trade was in government hands, there was no way to determine the extent of the subsidies.

With the Karnataka state assembly elections due later this year, many silk farmers hope that union commerce minister Ramakrishna Hegde will have to take note of their plight and impose duties on the Chinese yarn imports to bring its price in line with the domestic market. It has been suggested that such tariffisation would not clash with the WTO regime since a large number of those engaged in silk growing in Karnataka were small and marginal farmers. Such a move may provide some solution in the short run. In the longer-term, there would be no option but to increase domestic production since over 90 per cent of the silk yarn produced in the country was used up by the weaving industry as against a mere 15 per cent in the case of China, which left it with huge surpluses for export. A project funded by the Japan International Co-operation Agency (JTCA) in Mysore has, over the past two years, succeeded in hybridising the superior Japanese bivoltine silkworm variety so that it can withstand the Indian climatic conditions. This particular variety produces high grade yarn that compares favourably with the Chinese. It can also augment production per acre in a substantial manner. But since the Japanese hybrids are more vulnerable to viral and other infections, these require better hygienic conditions, including separate rearing rooms. All these call for fresh capital investments which most small and marginal farmers can hardly afford. The recent slump in cocoon/yarn prices has left them in an economic condition where they can hardly venture to experiment with the new varieties. The state government's extension services need to do better than they have.

According to the Karnataka government's department of sericulture, it has identified 3,000 families for introduction of the Japanese variety in the next financial year. The department is still trying to arrange Rs 2 crore it thinks it needs to meet the capital costs of the proposed extension scheme. That would mean less than Rs 7,000 in subsidy per farming family. That might be just enough to put a roof on the rearing room provided the former can afford to build it in the first place. By contrast, the Central Silk Board has got new machinery designed for reeling and other operations. This machinery, no doubt, will increase productivity but will also cut jobs. Well, the government is offering a package for those inclined to take the machinery which includes 30 per cent outright subsidy, 60 per cent as interest free loan, leaving a bare 10 per cent to be invested by the prospective entrepreneur. Why cannot the Karnataka government do something similar for the small and marginal silk farmers who would need it even more and afford it even less?

Protection of New Plant Varieties

A Developing Country Alternative

Suman Sahai

The UPOV system seeks to protect the interests of powerful seed companies who are the breeders. Our laws should focus on protecting the interests of farmers as producers as well as consumers of seed. An alternative treaty being discussed currently would provide a forum for developing countries to implement their farmers' and breeders' rights.

AFTER the conclusion of the Uruguay Round, India as well as other developing countries have accepted the *sui generis* option for the protection of new plant varieties. India has already drafted a Plant Variety Protection Act. In order to implement the law concerned with the protection of new varieties in each other's countries, nations need to work through an international platform. The Union for the Protection of New Plant Varieties (UPOV) is such a platform through which industrialised nations regulate the implementation of plant breeders' rights. UPOV came into being in 1961 with its headquarters in Geneva and it is the only platform of its kind today. There are over 30 members in UPOV, all developed countries.

Gene Campaign has opposed India joining UPOV because it does not address our needs. India must rise to the challenge of crafting an alternative treaty to UPOV that will meet the needs of developing countries. We need to provide a forum that will grant Farmers' Rights as well as Breeders' Rights and be geared to work towards food and nutritional security. However, the agriculture ministry is of the view that India should become a member of UPOV, a forum whose working is totally alien to the conditions of agriculture prevailing here. There is no concept of Farmers' Rights in the UPOV system; rights are granted only to the breeder. The UPOV system does not need to protect the rich farming community of Europe and America in the way that our seed laws will have to protect our farmers. It is clear that we have goals which cannot be fulfilled by the UPOV system. The UPOV system embodies the philosophy of the industrialised nations where it was developed and where the goal is to protect the interests of powerful seed companies who are the breeders. In India the position is very different. We do not have big seed companies in essential seed sectors and our major seed producers are farmers and farmers' co-operatives. Logically, our law will have to concentrate on protecting the interests of the farmer in his role as producer as well as consumer of seed. Once we are in the UPOV system, we shall be forced to go in the direction that UPOV goes. It is a system headed towards seed patents. Starting with its first amendment in 1978 when limited restrictions were placed on protected seed, the 1991 amendment which is now ratified, brought in very strong protection for the plant breeder. In this version, breeders are not exempt from royalty payments for breeding work and the exemption for farmers to save seed has become provisional. The UPOV now also permits dual protection of varieties, that means in the UPOV system, the same variety can be protected by Plant Breeders' Right (PBR) and patents. It would seem obvious that UPOV is ultimately headed towards patent protection for plant varieties. It would be wise for India to stay out of a system which has plant patents as its goal since that is neither our goal nor our interest.

The UPOV laws are formulated by countries which are industrial, not agricultural economies. In these countries the farming community is by and large rich and constitutes from 1 to 5 per cent of the population; their agriculture profile is completely different from ours. These countries do not have large numbers of small and marginal farmers, yet subsidy to agriculture is of a very high order. Because they produce a massive food surplus, farmers in industrialised countries get paid for leaving their fields fallow. In Europe agriculture is a purely commercial activity. For the majority of Indian farmers however, it is a livelihood. These farmers are the very people who have nurtured and conserved genetic resources, the same genetic resources that breeders want to corner under Breeders' Rights. We must protect the rights of our farmers and these rights must be stated unambiguously in our *sui generis* legislation.

Almost all agricultural research and plant breeding in India is financed with taxpayers' money. It is conducted in public institutions like agricultural universities and institutions of the Indian Council of Agricultural Research (ICAR). This research belongs to the public. The laws of UPOV on the other hand are formulated by societies where seed research is conducted more in the private domain than in public institutions; where private capital finances plant breeding. Because they invest in expensive breeding methods and need to secure returns on their investments, seed companies in Europe and North America seek market control through strong IPRs. These conditions do not apply in India.

Another feature that makes the UPOV system unsuitable for us is its sheer cost. At a seminar organised jointly by the Indian Council of Agricultural Research (ICAR) and the UPOV in Delhi last year, the figures that were presented for obtaining an UPOV authorised Breeders' Right certificate could be several thousands, even lakhs. Such rates will effectively preclude the participation of all but the largest seed companies. There certainly will be no space in such a system for small companies, farmers' co-operatives or farmer/breeders.

In developing countries, farmers play a significant role as breeders of new varities. They often release very successful varieties by crossing and selection from their fields. These varieties are released for use as such. In addition, in almost all cases, these varieties are taken up by agriculture universities as breeding material for producing other varieties. Such farmer/breeders would not be able to participate in an expensive system like the UPOV. Their material along with their labour and innovation would be misappropriated by those with the money to translate such valuable germplasm into money-spinning varieties registered in the UPOV. Poor farmers unable to pay the costs of getting an UPOV certificate, would tend to sell their varieties for small sums to larger seed companies. This will be the ultimate irony, creating an institution that will snatch away from the farmer his material and his opportunities. Gene Campaign and the Centre for Environment and Development present here an alternative treaty to UPOV to provide a forum for developing countries to implement their farmers' and breeders' rights. This treaty is called the Convention of Farmers and Breeders, CoFaB[1] for short. CoFaB has an agenda that is appropriate for developing countries. It reflects their strengths and their vulnerabilities. It seeks to secure their interests in agriculture and fulfil the food and nutritional security goals of their people. This treay between developing countries seeks to fulfil the following goals:

- Provide reliable, good quality seeds to the small and large farmer.

– Maintain genetic diversity in the field.

– Provide for breeders of new varieties to have protection for their varieties in the market, without prejudice to public interest.

– Acknowledge the enormous contribution of farmers to the identification, maintenance and refinement of germplasm

– Acknowledge the role of farmers as creators of land races and traditional varieties which form the foundation of agriculture and modern plant breeding.

– Emphasise that the countries of the tropics are germplasm owning countries and the primary source of agricultural varieties.

– Develop a system wherein farmers and breeders have recognition and rights accruing from their respective contribution to the creation of new varieties.

The salient features of CoFaB are as follows:

(1) *Farmers' Rights*: Each contracting state will recognise the rights of farmers by arranging for the collection of a farmers' rights fee from the breeders of new varieties. The farmers' rights fee will be levied for the privilege of using land races or traditional varieties either directly or through the use of other varieties that have used land races and traditional varieties, in their breeding programme. Farmers' rights will be granted to farming communities and where applicable, to individual farmers. Revenue collected from farmers' rights fees will flow into a National Gene Fund (NGF) the use of which will be decided by a multi-stakeholder body set up for the purpose. The rights granted to the farming community under farmers' rights entitles them to charge a fee from breeders every time a land race or traditional variety is used for the purpose of breeding or improving a new variety. Rights granted to the farmer and farming community under farmers' rights are granted for an unlimited period.

(2) *Breeders' Rights:* Each member state will recognise the right of the breeder of a new variety by the grant of a special title called the plant breeders' right. The plant breeders' right granted to the breeder of a new plant variety is that prior authorisation shall be required for the production, for purposes of commercial and branded marketing of the reproductive or vegetative propagating material, as such, of the new variety, and for the offering for sale or marketing of such material. Vegetative propagating material shall be deemed to include whole plants. The breeder's right shall extend to ornamental plants or parts of these normally marketed for purposes other than propagation when they are used commercially as propagating material in the production of ornamental plants or cut flowers.

Authorisation by the breeder shall not be required either for the utilisation of the new variety as an initial source of variation for the purpose of creating other new varieties or for the marketing of such varieties. Such authorisation shall be required, however, when the repeated use of the new variety is necessary for the commercial production of another variety. At the time of application for a plant breeders' rights, the breeder of the new variety must declare the name and source of all varieties used in the breeding of the new variety. Where a land race or farmer variety has been used, this must be specially mentioned.

In order to promote a more sustainable kind of agriculture and without any prejudice to the quality and reliability of the new variety, CoFaB enjoins breeders of new varieties to try to base the new variety on a broader rather than a narrower genetic base, in order to maintain greater genetic variability in the field. Further a variety for which rights are claimed must have been entered in field trials for at least two cropping seasons and evaluated by an independent institutional arrangement. The breeder at the time of getting rights will have to provide the geneology of the variety along with DNA finger printing and other molecular, morphological and physiological characteristics. The right conferred on the breeder of a new plant variety shall be granted for a limited period, depending on the variety.

In the event of a variety becoming susceptible to pest attack, the normal period of protection may be curtailed to prevent the spread of disease. In order to monitor this, periodic evaluations will be undertaken. The breeder or his successor shall forfeit his right when he is no longer in a position to provide the competent authority with reproductive or propagating material capable of producing the new variety with its morphological and physiological characteristics as defined when the right was granted. The breeder will also forfeit his right if the 'productivity potential' as claimed in the application is no longer valid.

To give primacy to the goals of food security, it has been provided in CoFaB that the right of the breeder will be forfeited if he is not able to meet the demand of farmers, leading to scarcity of planting material, increased market price and monopolies. If the breeder fails to disclose information about the new variety or does not provide the competent authority with the reproductive or propagating material, his right will be declared null and void.

Note

1 The CoFaB booklet containing the full text of the treaty can be obtained by sending a self addressed envelop (size 25cm x 18cm) bearing stamps worth Rs 20/- to Dr Suman Sahai, J-235/A Sainik Farms, Khanpur; New Delhi 110062

Mirror Politics: 'Fire', Hindutva and Indian Culture

Mary E John
Tejaswini Niranjana

With the immediate danger of a possible ban now behind us, it may be useful to look at 'Fire' more carefully and raise certain questions in the context of the recent controversy and acclaim. Shouldn't we go beyond identifying good and bad images of women to investigate the critique of patriarchy that a film like 'Fire' provides, and the characterisation of the feminist self that it makes available?

THE film 'Fire', directed by the Canada based film-maker Deepa Mehta, made a relatively unobtrusive entry into India a few years ago after its initial release in the west and other parts of the world: It was shown on video by a number of women's groups and at film festivals, and received mixed reviews in the Indian press, the international awards notwithstanding. Last year the film was cleared by the censor board for commercial screening, and, to the pleasant surprise of many, without any cuts. Indeed, 'censorship' took the unusual but significant turn of demanding solely a change of names – 'Sita', the younger sister-in-law, was to be renamed 'Nita'.

A few weeks after its opening across the country, the film hit the headlines with accounts of attacks by Shiv Sainiks who targeted the cinema halls in Mumbai and Delhi where 'Fire' was being viewed. In Mumbai the Shiv Sena action was fuelled by reports of a special screening for women only. In Delhi, the reasons cited by Shiv Sena and Mahila Aghadi members for the film's offensiveness ranged from its 'vulgarity' and 'lesbianism', to the "five-minute long abuse of an Indian national (Javed Jaffrey) by a Chinese". Soon after these protests and the controversy that ensued, Bal Thackeray himself publicly announced that he would have no objections to the film being re-released on condition that the names of both the female protagonists Radha and Sita/Nita be switched to Shabana and Saira.

As a result of the attacks at the New Empire and Cinemax theatres in Mumbai and Delhi's Regal cinema, 'Fire' was withdrawn from these cities. In the rest of the country, however, the controversy over the film had the opposite effect of expanding the number of venues and shows; in cities like Hyderabad and Bangalore, tickets were only available in black. Large public protests condemning the Shiv Sena action and the withdrawal of the film were organised in many places, spanning representatives from the cinema and the arts as well as feminist, gay and lesbian organisations. Numerous articles, even editorials, made their appearance. The opinions and responses of the director Deepa Mehta were especially sought after, in print and on television

It is worth underscoring the significance of the overwhelming support for the film and the broad-based public outcry against the attacks on it. As feminists who participated in the opposition against the film's unwarranted withdrawal, both of us were called upon to discuss the film, amidst the widespread acclaim that surrounded it. Women's organisations – and especially gay and lesbian groups who played a leading role in these counter-protests – raised key issues relating to questions of 'obscenity', on the one hand, and gay/lesbian rights, on the other. On the whole, however, these issues tended to get deflected if not lost in the dominant focus on the Shiv Sena attacks. Moreover, critiques of the film itself were muffled in an overall atmosphere that sought to protect the fundamental right of freedom of expression, and maintain as great a distance as possible from the agendas of the Hindu right.

Recent news reports tell us that, in spite of being sent back to the censor board, the film has been cleared without any changes whatsoever. In Delhi, Regal cinema is once again screening the film. This is a significant achievement. With the immediate danger of a possible ban now behind us, it may perhaps be useful to look at 'Fire' more carefully, and raise certain questions in the context of the recent controversy and acclaim. Does our wholehearted opposition to the Shiv Sena protests require that we celebrate the film? What are the responsibilities of feminist film criticism in the current context? Should not we go beyond identifying good and bad images of women to investigate the *critique of patriarchy* that a film like 'Fire' provides, and the *characterisation of the feminist self* that it makes available? Indeed, we would like to argue that a critique of the film is necessary in order to advance our understanding of questions of feminism and sexuality today.

'Fire' represents patriarchy as being founded on the denial of female sexuality. A whole range of oppressive structures targeting myriad aspects of women's lives become obscured in this narrowing of critical range, this compulsion to name a root cause of women's subordination. Control of female sexuality is surely one of the *ideological* planks on which patriarchy rests. But by taking this idea literally, the film imprisons itself in the very ideology it seeks to fight, its own version of authentic reality being nothing but a mirror image of patriarchal discourse. 'Fire' ends up arguing that the successful assertion of sexual choice is not only a necessary but also a sufficient condition – indeed, the sole criterion – for the emancipation of women. Thus the patriarchal ideology of 'control' is first reduced to pure denial – as though such control did not also involve the production and amplification of sexuality – and is later simply inverted to produce the film's own vision of women's liberation as free sexual 'choice'.

This reduction of woman to her body is accompanied by the equation of patriarchy with Indian culture and tradition, epitomised by the imprisonment of 'Radha' and 'Sita' (later changed to Nita) within the confines of the Hindu joint family. In a televised interview some years ago, Deepa Mehta had said that the film was about the changes in Indian tradition due to the new openness fostered by globalisation. Repressed female sexuality thus emerges yet again as the quintessential emblem of an oppressive 'traditional' culture in need of transformation by outside forces. The counter-agendas of the Hindu right – claiming to protect 'Indian culture' from the inroads of 'alien' sexualities – are but a mirroring of this prior construction and staging, whose colonial roots need no reiteration here.

The attraction and unconventionality of the film, especially for women, centre in its depiction of a lesbian relationship. And yet, Deepa Mehta has repeatedly disavowed any such identification: The film, she avers, is about loneliness, not lesbianism. "Lesbianism is just another aspect of the film. It is probably the last thing they resort to when they derive a certain confidence out of the relationship" (*Indian Express* interview, December 13, 1998). In another interview, she said that

lesbianism was 'only peripheral' to the theme of the film. "It is about how to be compassionate and in fact the film propagates tolerance" (December 5, 1998, PTI from *Matrix*). Most interviewers see her as 'fighting the lesbian label' – as she herself puts it: "If anything, the film's about choices. Hindu concepts of tolerance, non-judgmentalism, compassion. The incredible loneliness of being that's often the lot of women in India" (*Outlook*, November 30, 1998). Are we witnessing another kind of mirroring here, this time of hindutva, which claims that Hinduism's supreme virtue is, indeed, tolerance?

Taking their cue from Mehta's attitude, Madhu Jain and Sheela Raval in *India Today* ('Ire over Fire', December 21, 1998) speak about placard-waving lesbians stealing the limelight during the candlelight protest outside Regal cinema in Delhi. The "broader issue of freedom of expression and tolerance had got derailed by the lesbian debate", they say. A 'surprised Mehta', according to them, declares: "I can't have my film hijacked by any one organisation. It is not about lesbianism, it's about loneliness, about choices" (p 80). Shabana Azmi, who won an international award for her portrayal of Radha in the film, also participated in the print media discussion of the controversy. According to her, "love between individuals belonging to the same sex is only one of the issues raised by 'Fire'. The larger issue is that of empathy" [Azmi 1998].

Most film critics, with some important exceptions, have also failed to engage with the lesbianism of the film, preferring to look upon it as incidental. In the film itself, the narrative is set in motion by the negative, even traumatic, sexual experiences of the two sisters-in-law in their respective marital relationships: Radha, who is infertile, has to contend with a celibate husband who must also 'test' his celibacy in bed; Nita's boorish husband has rough sexual intercourse with her after their marriage, but spends the rest of his time with his girl-friend, a Chinese hairdresser. Though the younger woman displays some agency of her own – impulsively changing into men's trousers, lighting up a cigarette and putting on dance music soon after her arrival from a loveless honeymoon, and kissing her sister-in-law at an early moment in the film – this does little to mitigate the overall sense of these women's sexual victimisation. Such negativity therefore feeds the all too common stereotype that people become gay when deprived of normal sex. One is reminded of the media coverage over a decade ago when two police-women in a small town in Madhya Pradesh decided to get married. Elaborate accounts of these women's personal histories were produced to show how it was their suffering at the hands of a cruel society that drove them to such a decision; little allowance was made for the possibility of an affirmative sexual relationship. Both in this story and in 'Fire', the women are depicted as relating to each other only due to the non-availability of men.

It is one thing for a particular film to suffer from a reductive view of how patriarchy operates. But it is quite another when feminist critics effectively reproduce the problems inherent in the film on an even larger scale. Carol Upadhya's remarkable commentary on 'Fire' (*EPW*, December 12-18, 1998) does this through a form of argumentation that also proceeds via a series of mirrors: Indian culture is nothing but the male control over female sexuality, a belief held by the Hindu right, but also by our NRIs and the educated middle classes more generally. Stray conversations initiated by strangers on trains about the sexual permissiveness of the west are presented by Upadhya as ultimate proof of this essential core of Indian tradition. In Upadhya's view the women's movement in the west has successfully linked the struggle for gender equality with sexual freedom. However, Indian feminists, she argues, have been silent on the issue, and urgently need to launch a counter-attack by taking their cue from 'Fire'. This silence is all the more culpable because control over female sexuality, says Upadhya, is at the centre of all the other issues – of violence, family, caste and class – which Indian feminists had thought more pressing. The essay concludes by calling for a direct attack at the "root of both patriarchy and caste/class hierarchy" through the demand that "control over one's sexual and reproductive life, including free choice of sexual partner of either sex" be a fundamental right protected by law.

One is hard put to know where to begin in untangling the series of assumptions and conflations being made in this commentary. Are we being asked to believe that patriarchy and gender oppression have a single root cause located in the lack of personal sexual choice? When the women's movement first coined the slogan 'the personal is the political' the point was surely not to reduce the political to an unproblematic notion of the personal in which 'only the personal is political'. Indeed, the sharpest feminist critiques were those that interrogated the ideological construction of free choice, the compulsory institutions of heterosexuality, the sexual politics of visual pleasure, the patriarchal structures of the law, and so on. By Upadhya's logic, since most westerners "accept the idea that everyone has a right to define and control his or her sexuality and to choose their own relationships" (p 3177), patriarchy and domination should have vanished in the west, but for the presence of the Christian right.

This is not the place to provide an account of the ways in which sexuality has been a subject of activism and inquiry in the Indian women's movement and elsewhere. We have come to question the very notion of a conspiracy of 'silence' on our part.[1] Moreover, the idea that the west has successfully addressed and resolved issues of sexuality, while we remain mired in our repressions and misplaced priorities, is not just patronising, but open to considerable doubt.[2] This way of posing the problem takes us nowhere because it *reproduces exactly the same play of mirrors* in which the Hindu right is trapped. (A little over two years ago, women from the Hindu right attacked the Miss World contest in Bangalore for its encouragement of 'alien' western sexual norms. Why did not we go all out to defend and celebrate the beauty pageant's liberatory potential for us all?)[3] No one would deny that as a subject of scholarship, the field of sexuality in India is a relatively new one and still largely uncharted. But precisely for this reason it is conceptually and politically hazardous to jump to the most far-reaching conclusions on this theme.

A film like 'Fire', which draws on the aesthetic/political space of the alternative 'art' film, raises corresponding expectations regarding its feminist politics. We have already remarked on how women's oppression is seen to be exclusively anchored in the denial of female sexuality. All the characters in the film are actively sexualised in various ways, with the possible exception of the old widowed mother, bedridden and unable to speak. The prisoner of a paralytic body, she can only react helplessly, but with anger and disgust, at the displays of sexuality she has to see and hear. Otherwise, female agency is overwhelmingly translated in sexual terms. In a marginal figure like the Indian-Chinese girl-friend of the younger brother, agency takes the form of refusal – refusal to marry into and be suffocated by the joint family system. Subsequently we hear of her decision to leave India for a better life in Hongkong, suggesting that her sexual independence has no future here, not even in the heart of the capital, but requires the more liberated space of an east Asian modernity. (It is her father who berates

Javed Jaffrey about conditions in India, including its racism.)

As the relationship of the two sisters-in-law evolves, so too do their confrontations with their husbands, which is how the central narrative is propelled to its ultimate climax. The dramatic conclusion of the film shows Radha joining Nita in pouring rain at the Nizamuddin dargah after her 'ordeal by fire'. Simultaneously evoking 'sati' and 'Sita', but also dowry deaths, 'fire' has evolved into a powerful western stereotype of the Indian woman's annihilation by Hindu religion and culture.[4] Here, 'fire' symbolises the purity and goodness of the space of the couple, which is thus contrasted to that of the joint family, as though patriarchy lodges solely in the latter, and not in contemporary society at large, both public as well as private, 'traditional' as well as 'modern'.

But this is not the only way in which the agency of the women is structured by the film. In a significant scene, Radha discovers the servant of the house masturbating in front of a porn film (secretly procured from the family video shop). Radha's horror and disgust more than matches that of the mother-in-law; she demands that he leave the house, in spite of his pleas, and in spite of his threats to tell the family what he knows about her and Nita. Thus, in the film's own representational practices, sexual freedom takes the form of affirming the right of the two women to 'express' their sexuality, to leave the household to build a new life for themselves, but the affirmation is made against the vilified sexuality of the servant, whose actions result in his being cast out by Radha herself. In other words, we are shown the emergence of the feminist self being enabled in part by the rejection of other claims to sexual expression. The contrasts are stark: the women are treated with high seriousness, the male servant provides comic relief. The lighting and camera angles play up the women's beauty and satirise the servant as misshapen. The expressive and emergent feminist self becomes thus coded in the film as upper caste and middle class, defined against subjectivities that are neither.

The class-caste prejudices of the film are frequently echoed, albeit in a different mode, in the language of those protesting the protests against 'Fire'. Women's rights were commonly defended against the 'lumpen' and 'lunatic' vandalism of the Shiv Sainiks. Women Shiv Sainiks, members of the Mahila Aghadi, who led the charge in Mumbai were variously depicted as pawns, a "willing vehicle for diversionary violence" by male Shiv Sainiks, but also as 'mean' and 'phantasmagorial', stupid and ignorant ('The wrong end of the telescope', *The Times of India*, December 6, 1998). Over and over again, these protesters were condemned for their lack of decorum, a charge which has also been levelled in the past against women's groups, dalit protesters and left activists. Practically everyone, including the BJP, has sought to distance themselves from the attacks on the film, making it clear that 'civil society' will not permit modes of protest which are not endorsed by norms of parliamentary democracy. Our comment should not be read in any way as a gesture of support for women Shiv Sainiks' attacks on 'Fire'; all we want to do is draw attention to how we affirm the idea of women's 'liberation' in opposition to the repressed 'Bharatiya Nari' whose 'violent sublimation' is manifested in going 'berserk'. Rethinking these simple oppositions may help us interrogate those ideas of liberation which have entered feminist common sense and thus become exempt from critical scrutiny.

The counter-protests – particularly those by lesbian and gay groups – have helped to foreground two critical issues, both of which have been unsatisfactorily addressed in the women's movement so far. The first is the question of 'obscenity', which dates back to the 1970s, when women's groups across the country blackened film hoardings with explicitly sexualised images of women. We have come a long way from the days when depictions of sex and violence were automatically clubbed together as a common problem for the movement. However, the dominant feminist attitudes towards the so-called 'objectification' of women in the media have not really changed significantly. In fact, these attitudes are currently undergoing a revival amidst widespread panic over the perceived proliferation of visual sexual images under globalisation. During the 'Fire' controversy, many feminists were, perhaps for the first time, on the 'other' side, joining the ranks of those who sought to criticise the relationship between sexuality, obscenity and censorship. Does this indicate, then, that a questioning of hitherto well-entrenched positions is under way?

It is as yet unclear whether such a conclusion is justified, especially in light of the visual politics of the film itself on the very question of obscenity. 'Fire' actively promotes the othering of pornography by suggesting that pornography's primary function is to corrupt. The potential objects of such 'corruption' range from non-middle class men like the servant to the bodies and minds of children (one scene focuses on young schoolboys eager to check out blue films at the video shop). Through these self-reflexive gestures, 'Fire' effectively elevates itself onto an aesthetic level of distinction unsullied by the immorality and indecency associated with pornographic sex.

Some commentators have tried to undermine the Shiv Sainiks' claims of protecting Indian culture from immorality, by providing long lists of all the "obviously prurient and semi-pornographic films" in Delhi which the Sena members left untouched during the attacks on 'Fire' [Bidwai 1998:9]. One suspects, therefore, that a wholly different category is being employed in the dominant discussions of 'Fire': The freedom of expression of 'Fire' cannot be censored because it is not obscene: rather, it is 'art', unlike pornography, beauty contests, or commercial Hindi cinema.

It is not accidental that the very sections of the women's movement most outspoken against obscenity have also tended to view sexuality primarily as a gay and lesbian problem. As lesbian feminists have had to point out repeatedly, such an understanding not only naturalises heterosexuality as institution and 'choice', but completely fails to recognise the multiple structures of heterosexual privilege which have marginalised homosexuality in the first place. Whatever subversive potential 'Fire' might have had (as a film that makes visible the 'naturalised' hegemony of heterosexuality in contemporary culture, for example) is nullified by its largely masculinist assumption that men should not neglect the sexual needs of their wives, lest they turn lesbian.

It is particularly disingenuous that most commentators on the 'Fire' controversy have been writing as though the Hindu right in general and the Shiv Sena in particular were the sole proprietors of patriarchy and sexual intolerance. Only a few years ago, leftist writers in Andhra were second to none in their vituperative attacks on some feminist Telugu poets for writing allegedly 'blue' poetry. In a different vein, during the 16th congress of the CPI(M) held in Calcutta in October 1998, the general secretary of the All India Democratic Women's Association (AIDWA) publicly and dramatically withdrew her membership from the central committee in order to draw attention to the resilient patriarchal structures of the party, which has no women activists represented in any of its higher bodies.[5]

We may have some justification in scoffing at the Mahila Aghadi for believing, for instance, that lesbianism would lead to the end of reproduction and future

population growth. The occasional commentary provides bits of information about an authentic Indian tradition of lesbianism as further proof of 'their' ignorance about 'our' culture. But how well-informed are 'we' really, or Deepa Mehta for that matter? If the last decade has witnessed greater visibility around gay and lesbian issues, this is overwhelmingly due to the efforts of gays and lesbians who have received too little public support from the women's movement or other democratic organisations. Heterosexual feminists in India show few signs of being aware of the costs and risks lesbians bear on a daily basis, both in their private and professional lives, nor of their complex strategies of survival.

Nevertheless, the 'Fire' controversy can justly claim credit for having made lesbianism publicly visible, even acceptable. The term is now frequently heard in the media, and continues to be a common subject in conversations. School children in Delhi, we have been told, refer to 'Fire' as a film about 'shaadi between women'. At a women's studies refresher course for college teachers held at Jadavpur University in Calcutta during the height of the controversy, participants demanded that homosexuality be debated at an early point in the course. Many gays and lesbians across India are producing readings of 'Fire' that foreground the issue of same-sex relationships. A broad-based 'Campaign for Lesbian Rights' has been formed in Delhi in the wake of the controversy to build awareness that "discrimination on the basis of sexual orientation/preference is a violation of basic human rights", and to counter the widespread misrepresentation of lesbian lives in the media and society. 'Fire' has thus become a rallying point for gay people who see it as an occasion to reiterate their commitment to the public discussion of sexuality and sexual preference.

Such is the democratising potential of the commercial circuits of the cinema in India that the controversy around 'Fire' has been able to feed into the public sphere and create spaces for hitherto marginalised struggles that go much beyond the problematic politics of the film itself. We have argued, however, that attention must be paid to the film's specific framing of questions of women and sexuality because of the impact such framing is likely to have on feminist politics, and more generally on popular notions of feminism. We suggested that 'Fire's' unreflective class-caste assumptions help characterise the feminist self as one carrying certain markers of privilege even as it claims a form of victimhood. We also pointed out that 'Fire's' representation of the relationship between patriarchy and female sexuality mirrored the former's reductive biologism. The task that lies ahead for the women's movement would involve, it seems to us, not only a refusal of the normalisation of the heterosexual self but also a dismantling of the feminist self's hidden caste-class and community markers. In this task we need to shape a politics that does not lapse into the mirror-play retailed by the film, the Hindu Right, and some liberal/left initiatives.

Notes

[We would like to acknowledge the use of the *Fire* dossier at the Centre for the Study of Culture and Society, Bangalore, and the media file at the Centre for Women's Development Studies, New Delhi.]

1 To take but a few examples from within scholarship in India, see Uberoi (1996), Thapan (1997) and John and Nair (1998).

2 The western literature on the subject might be vast; but this hardly implies that questions of sexuality have been resolved. For different accounts – sympathetic but critical – of the feminist debates or 'sex-wars' of the 1980s, see Rubin (1984), Rich (1986) and King (1990). Gayle Rubin's essay is particularly noteworthy for its sense of disappointment, if not betrayal by the exclusionary sexual politics of other feminists.

3 The Bangalore contest was attacked by both left and right groups, including AIDWA/CPM, NFIW/CPI, KRRS, and the BJP. For a fuller discussion of the limitations in the political vocabulary employed by the protestors against the beauty pageant, see John (1998) and Niranjana (1999).

4 For a fuller elaboration of this stereotype in the context of the United States, see Uma Narayan's discussion 'Cross-Cultural Connections, Border-Crossings and "Death by Culture" ' in Narayan (1997).

5 In its 10-page coverage of the CPI(M) congress, even as reputed a journal as *Frontlin* (November 6, 1998), which frequently take up the cause of gender justice, found itsel unable to do more than 'mention' the issu raised by the AIDWA general secretary. It i ironic that right wing political leaders lik Uma Bharati have been much mor forthcoming in the media about the problem faced by single women in the BJP.

State Regulation *vs* Market Forces

Experience of India and Russia

Debdas Banerjee

Policy-makers and academicians from India and Russia met at a joint seminar, 'State Regulation versus Market Forces in Transitional Economies'. They discussed the similarities and differences in the two countries' situation at the beginning of economic reforms and in their experience of the reforms.

THE Indo-Russian Joint Seminar, as part of the Indo-Russian Joint Commission for Co-operation in Social Sciences, working since 1992, was held at Centre for Studies in Social Sciences, Calcutta in collaboration with Indian Council of Social Science Research, on December 10 and 12, 1998. This year the theme was: 'State Regulation versus Market Forces in Transitional Economies'. "Analysis of positive as well as of negative experiences of our countries in carrying reforms therein, will help to find solution of the problems arising in the course of their implementation and to secure necessary correction and improvement in the reforms within the concrete environment peculiar to each of the countries" – this message from J N Selezniov, (chairman of the State Duma of the State Assembly of the Russian Federation) briefly stated the objective of the academic exchange.

Igor Bratischev's (MP and chairman, Parliamentary Sub-committee for Regional Socio-economic Development, the State Duma of the Federal Assembly of the Russian Federation) paper, 'Russia: Economic Foundations for a National Anti-Crisis Programme', explained the man-made systemic socio-economic crisis in Russia. The situation this early autumn can only be described in terms of the 'theory of catastrophes'. The main cause of the national catastrophe that Russia experiences now is an anti-national orientation of the economic and political course being implemented by the comprador, mafia-type, corrupted rulers of Russia; the course which is directed to dismantle the country's economic potential, undermine its competitiveness at both international and domestic markets, sharply reduce production in the leading sectors of national economy, and obviously ignore social factors. The reforms during 1991-98, implemented by force and under control of foreign experts, have led to a disintegration of the economy, degradation of the science, culture, industries and agriculture, pauperisation of 80 per cent of Russia's population, and a sharp lowering of Russian citizen's longevity. The country is quickly transforming into a raw material appendage of the west. The collapse of the financial system in August 1998 was the result of accumulated indebtedness in the form of a financial pyramid made of sovereign short-term bonds, capital flight, and the loss of confidence in the authorities. The monetarist policy of socio-economic transformations implemented by the government during 1991-98 became the main cause of Russia's misfortunes.

Sergey Glaziev's (director, Research and Information, Federal Council of the Federal Assembly of the Russian Federation) paper, 'Key Measures for a Transition to Economic Growth', analysed the switch of money supply into speculation and the suppression of inflation by means of restricting money supply, that have caused the demonetisation of the real sector of the economy and, consequently, a payment crisis and a budget crisis. The state policy of promoting and supporting speculative instruments of market regulation, particularly the emission of super-high-yield government bonds and the build up of the government debt, resulted in an even more rapid outflow of capital from the productive sphere into treasury bills speculation, a further aggravation of the payments crisis, and a decrease of tax revenues. The second circle of cause and effect constitutes the collapse of demand, curtailment of production, increase of costs, and the decline of competitiveness. These two vicious circles induce a third: the lowering of production efficiency and the reduction of investments. The fourth circle, that is, the bankruptcy of productive enterprises, loss of national control over them, and the colonisation of the country, bring full circle the negative feedback, which perpetuates the processes of economic depression and the degradation of the productive sector. The de facto failure of mass privatisation as an instrument for the creation of effective property owners, against the backdrop of the outflow of capital from the productive sector and the disintegration of the economy, encouraged the development of predatory motivations in business behaviour. To maintain a balance between inflation, growth and currency stabilisation, the central bank and the government are forced to guarantee high returns on investments in the government debt pyramid that prevents the growth of aggregate demand in the currency and commodity markets. The following parametric values summarise the current state of equilibrium:

- Treasury bills yields – 20-30 per cent;
- central bank refinancing rate – 20-30 per cent;
- profitability in the productive sector – 5-7 per cent;
- capacity utilisation in manufacturing – around 40 per cent;
- unemployment – 10-15 per cent; and
- inflation – around 10 per cent.

Igor Fominsky's (director, All-Russia Research Institute under the Ministry of Economy of Russia for the Studies of External Economic Relations) paper, 'The Role of External Economic Policy in Protecting Russia's National Interests', focused on the problems arising out of the increased dependence of the Russian economy on external relations. During Soviet rule the exports-GDP ratio never exceeded 5 per cent, whereas in 1996-97 it was 26 per cent. However, the dependence on fuel and raw material industries as exportables has increased significantly; 43 per cent of the aggregate oil extracted, 34 per cent of oil products, 36 per cent of gas, 72 per cent of mineral fertilisers, and 85 per cent of the domestic production of cellulose are now being exported. On the whole, fuel, raw material and semi-finished products together accounts for over 80 per cent of Russia's exports. The shrinkage of domestic market has made the enormous export growth in these sectors possible. This has precipitated a crisis. The European oil market – the key market for the Russian oil export – is saturated *inter alia* due to the growing oil production in the North Sea. The east European countries in their effort to reduce the imports of oil and oil products have been cutting supplies from Russia. There are certain reserves for expanding export deliveries of Russian gas. The Russian metal exporters are also faced with intense competition.

The hasty liberalisation of the external economic relations has heavily damaged the domestic industry. It was obvious that the manufacturing sector which for decades developed in a closed economy would not stand competition from the west. The situation was further aggravated by the disintegration of the Soviet Union and Comecon, hyperinflation, and collapse of domestic demand. Not only hi-tech industries but also light and food industries

found themselves in dire straits, in turn affecting agriculture. Without the protection of the domestic market, in some manner, it is impossible to build up the capability of the domestic industry to withstand global competition. This is not protectionism but selective support to the branches of production that are capable, within a time-frame, of consolidating their position in the national market and find niches in the world market. With the powerful scientific and technological potential, highly skilled specialists, such as in the defence complex, Russia cannot and must not agree to the role of a raw material adjunct to the west in the world economy. There remains a serious problem of outflow of the Russian capital. This outflow, by the most conservative estimates, twice exceeds the size of inflow of foreign investments into Russia.

The negotiation process for Russia's joining the WTO has been completed. However, the problem of subsidies of crisis-stricken areas permitted by the WTO (for at least first five years) has a crucial dimension for Russia. The question of subsidies assumes importance owing to Russia's geographical position. Russia's climate is among the world's most severe ones. Its size makes communications difficult. Therefore, it is absolutely necessary to separate from compensatory measures the subsidies allotted to the northern regions in order to support normal living conditions, regular communications, stable work of enterprises of nationwide importance there. It is also essential for Russia to develop the trade in services. However, Russia's joining the WTO and General Agreement on Trade in Services (GATS) entails great difficulties. First, the domestic services sector is not fully provided with necessary legal facilities that could regulate this sector and meet the GATS requirements. For instance, there are so far no laws on agency in export and import transactions and on international technology transfer, outdated are the regulations on transportation, and there is no legal facility even for the space exploration sector. Second, the Russian services sector is not competitive enough to actively participate in expanding transactions.

Prabhat Patnaik's (Jawaharlal Nehru University) paper, 'On Some Theoretical Premises Underlying the Advocacy of State Intervention', raised questions about state intervention in the contemporary world. The territorial jurisdiction of the state in question has usually been taken to be coterminus with the geographical boundaries of the nation, and within this 'closed' universe the theoretical issues of what the market can achieve, whether the state needs *to intervene and how it should do so, have been debated. However, the question of state intervention in the contemporary world cannot be adequately discussed unless one keeps in mind the fact that the market we are talking about is usually the* international market, while the state is a nation-state. Eclectic propositions like 'we need both the state and the market' are sometimes advanced to bypass the liberalisation debate. In a liberalised economy, the state should continue to provide and even step up investment in infrastructure; it should continue to incur and even step up expenditure on education, health, social safety net, and on social sectors generally. To do all this however the state needs resources. But a liberalised economy necessarily restricts the ability of the state to raise resources. It cannot in such an economy raise much direct tax revenue. Since it has to compete with other countries to attract direct foreign investment it must tax foreign capital lightly. And since it has to maintain a certain inter se equity in the matter of taxing domestic as compared to foreign capital, as well as in taxing personal incomes as compared to corporate incomes, it cannot go far along the direct tax route. Likewise it cannot use indirect taxes for much revenue mobilisation since customs duties have to be cut and this also prevents any significant reliance on excise duties (if domestic producers are not to be discriminated against). And finally, it cannot raise the fiscal deficit too much since this would frighten off speculators and generate overt or covert capital flight. In short, the tasks supposedly left to the state are tasks which the very nature of the economy prevents it from carrying out. Those who are critical of the institutionalisation of a liberalised economy are often accused of merely pursuing some old-fashioned ideological agenda in defiance of the 'common sense' approach of using both the state and the market. Underlying all these positions is the belief that any arbitrary mix of state intervention and market operation is possible, that there exists no tension between the two. While this may be true of Keynesian situations, it is not true in the context of developing economies, and transitional economies, where the argument of state intervention is fundamentally different from what one usually encounters in economic theory.

One clear distinction between the transitional and the developing economies is that the former are switching over from centralised command-control regimes to systems with much greater reliance on market mechanism. Naturally, the institutions that support market operations are largely vestigial or even non-existent in *these countries. On the other hand, the latter while characterised often by conspicuous and pervasive government interventions in the marketplace, do possess a network of institutions to support market* operations. Anindya Sen and Sanjoy Basu (Indian Institute of Management, Calcutta) in their paper, 'Social Norms and Legal Systems in Developing and Transitional Economies', discussed the importance of social and cultural facets constituting a regulatory framework with popular compliance, either on moral grounds or according to a more mundane cost-benefit calculus, as an ingredient of development policy. The gains in terms of long-run economic efficiency might stumble against the short-run problems of misinterpretation and misuse of an evolving legal order by opportunistic agents. A pertinent example would be the boost provided to 'moral hazard' behaviour and speculative investment with more flexible regulations and government guarantees of deposits intended towards more efficient financial intermediation. Again, bad laws and contradictory standard business practices in developing countries may encourage eschewal of a legal system by contracting parties altogether. If a law is as exacting as Article 168 of the Russian civil code, which specifies that a transaction violating any provision of Russian law is void, then prudence dictates alternative arrangements for dispute resolution. The information search costs of transactions for courts would then be extremely high. The dangers of recrimination in public would discourage the contracting parties or disputants from availing of alternative avenues. A viable substitute for extensive legal forms relates to the formulation and implementation of legal rules based on social norms and local business practices under the broad aegis of the existing legal superstructure. The most striking features of a large number of developing countries, especially in Asia and east Europe is the presence of a collectivist social system. Interactions are characterised by high levels of personal trust and reputation among members of specific groups coupled with scepticism about general standards of morality. Hence, exchange and contract enforcement occur, generally, within a group rather than among groups, leading to the dominance of simple tractable exchanges in these communities. Because the entire system is so delicately balanced on trust, a crisis of confidence quickly assumes menacing proportions.

Oleg Maliarov's (Institute of Oriental Studies, Moscow, henceforth IOSM) paper, 'Development Policy and Administration: Indian Experience for Solving Russian Problems – Importance and Limi-

tations', reiterates: "Speaking about development policy and administration in any country we cannot escape characterising socio-economic system thereof". The dismantling of the system of state regulation of the economy and the total rejection of planning in Russia make any development effort devoid of general sense of direction, of overall development strategy, of proper co-ordination in using various regulating tools, of effective control over the state sector and over its impact upon the economy as a whole. The socio-economic course of 'reform', since 1992, has made the Russian economy a transitional one; the destructive transition to semi-colonial backward economy.

The policies of economic transition have been in part involuntary. They are partly a consequence of the conditions attached to the loans of the World Bank and the International Monetary Fund. But the 'extreme form of neo-liberalism' has met ready supporters within Russia itself – E Guidar, A Chubais and others. In fact, Guidar (director, Institute of Studies of Economic Problems of Transitional Period) has recently admitted that at the start of reform in Russia "there was no experience of the transitional economy" in the world, leading to the haphazard course of reform. The experience of India has a particular importance for Russia. Largeness of territory and population, diversity of resource endowments and economic structures of the regions and federal structure are common features of both the countries, creating some similar problems and showing some similar ways of solving them. Indian economy which was essentially a market economy even before the reform was much better prepared for the changes. Unlike in Russia, a certain basic framework of the state sector and state regulation to direct the market mechanism towards desired goals has not been dismantled Again, unlike in Russia, privatisation in India has not been so comprehensive – the core of the state sector continues to function as the base for state regulation though its sphere is being increasingly narrowed down to infrastructure. Credit and investment system, too is mainly controlled by the state allowing the latter to regulate principal financial flows in the interests of economic development, particularly of agriculture. There are certain lessons which could be drawn from Indian experience at this particular stage of the Russian economy. First, the free play of market forces cannot secure rapid modernisation and transformation of the economy at the transitional stage of its evolution. Second, there is the need to make government economic policies and laws, serving as embodiments of the programmes, straightforward. The effective operation of state regulation as well as of the market mechanism is virtually impossible without a modern comprehensive system of information easily available both to the government as well as private agents. The third major field of interest to Russia is the Indian experience in price control over basic fuels and materials such as coal, petroleum products, cement, steel, aluminium, fertilisers, which otherwise would have destabilised the general price level. The Indian experience also shows some deficiencies, drawbacks and loopholes in the implementation of price and distribution controls which certainly should be taken into account. It proves, nonetheless, the need for such controls at times of runaway inflation and scarcities as well as when even marginal shortages can lead to disproportionate distortions in prices, thereby benefiting only the more privileged sections of the population.

One of the crucial problems of ensuring the integrity of the Russian economy with the simultaneous maximum use of local resources and initiative is the optimal division of authority and financial resources within the Russian Federation, between the Federation and the constituent members thereof. The study of the Indian approaches to the centre-state economic relations may help in evolving the strategy and methods of solving this problem in Russia. The change over to the new course of reform increasing the role of the state in the economy requires corresponding changes in the laws including the constitution itself, passing new bills or amending existing laws.

Why the USSR collapsed has been and will remain for years to come a lively topic of discussion. Nirmal Kumar Chandra (Indian Institute of Management, Calcutta) in his paper, 'Fiscal Crisis in the USSR and Contemporary China', analysed the problem of government budget management subject to consumer subsidies on food and housing in the USSR. The doctrine of stable and low food prices has been a part of socialist thinking from the last century However, neither Marx nor Engels recommended extensive consumer subsidies under 'socialism' or the 'first phase of communism'. If each worker is to receive goods exactly according to the quantity and quality of his work, then subsidy for a wide set of goods seems to violate that condition. That is why Engels wrote against free housing for workers under socialism and suggested that rent should include interest on capital as well as ground rent ('The Housing Question' in K Marx and F Engels, *Selected Works*, Vol 1, Moscow, 1954). Evidently, the Soviets failed to find ways to mitigate the consequences of rising subsidies and the net result was a slackening in the rate of investment. China does not face problems of consumer subsidies or budget deficit that plagued the USSR towards the end. After 1978, the Chinese have moved away from the Soviet doctrine of stable prices at a low level for all 'essential' goods, even if it entailed rising consumer subsidies. If they avoided the mistakes of the Soviets, they may yet face a new kind of threat from what may turn out to be 'excessive' decentralisation with the prosperous regions unwilling to yield revenues in favour of the more backward areas.

Aleksandre Liouty's (Institute of Geography, Russian Academy of Sciences) paper, 'Outlying Areas of Russia: Problems and Prospects', pointed out the increased cost of transportation and lack of state price control that make the general situation in Russia more complicated. Higher cost of delivery of fuel, foodstuffs, and other goods to outlying areas put many of the outlying areas on the verge of catastrophe. The question of subsidy should take into account these aspects of the economy.

Dwelling upon the impact of liberalisation and structural adjustment package on the farm sector in India in their paper, 'Ongoing Changes in Policy Environment and Farm Sector in India: Role of Agro-Climatic Regional Planning Approach', S P Kashyap and Niti Mathur (Sardar Patel Institute of Economic and Social Research) observed that policy initiatives for the farm sector appeared to be un-coordinated and ad hoc – removal of subsidies on potassium and phosphatic fertilisers, some changes towards deregulation of interest charged by rural financial institutions, and even closure of some government sponsored non-viable financial outposts in rural areas. The paper briefly examined the debate on the role of prices as an engine of agricultural growth, the relevance of non-price factors as the farm sector integrates with global threats and opportunities, and the relevance of the agro-climatic regional planning approach that was initiated in 1988 under the aegis of Planning Commission.

H G Hanumappa (ISEC, Bangalore and Asian Development Group) drawing upon the specific experience of Karnataka in his paper, 'State Policy Initiatives and Agricultural Development: A Case Study of Karnataka', concluded that the foodgrain sector needs improved research and extension services to augment productivity. On the other hand, highly efficient agro-based sunrise industries in the areas of horticulture, floriculture and the like have

shown significant progress in both production and productivity. Under this process, while the relatively more endowed will benefit by participating in the liberalisation process, the resource poor population are likely to be left behind as their ability to compete in a free market situation is extremely limited. Hence, before resorting to any major reforms in the name of liberalisation, it is necessary to provide for a safety net to the poor and the deprived.

V G Rastyannikov (IOSM), however, maintained that the distorted mechanism of resource distribution based on unreimbursable inflow of input subsidies in agriculture, that is, those items of cost which are non-responsive to the actual market determinants, have given rise to wasteful resource consumption, and correspondingly have increased the production costs. In his paper 'The Agricultural Growth in the State Regulation Policy Practices in Agriculture: Some Comments on Indian Experience', he also pointed out that, in contrast to a number of countries in east Asia, India failed to adequately respond to the challenges imposed on her by the demographic explosion. Galina Sdassiouk (Institute of Geography, Moscow) extended the discussion to the 'Problems of Regional Integration in Transitional Economy', and made clear why India and Russia could be a common subject of study so far as the question of regional integration is concerned. The trade between different regions in Russia did not consolidate the federation. Rather it promoted polarisation. Since 1985, the USSR in many ways turned back to the situation in the 19th century. This was further elaborated by Andrei Volodin (IOSM) in 'Etatism in Russia's Economic History'.

What should be the alternative trajectory of reform? Bratischev's paper attempts an answer. First, it is necessary to create an efficient system of national economy based upon a two-sector planned market economy using methods of regulation and control including modern information technologies, indicative planning, state order through tenders, and personal training and upgrading of all production sectors and management bodies. Second, public ownership of natural resources, transport and power systems, communications and defence industry should be restored. Third, new 'rules of the game' are needed – an intelligent tax policy which would be universal, multilevel, relatively simple, and stimulating production of competitive goods. Fourth, funds should be accumulated in the State Investment Bank and three semi-state banks. Fifth, a new custom policy protecting domestic manufacturers from foreign competition is necessary. Sixth, the state must have a legally secured pricing concept. Finally, the state must recover the monopoly of foreign trade. The main point is that the alternative anti-crisis measures give decent place to everyone – the state, private and joint capital, and certainly the depositors. Glaziev's paper, in the same vein, brought to prominence the dedollarisation of the economy, and incentives for effective property management. The formal transformation of property relations as a result of mass privatisation has not been backed up by any real economic responsibility mechanism so as to ensure that the economic subjects are interested in raising economic efficiency, and the long-term development of enterprises.

The next round of Indo-Russian academic exchange of views on pressing economic issues would be held hopefully, as stated in the wrap-up session by Igor Bratischev, in a 'new Soviet Russia'.

Empowerment

Andre Beteille

Empowerment through the expansion of the civil, political and social rights of citizenship is a laborious and unexciting process. Empowerment through the class struggle was a different story altogether; but that story has now been played out and it offers hardly any new prospect. There is no doubt the prospect of empowerment through caste war; but that is something that will appeal only to those who have put their minds to sleep. So in the end, the Indian way of securing empowerment for the unempowered seems to be by the safe way of providing, as extensively as possible, quotas on the basis of community, caste and gender. But can the belief that quotas, no matter how extensive, can by themselves bring about a radical or even a perceptible redistribution of power be anything more than wishful thinking?

I
Background and Context

THE idea of empowerment has taken a hold over the minds of increasing number of persons in the last few years. It is now widely employed in the press, on television, and in political, academic and even legal circles. There is talk about the empowerment of the poor, of backward communities, of women and of various other disadvantaged sections of society. Empowerment is seen by many politicians, publicists, social activists and a growing section of the intelligentsia generally as the only effective answer to oppression, exploitation, injustice and the other maladies with which our society is beset.

The idea of empowerment contains exciting possibilities. It seems somehow to fit our present Indian reality particularly well. But in its current, widespread use, the idea is new and, as with most attractive ideas that are new, it means different things to different persons, and in some cases even to the same person. It bears the risk of being put to too many uses by too many persons to serve the requirement of systematic social analysis. At the same time, when an idea comes to be used so extensively within a society, it is the obligation of the social analyst to submit it to critical scrutiny, to examine its presuppositions and implications, its scope and its limits. What I propose to do here is to make such an examination of the idea of empowerment from the sociological point of view.

The first thing to note is that there is very little guidance available in existing social theory on the idea of empowerment as it is currently used in public discussion in India. A quick check through dictionaries, encyclopedias and glossaries of popular textbooks of sociology shows that the term itself is largely absent. In the absence of well-formulated concepts, sociologists tend to use their common sense to construct such arguments about empowerment as the occasion demands. It is difficult to construct arguments in that way that will be consistent across a range of contexts. I shall avoid the usual practice, and turn instead to cognate concepts such as power, authority and legitimacy that are already established in sociological usage so as to work towards a clearer understanding of the subject.

By and large, the scholarly discussion of empowerment has been context-driven rather than theory-driven. What is the context that brings the idea of empowerment so insistently to the attention of Indians today? In a nutshell, that context is the contradiction between a hierarchical social order and a democratic political system. To be sure, the contradiction was present and perceived even at the time of independence. But at that time it was hoped and believed that the contradiction would be inevitably eased with the transfer of power from British to Indian hands. This did not happen; and the contradiction has become, if anything, more acute, more extensive and more clearly perceived.

Indian society is a notoriously hierarchical society. It is not that nothing has changed, but the change not measured up to the expectations aroused at the time of independence. The vehement style of public discussion in India tends to obscure the changes, however limited in scope and extent, that have in fact taken place in the last 100 years.

There are substantial inequalities of income and wealth and, what is more striking, vast number of persons continue to subsist below the line of poverty in both rural and urban areas. An extensive programme of land reform sought to address some of these problems in the rural areas, but the limited gains from the programme were largely eaten up by the relentless increase of population. In the urban areas as well, income is very unequally distributed. The problems are difficult if not intractable. The experience of economic growth in most parts of the world has been that, at least in the initial phases of growth, inequalities of income and wealth tend to increase rather than decrease. Intelligent policy interventions can do something to keep economic inequalities from increasing, but not a very great deal.

The most deep-rooted forms of inequality, built into the structure of traditional Indian society, are those based on caste and on gender. Though the inequalities of caste and gender both run very deep, they also cut across each other since women as well as men are members of every caste, from the lowest to the highest, and there are men in the lowest of castes just as there are women in the highest. The disabilities due to caste and due to gender were discussed and justified most elaborately in the traditional literature of the Hindus [Sivaramayya 1984], but similar disabilities were present among other religious groups as well.

The traditional disabilities due to caste and gender were social and not just economic. Deep-rooted ideas of purity and pollution governed the social standings of different castes and sexes; men and women were deemed to be of unequal moral worth as were the different 'varnas'; and the social hierarchy was underpinned by a legal order in which privileges and disabilities were carefully modulated according to caste and gender. The law has now changed; social attitudes have also changed though to a much smaller extent. Despite the changes, women and persons of inferior caste continue to suffer from many disadvantages.

India's antiquated and ponderous social hierarchy is markedly at odds with its present political system. Democracy, according to the classic formula, is government of the people, by the people, for the people. In India today, the people are to the fore in some respects; but in the things

that really matter, they seem to have very little control of their own destinies. The experience of Indian democracy in the last 50 years has brought into sharp relief a feature of modern democracies everywhere: the gap between formal political participation and effective political control. Universal adult franchise came as a revolutionary turn in the country's history [Srinivas 1992]. But with the passage of time, much of the shine has gone from the electoral process. The ordinary people of India – rich and poor, rural and urban, brahmins and harijans, Hindus, Muslims and Christians, men and women – have by now experienced many general elections. They have voted governments into power, and they have voted them out of power. Yet the ordinary person feels that his own life has hardly been enhanced as a result; and this feeling is expressed in a magnified, not to say an exaggerated, form by reporters, columnists, social scientists and other members of the intelligentsia.

Here again, a sense of proportion and balance must be maintained. It would be true to say that what universal adult franchise has achieved has fallen far short of what was expected, but false to say that it has achieved nothing. Representative government works in complex ways. Leaders who are voted into power even in free and fair elections, once in office, rarely live up to the good faith reposed in them by their electors. One set of leaders is replaced by another, but the new leaders quickly fall into the ways of the old ones. There has undoubtedly been a change in the social composition of the political class in the last 50 years, and that class has almost certainly become more accessible to the persons on whose support its members depend. But that does not mean that there has been a great increase in the powers of ordinary persons.

The Indian Constitution was written at a turning point in the country's history. It is not merely a set of rules relating to governance, but a design for a new kind of society. The older society that had prevailed for centuries and millenia was based on the principle of hierarchy; the new society envisaged in the Constitution was to be based on the principle of equality. The equality provisions in the Constitution were not confined to political equality at election time, but sought to reach into basic social and economic matters. Similarly, the concept of justice embodied in the Constitution was a wide and capacious one.

The Constitution of India took several years to write, and it is one of the lengthiest documents of its kind. But despite the great care taken in its writing, not everything has gone well with it. *Some say that the provisions of the Constitution did not go far enough, and others that too many provisions were written into it.* Some fourscore amendments have already been made to the Constitution in its life of less than 50 years, and there are pressures from various quarters to have a comprehensive review of it. All of this has been accompanied by a growing disenchantment with what can be achieved in the cause of equality and social justice through the provisions of the Constitution. Fifty years ago people expected a very great deal from the Constitution; now increasing numbers of persons seem to expect hardly anything at all from it.

The disenchantment with the plans has been, if anything, even deeper. This is in part a worldwide phenomenon, greatly reinforced in recent years by the collapse of the Soviet Union. But the trend had set in earlier, and the Planning Commission, once Nehru's favoured child, had lost much of its aura by 1977. Economic planning still has an important part to play, but it is now widely accepted that its aims have to be more modest if it is to be effective. With the passage of time, the realisation has grown that a whole social order cannot be transformed, or transformed quickly enough, merely by having regular elections, good laws and good plans. That kind of transformation calls for something else, and it is thus that public attention has come to be focused on empowerment. Party leaders and technical experts have been tried out and they have failed; the people must now get their turn, for empowerment means above all empowerment of the people.

II
Diverse Meanings of Empowerment

Empowerment is about social transformation; it is about radical social transformation; and it is about the people – ordinary, common people, rather than politicians, experts and other socially or culturally advantaged persons. Above all, it is about power, although the concept of power contained in it is generally left unspecified. Empowerment is both a means to an end and an end in itself. The term adapts itself differently situations, and its signification is both variable and fluid.

The idea of empowerment may be invoked in virtually any context: in speaking about human rights, about basic needs, about economic security, about capacity building, about skill formation or about the conditions of a dignified social existence. It is well known that our Constitution has created many rights for all members of society, irrespective of their social or economic standing. *It is equally well known that for millions of Indians those rights exist only on paper.* Creating rights is one thing, and giving security to them is quite another. Our legislators have been prodigal in creating rights but have not paid much heed to the enforceability of those rights. Empowerment is seen as a way of addressing the problem of rights that remain unenforced.

Empowerment is also invoked in the context of economic weakness and insecurity, particularly of marginalised, unorganised and other disadvantaged groups, classes and categories. It is then seen as a condition or an aspect of capacity building. Economic deprivation is widespread in our country. It is of many different kinds and has many different sources. Some of it goes back to age-old practices and institutions and some of it is the result of the ongoing economic transition. Moreover, problems of economic viability manifest themselves differently at different levels, for example, the community, the household and the individual. A community may be doing moderately bad on the whole but particular households in it may still enjoy a high standard of life; conversely, the women members of even well-to-do households may have no economic security at all.

Where one might have said in the past that women, adivasis, or even agricultural labourers were disadvantaged, one is more likely to say today that they are unempowered. This change of language betokens a change of orientation from the economic to the political. It is not that the planners and policy-makers of the early years of independence did not know that poverty and deprivation were widely prevalent or even that they were especially concentrated in certain sections of society. But they sought more or less conventional economic remedies for these problems and hoped that they could be made to work without a radical redistribution of power. They were well aware that growth and equity did not always go hand in hand [Tendulkar 1983], but they hoped that they could somehow create a balance between the two.

The focus on empowerment has given a new emphasis to the building of economic and social capabilities among individuals, classes and communities. As one would expect, interventions of various kinds are being considered and recommended. The supply of credit on easy terms, of bullocks to impoverished farmers, of goats and poultry to tribal women – these have all been viewed at one time or another as steps towards their empowerment. Capacity building through craft training, specially for women, whether for full-time or part-

time employment, is seen in a similar light. There is finally the drive towards literacy and education where much still remains to be done despite the Directive Principle of State Policy for providing universal elementary education up to the age of 14.

Implicit in the idea of empowerment is a certain theory of social change, in particular of change from a hierarchical to an egalitarian type of society [Beteille 1983], or in a slightly different language, from an aristocratic to a democratic type of it [Tocqueville, 1956]. A hierarchical or aristocratic society is based on the privileges and disabilities of groups whose unequal placement in society is widely acknowledged by its members; a democratic society is based on the recognition of the equal rights of all the individual members of it. The passage from the one type of society to the other has been a common experience in the modern age. But even where the direction of change has been broadly the same, the pace of change and the stages through which it has taken place have differed from one case to another. The radical redistribution of power has not played the same part in it in every case.

One significant path of the transition referred to above has been through the expansion of citizenship. This happened in many western countries, but most characteristically in Britain where it has received much attention from sociologists [Bulmer and Rees 1996]. There it has been shown how equality came to be gradually realised as a social value as citizenship became the main component in the status of the individual [Lockwood 1992; see also Parsons 1965]. The point, simply, is that equality is not just a question of the redistribution of power, it is also a question of a change of values. It is here that theories of social change tend to diverge, for some theorists believe that social change comes about mainly through the redistribution of power whereas others assign at least as much importance in it to the reconstitution of values.

In a classic essay on the subject, T H Marshall (1977) identified three basic elements of citizenship: civil, political and social. The civil element, according to him, as composed of the rights necessary for individual freedom; the political element consisted of the right to participate in politics through representative institutions; and the social element comprised certain basic rights to economic welfare and social security. He argued that in Britain, the 18th century saw the emergence of civil rights, the 19th of political rights and the 20th of social rights, although he was well aware that one phase generally ran into the other.

The transition outlined above has been described by many different authors in many different ways. Different components have contributed to it at different times and different places, and they have not all been stressed to the same extent by every author. Even in Britain, where the transition was relatively smooth, political mobilisation if not political revolution played some part in the evolution of citizenship. Elsewhere in Europe, it played a more prominent if not a more profound role. But even in France, where the revolution of 1789 became a landmark and a symbol, many different factors, and not just politics contributed to the unfolding of citizenship.

There is something in the development sketched out above that has the appearance of a paradox. It is undeniable that the expansion of citizenship in the 19th century was on the whole a movement towards equality, and that is how it was experienced by many of those who lived through that period. Yet the evidence seems to be clear that the very same period witnessed an increase and not a decrease of inequality in the distribution of income [Kuznets 1955]. This indeed was the main burden of the argument of T H Marshall (and in a different form of Alfred Marshall before him), that citizenship and social class develop contrapuntally in such a manner that the one places constraints on the uniform advance of the other.

Despite all that has been gained from it, the advance of citizenship has been not only discontinuous but also time-consuming. For instance, in Britain, even after more than 200 years, one can hardly claim that 'full' or 'substantive' citizenship has been secured for ordinary members of society [Lockwood 1992:260-2]. And that takes away a very great deal from its attraction, particularly in countries that are latecomers to the field and have much ground to cover before citizenship becomes properly acknowledged as a value.

Although the equal rights of individuals as citizens is central to our legal and constitutional structure, the idea of citizenship in the sense described above is relatively new to our society and polity. Within the social order, the individual was, to an unusual degree and over a very extended period of time, subordinated to the group: joint family, caste and village. The building blocks of the social order were these groups rather than individuals conceived as autonomous moral agents. The relationship between the individual and the larger society was mediated by family, caste and community, whereas it is of the essence of the modern idea of citizenship that the relationship between the citizen and the state is an unmediated one [Beteille 1998].

To many persons, and to increasing numbers of them in India, empowerment appears as an attractive alternative to the slow and tortuous path of citizenship for dismantling the old social structure and putting a new one in its place. No matter how we assess its costs and benefits, the main point behind empowerment is that it seeks to change society through a rearrangement of power. What this might entail cannot be considered without a detailed examination of the nature of power to which we turn in the following section.

III
Concepts of Power

The concept of power has been extensively, if often loosely, used in a variety of fields ranging from electrical engineering to moral philosophy. The term certainly has a wider currency, both in popular speech and in the scholarly literature, than the term 'empowerment' which, clearly, is a derivative of it.

Before turning to the discussion of power in social theory, I would like to note that there is a certain ambivalence about it in the popular mind that frequently seeps into the scholarly literature. The ambivalence of power has been forcefully brought out in the writings of the French philosopher and historian of ideas Michel Foucault whose work has had great influence in recent years [Foucault 1980]. But although they are rich, fertile and ingenious, Foucault's arguments about power remained inconclusive. They are difficult to apply to contexts outside the ones in which they emerged, and, while noting their great originality, I will refrain from trying to use those arguments in the discussion that follows.

The ambivalence with which I am concerned is nicely expressed in Lord Acton's dictum that power tends to corrupt and absolute power corrupts absolutely. There is a pervasive tendency to think of power as something evil or at least as having an evil component, so that one can say at best that it is a necessary evil. If that is admitted to be the case, how can one account for the enthusiasm for empowerment? The fact is that those who believe that power is evil may also believe that it can be redeemed by being placed in the hands of the dispossessed and the disinherited, such as workers, peasants, tribals, untouchables or women.

The sociological conception of power may be best understood by being viewed in opposition to the anarchist and the populist conceptions of it. In the anarchist conception, power itself can be abolished and human life reconstituted in such a way that the exercise of power becomes redundant. In the populist conception, the

emphasis is not so much on the abolition of power as on its radical redistribution such that all sections of society and all members of each section participate equally in its exercise. These two closely-related conceptions of power are both animated by strong moral concerns.

Moral concerns are not absent from the sociological approach to power, but they are restrained in the interest of what can be known, from observation and experience, about human societies in different places and at different times. Observation and experience have shown that power is present in all societies and indeed we can speak of it as being constitutive of human societies as we know them. They have shown, further, that in general power tends to be unequally distributed: the equal distribution of power, where it is found, represents the limiting and not the typical case, and it is unstable. These two propositions underlie all sociological conceptions of power, no matter how different they may be in other respects.

The sociological discussion of power is now a 100 years old. Two pioneers whose ideas have greatly influenced the subject were Vilfredo Pareto and Max Weber who, it may be noted, both began their academic careers as professors of political economy. I do not need to speak here about Pareto's work on income distribution which is well known among economists. But it is worth pointing out that he wrote a trenchant critique of socialist systems [Pareto 1926] in which he argued that the belief that the abolition of property would lead to equality was a delusion since the real basis of inequality was not property but power. This view is echoed by J R Hicks (1942:190) in his brief discussion of income distribution in Britain which concludes with the following observation: "Inequality of income is the form taken in our society of a more fundamental inequality – the inequality of power". (It may be noted in parentheses that while sociologists in general acknowledge the importance of the inequality of power, they do not all believe that it is the ultimate source of every form of inequality.)

More than any other scholar, it is Max Weber who has had the largest influence on the sociological study of power to which he assigned a wide significance in every major social domain. He wrote, "Now: 'classes', 'status groups' and 'parties' are phenomena of the distribution of power within a community" [Weber 1978:927]. Weber's oft-quoted definition of power is as follows: "In general, we understand by 'power' the chance of a man or number of men to realise their own will in a social action even against the resistance of others who are participating in the action" [Weber 1978:926]. This is a very capacious conception which includes coercion, domination and manipulation [Shils 1975:239-48]. The point I wish to stress is that in this conception, a relationship of power is by its nature an asymmetrical relationship since power is something that one set of persons has over others. It may of course be that, while A has power over B in one domain, B has power over A in another, so that they can be said on balance to have equal power; but, again, such a situation would be unusual rather than typical.

The conception of power referred to above – power as that which some have over others; power as coercion, domination and manipulation – corresponds to what may be called the zero-sum approach to power. Some have power to the extent that others are without it, the more power some have, the less others have of it. The power of one party can be enhanced only by reducing the power of some other party.

In other words, empowerment and disempowerment go hand in hand: the empowerment of some sections of society has to be accompanied by the disempowerment of other sections of it.

It may be said without too much exaggeration that radical and revolutionary theories of politics are as much about disempowerment as they are about empowerment. This is certainly true of the Leninist and Maoist theories which have had great influence in large parts of the world. According to them, the rise to power of the workers and peasants would be accompanied by the fall from power of the capitalist and landed classes. The theory of the class struggle has lost some of its appeal, but it has left a certain residue in the vocabulary of radical politics in many countries. Some of the radical drive of the older variety of class politics has been taken over by the politics of backwardness, many of whose proponents appear to regard the disempowerment of the upper castes or the *savarnas* as a necessary condition for the empowerment of the scheduled tribes, the scheduled castes and the other backward classes.

Not all students of the subjects subscribe to the zero-sum conception of power. An alternative conception and approach has been proposed by the sociologist Talcott Parsons (1963). He argued that power may be viewed not simply as what some have over others, but as a resource of the community as a whole which it may use more or less effectively in the attainment of its goals. If we take a long-term view of human endeavour and achievement, then it may appear that societies have in fact expanded their capacity to act effectively in the pursuit of larger objectives. Power, in this conception, is compared to wealth, and just as the wealth of a nation may be augmented over time, so may also be its power. It is certainly conceivable that every increase in the power of some may not require a corresponding diminution in the power of others. But however, persuasive the analogy between the two may be, it has very serious limitations since power cannot be measured in the same way as wealth.

There are two further points to be made here. Even if we admit that the power of a community as a whole need not remain at the same level but may increase over time, it does not follow that the increase can be brought about according to the will and pleasure of individuals under any condition whatever. There are definite social conditions that have to be met for the increase to be possible and effective. Parsons himself would assign great importance to the simultaneous expansion of the rights of citizenship and the capacities of institutions.

The second point to be noted is that a positive-sum approach to power does not in any way entail the belief that the distribution of power can or should be made equal. Here again the analogy with wealth is useful. Changes in the wealth of a nation and in its pattern of distribution are two different things. There is no ground for believing that the equal distribution of wealth can be ensured by increasing – or decreasing – its wealth as a whole. Even if it is possible to increase a nation's capacity to attain its own goals and to say that there has been an overall increase in its power in that sense, it does not follow that that power will come to be more equally distributed.

IV
Power and Authority

I would like to return briefly to the ambivalence surrounding the idea of power. As will be evident from the preceding discussion, power is viewed as a source of corruption and evil; but it is also viewed as a prime mover in a nation's progress and advancement. This double nature of power is perhaps most acutely felt in modern democratic societies where government and opposition speak in radically different voices but are seen, when the turn comes for exercising power, to be acting in remarkably similar ways. It is this that gives to the idea of empowerment its peculiar fascination. For the hope remains that power, which is a source of so much evil, can be made into a source of everything that is good by being transferred from the wrong to the right hands, from the capitalists to the workers, from the landlords to the peasants, from the upper to the lower castes, and, now, from men to women.

As we have noted already, power may be exercised in a variety of forms, such as coercion, domination and manipulation. Here I shall be concerned not so much with the contrast between the evil and the good aspects of power as with that between untamed power and power that has been tamed or institutionalised. Central to the entire subject of political sociology is the distinction, that we owe principally to Max Weber, between power and authority, or between power and legitimate domination. Important though the distinction is, it has proved to be one of the most difficult distinctions to apply consistently in political analysis. But once we admit the value of the distinction, we cannot escape the question as to what the project of empowerment will entail not just for the distribution of power as such but, more specifically, for structures of authority in the major institutions of society.

At the heart of Weber's distinction lies the idea of legitimacy. The difficulty here is that while Weber has discussed in some detail the principal types of legitimacy and even the principal sources of it, there is no clear or consistent definition in his writing of legitimacy itself. 'Traditional', 'rational-legal' and 'charismatic' domination are ideal types of domination; they are not average types; they refer to differences in kinds of legitimacy, not degrees of it. It is difficult in the nature of the case to provide a test for determining whether a given system of domination is or is not legitimate, or to what degree it is legitimate. The most that we seem to be able to say is that a system is legitimate because it is accepted as legitimate; as to whether it should or even will continue to enjoy its legitimacy, nothing very much can really be said.

Coercion and manipulation as forms of power are no doubt important features of the real world. But no political order can be sustained for long unless it is acknowledged, more or less widely and more or less actively, as being right, proper and desirable. Broadly speaking, this is as true of monarchies and aristocracies as it is of republics and democracies. Political regimes have come up from time to time that have sought to maintain themselves mainly through coercion and manipulation, but they have not been stable. The concept of legitimacy draws attention to the fact that the stability of a regime requires that the exercise of power be sustained by the values commonly held by the members of society. The stability of a regime is affected not only by conflicts of interests, but also by conflicts of values.

It will be generally agreed that all political regimes enjoy some legitimacy. But there is much variation in the degrees and types of legitimacy. For those viewing a political regime from within, the first question is of the degree of legitimacy it enjoys. As we have seen, every system enjoys dome degree of legitimacy, because otherwise it would not last; and it is hard to imagine a system that enjoys full and complete legitimacy, because such a system would never change. Beyond this, it is very difficult to make exact comparisons between systems in terms of their degrees of legitimacy. Nevertheless, the discussion of the ideal types of legitimate domination has been very fruitful since it has brought out the connections between the organisation of authority and the system of values by which type of organisation is characteristically sustained.

As we have seen, domination as a form of power has to be distinguished from both coercion and manipulation. Weber saw quite clearly that the forms of domination are themselves almost infinitely variable. He dwelt especially on two of them, and on their contrasting natures. They are, in his own words, "domination by virtue of a constellation of interests (in particular: by virtue of a position of monopoly), and domination by virtue of authority, i e, power to command and duty to obey" [Weber 1978:943]. We may, for short, refer to the first as 'economic domination' and to the second as 'legitimate authority'.

Economic dominance has a general and pervasive significance in society. It is not illegitimate in the sense that coercion mostly is from the legal point of view and manipulation from the moral point of view; at the same time, it does not enjoy quite the same kind of legitimacy as the exercise of institutional authority does. It is undeniable that the manufacturer, the moneylender and the landowner are generally able to impose their will on the job-seeker, the credit-seeker and the land-seeker. Their power is different from that of the gangster or the schemer; nevertheless, it is not quite the same as that of the official, elected or appointed according to established procedures.

A great deal of the argument for empowerment is addressed to the issue of economic domination that is neither patently illegitimate (like brute force) nor clearly legitimate (like the authority of the public official). Shifts in the balance of economic power between classes, between communities, and between men and women have been taking place throughout the world in the last 100 years. These shifts operate in many different ways, both visible and invisible, but they rarely if ever lead to the empowerment or disempowerment of any major class or section of society as a whole.

The simple definition of authority as power backed – or restrained – by legitimacy is in need of some elaboration. What is at issue here is not simply legitimacy but also a regular and continuos chain of command and obedience. The two aspects are analytically distinct, but they are functionally related. Where power flows openly and continuously along pre-existing channels, its legitimacy comes to be generally acknowledged; and it is unlikely to be acknowledged as legitimate if its flow is sporadic, irregular and concealed. Economic power acts in a different way from legitimate authority. No matter how much power the moneylender has over credit-seekers, his power is not sustained by a continuous chain of command and obedience.

The exercise of legitimate authority, as against many other forms of power not all of which are illegitimate, takes place in conformity with acknowledged rules. The legitimacy of authority is in large part the legitimacy ot the rules in conformity with which it has to be exercised. These rules provided at best a broad framework within which the exercise of authority must be confined. They cannot predetermine the correct course of action for a given authority in anticipation of every possible situation. Were that to be the case, the authority concerned would act simply as an automation without any power to decide between alternative courses of action.

The capacity to decide between alternative courses of action is vested in some social positions and not in others, or more in some than in other positions. We may speak of the power associated with such positions, or, when they operate within an acknowledged framework of rules, of the authority vested in them. What I wish to stress here is that although the exercise of authority is in many ways different from the exercise of other forms of power, it is nevertheless at bottom a form of power. It is for this reason that we cannot speak of empowerment without taking into account the structures of authority in a society.

If the exercise of authority is associated with continuous chains of command and obedience, it is seen most clearly in the various types of associations that are a feature of every type of society except, perhaps, the most primitive bands of food gatherers. Here I use the term 'association' in a very broad sense to include every kind of institution and organisation with a corporate identity that is recognised by both members and non-members. Examples of these would be schools, colleges, universities, hospitals, the Reserve Bank of India, the National Physical Laboratory, the Times of India and many others. Each is a field for the exercise of authority which is distributed in a more or less determinate way among its members according to the positions they occupy in it.

A school as an institution has a certain corporate identity and a certain division of labour. Its activities are co-ordinated in various ways among which the exercise of authority by some over others is a significant one. When the institution functions effectively, the authority does not have to be exercised with a heavy hand. But no institution in the real world functions smoothly enough for it to be able to dispense with the exercise of authority by some over others; not even communes and 'ashrams' are exceptions to this rule. Most persons would acknowledge that masters have to be given some authority over pupils and the headmaster over the other masters if a school is to attain its goals. But even this may be challenged, as was done on a large scale during the great cultural revolution in China and sporadically during the naxalite movement in India.

A bank is a very different kind of institution from a school. Its internal division of labour is a division of labour among adults. It is a part of this division of labour that authority is unequally distributed so that some can take decisions that will be binding on the others. A bank would hardly be able to serve its customers if nobody had the authority to take such decisions or if that authority were randomly distributed among its employees. I have been the victim of a local branch of a nationalised bank where such is sometimes the situation. But I doubt that even the most radical proponents of power-sharing will ordinarily recommend that the State Bank of India be run on anarchistic principles.

I can multiply examples from many different domains, but that will not be necessary. I have said enough to show that a certain amount of imperative co-ordination, i e, co-ordination through the exercise of legitimate authority is essential to the proper functioning of virtually every kind of institution, organisation and association. The generic term proposed for these is 'imperatively co-ordinated association' which is a somewhat clumsy English translation of the term 'Herrschaftsverband' used by Max Weber [Dahrendorf 1959:167]. Their significance has been viewed differently by different persons. Some have regarded them as obstacles to the empowerment of the people, whereas others would maintain that it is through their differentiation and expansion that the reservoir of power at the disposal of the nation as a whole and its individual citizens is augmented.

V

Redistribution of Power and Social Rearrangement

The distribution of power is not a separate or detachable part of society but permeates every type or arrangement in it. Any major alteration in the distribution of power is bound to have both direct and indirect, foreseeable and unforeseeable, consequences running through society as a whole.

Society may be likened to a mosaic of many different components. Even that would be too simple an analogy, for the components differ widely in form and dimension; they are interpenetrating rather than mutually exclusive; and they continually change their aspect.

A large and complex society such as ours cannot be thought to be made up simply of individuals (or citizens) at one extreme and the nation (or the state) at the other. When we think of the redistribution of power, of empowerment and disempowerment, we cannot think only of India and 950 million Indians. We must think also of everything that stands in between – the varieties of communities, classes and categories; of associations, organisations and institutions; and of the many networks of relations that link the individual members of society to each other and to society as a whole. Because, changes in the distribution of power affect all of these in one way or another.

Our society is divided, first of all, into classes and communities, and their economic and political significance is widely recognised. An Indian is not simply an Indian; he is a peasant, a worker, a manufacturer, a trader or a moneylender. As such, he is linked to others of his own class and of other classes through a variety of ties. These ties are of great significance not only to his membership of his own class but also to his identity as an Indian. By far the most persuasive theories of empowerment and disempowerment in the last 100 years have taken their point of departure in the division of society into classes. Changes in the balance of power between classes have taken place throughout those years, but those changes have been very different from what had been anticipated by those who maintained that a revolutionary transformation of society would be the inevitable outcome of the class struggle. Class divisions are important; but other divisions are sometimes even more important.

Distinct from class are identities of community based on language, religion, sect, caste and tribe. Language is not just a vehicle of thought and speech, it is also a basis of social identity. It unites those who are of the same tongue and at the same time divides those who are of different tongues. The same is the case with religion; socially and politically, it unites as well as divides members of the same nation. Then, of course, there is caste which was the basis of the social hierarchy in the past. While it has lost many of its religious functions, it has acquired new political functions; it is very much in the forefront of the discourse on empowerment today.

Where the politics of identity is concerned, language, religion, sect and tribe act in ways similar to that of caste. Indeed, the same term 'jat' or 'jati' is used for all of them in many parts of the country in the context of social and political identity [Beteille 1996a]. Today, the politics of backwardness has spread from castes to communities of other kinds. It is not simply the backward castes – the yadavas, the kurmis, the kolis and the many others – who want more power for themselves, but also the religious and linguistic minorities. Each community looks at itself and finds that it is disadvantaged in some way, and its leaders stake a claim for more power on its behalf; in this way, its social identity is reinforced and at the same time its bargaining power is enhanced.

Different from the identities of class and community are those based on gender. The division between men and women is the most general if not the most fundamental of all social divisions, and it is found in all societies from the simplest to the most complex, from the most backward to the most advanced. While the divisions of class and community cut across each other to a greater or lesser extent, those of gender necessarily cut across the divisions of both caste and class since men as well as women are to be found in every class and every community. While it may be said, with some degree of plausibility, that there is in fact a great deal of overlap at the bottom of the ladder between the economically disadvantaged classes and the socially backward castes, it cannot be said at all that there is a similar overlap between women as the more disadvantaged sex and either the lowest classes or the lowest castes.

Class, community and gender are important components of the social mosaic; but they are not its only components. There are, in addition, a multitude of institutions performing a variety of specialised functions in administration, finance, education, research, communication, and so on. These institutions - the secretariat, the bank, the school, the laboratory and the newspaper – also serve to link individuals to each other and to the wider society. They have a very different place in society from the place occupied by caste, community and gender; they function in a different way.

Institutions performing specialised functions have grown enormously in our country in the last 100 years. Not all of them are working well or are in a state of good health. Many of them are manifestly corrupt, inefficient and inflexible. There is intermittent talk that these institutions are foreign implants of Indian soil, that they are 'elitist' in character, they are doomed to be ineffective, and that they should be replaced by alternatives more in tune with the traditions and the aspirations of the Indian people. But such talk is really without issue. The growth of functionally specialised institutions and their differentiation is an inescapable part of the modernisation process, and we cannot opt out of the modern world any more than we can jump out of our own skins.

While I am inclined to stress the increasing importance in our society of open and secular institutions [Beteille 1996b], the contemporary discussion of empowerment tends to overlook the requirements of these institutions and, sometimes, their very existence. The object of attention in such discussion is either the people as a whole – the 'people' as against the 'elite' or the 'establishment' – or particular classes, communities and sections of society considered as unempowered, such as peasants, workers, backward castes, religious minorities and women. The question is never addressed in any detail as to whether, and to what extent, the empowerment of peasants, workers, backward castes, religious minorities and women will affect the functioning of the institutions on which the well-being of society as a whole depends.

The most radical theories of empowerment are those that call for the empowerment of the people as a whole. These are populist theories and they are mistrustful of institutions as such, because they see them as obstacles to the aspirations of ordinary people – peasants, workers, students, dalits, women – to secure control over their own lives. They ignore or reject the distinction that social theories have been at pains to make between naked power and legitimate authority. They believe that the well-being of institutions is best secured by having full and equal participation by all in the conduct of their affairs. for the historically-minded, the model of such institutions is the Paris Commune of 1871, once greatly admired by Marx.

Beyond this, a great deal of the argument for empowerment relates to particular components of the social whole. But the principal, if not the sole candidates for empowerment, are classes, communities and sections of society rather than its major institutions. After all, one might call for more powers to be granted not simply to peasants, workers, backward castes or women, but also to universities, research laboratories, banks and other autonomous or semi-autonomous institutions. But that is not done or done very rarely in the name of empowerment.

It is of course tacitly acknowledged that the empowerment of disadvantaged classes, communities and sections will affect at least indirectly the major institutions of society. But what the advocates of empowerment seek to alter here is above all the social

composition of these institutions and not necessarily their mode of functioning; and their attention rests mainly on those institutions that are believed to be the major repositories of power in society.

VI
Empowerment and Distributive Shares

As one would expect, many of the proposals for empowerment are very broad and general, but others are quite specific and concrete. Among the latter are those that seek to bring about empowerment through a radical change in the social composition of the strategic institutions of society, in particular the various organs of the state. This approach to empowerment has in the last few years evoked much public discussion in India, and, in this concluding section, I will consider briefly its scope and limits, and its implications for the distribution of power and authority, the functioning of institutions and the general well-being of society.

In all traditional hierarchical societies, access to positions of authority in the public domain were restricted largely to men, and among men, to those born into particular families, castes or estates. Appointments to public office went more according to birth rather than according to the principle of careers open to talent. Men of exceptional ability might of course rise to positions of authority, but the opportunities available to them were limited, particularly in India. Democracy ushered in a new principle that made public office open to all irrespective of birth. With this the social composition of public institutions began to change in Europe and America, but very slowly at first. In Europe, even now women occupy far fewer positions of authority than men, and in the US, Blacks and Hispanics fewer than Whites. Achievement replaced ascription as the basic principle, but practice has lagged far behind principle.

When India became independent 50 years ago and adopted a republican constitution, the presence of men belonging to the higher Hindu castes was even more conspicuous in all strategic public institutions. There have been some changes in the last 50 years, but many believe that those changes have not gone far enough. They feel that there should be both men and women, and men and women from all castes and communities in those institutions for democracy to be real and effective.

assuming office that he wanted to have a cabinet that would look like America. That was not meant to be taken literally, but it did make a point. Many would like to see greater social diversity in the membership of our key public institutions than is at present found. But the diversity can be more easily accommodated in some public institutions than in others. As we have seen, the population of India is divided into a number of social classes, differing widely in income, occupation and education. These divisions are by no means unimportant; but members from all the different classes can be accommodated more easily, let us say, in the Lok Sabha than in the Supreme Court or even in the higher civil service.

It does appear odious in a democracy when the organs of public authority are all in the hands of men from a particular social background. A cabinet, a Supreme Court and a higher civil service which has women as well as men, and men and women from all castes and communities is likely to be more open and more sensitive in its approach to the larger problems of society than one whose members are all of the same background. But beyond that it is not

easy to say very much. For one can hardly say that a mere change in the social composition of an organ of authority will bring about a definite change either in the concentration of authority or in its mode of exercise. The experience of the Soviet Union does not show that when more peasants and workers secured positions in the organs of authority, those organs exercised their authority with a lighter touch. What in fact resulted was greater concentration rather than greater dispersal of authority.

Most persons now realise that in our kind of system it is not possible to give equal representation in public institutions to the various classes in society. But what cannot be done for class can in fact be done for caste. It is said, somewhat misleadingly in my view, that caste is the form taken in Indian society by class. Be that as it may, caste has this advantage over class that while it is not possible to find prsons who have the minimum qualifications for the office of judge or civil servant in the class of unskilled manual workers or of agricultural labourers, it should be possible, at least in principle, to find such persons among even the lowest of castes. The rest can be done by a comprehensive system of quotas. In this way, the burden of empowerment comes to be placed on the system of quotas; it is a very heavy burden for such a system to bear.

Whatever may be the benefits to be gained from a comprehensive system of quotas, it cannot be argued that such a system will have no social costs whatsoever. The Constituent Assembly in fact took an ambivalent attitude towards numerical quotas, admitting the need for them, but only in very special cases and for a limited period of time. After all, it had adopted strong provisions for equal opportunities for all, and creating additional provisions for special opportunities for some was bound to put strains on the former. Ambedkar himself, while advocating special provisions for the specially disadvantaged, had argued that those provisions should not be made so extensive as to eat up the general provision of equality of opportunity for all.

It was hoped at the time of independence that the special provisions would not be needed for very long and that they would gradually be pared down as the country advanced economically and politically. What has happened is the opposite. There has been some economic and political advance no doubt; but the pressure for more comprehensive quotas in the interest of equality and social justice has grown relentlessly. An initial move in the 1950s to have quotas in employment for the OBC in addition to those for the SCs and STs was aborted; but what was aborted in the 50s came to be adopted in the 90s. The committee on the status of women had in the 70s recommended against the adoption of quotas for women in parliament and in the state assemblies; but there is now the Women's Reservation Bill waiting to be made into law.

The distribution of benefits and burdens according to community, caste and gender is fundamentally at odds with the idea of citizenship on which our Constitution rests. The rights of citizenship are rights vested in individuals irrespective of race, caste, creed, sex or place of birth. It is one thing to acknowledge that benefits and burdens are in fact distributed unequally among castes and communities and between men and women. It is quite another to give legal and moral support to policies that assign precedence in the name of social justice to community, caste and gender over the individual as citizen. Special provisions may no doubt be made for the benefit of severely stigmatised or marginalised groups; but they should be restricted and not pervasive, and their costs to individuals as citizens should not be ignored.

I have earlier referred to the part played by the enlargement of the rights and capacities of citizenship in the transformation of society in the west. Many have argued that it was citizenship that acted as the main force for equality by moderating the inequalities of class (and of gender). When India adopted a new Constitution soon after independence, many had hoped that here too citizenship would be the engine of progress. But they now seem to be shifting their attention from citizenship to quotas based on community, caste and gender as the main force for social transformation. These are two different paths to the future, and it is doubtful that we can continue for long to move along both these paths at the same time.

Empowerment through the expansion of the civic, political and social rights of citizenship is a laborious and unexciting process; it is, in Max Weber's famous phrase, "a slow boring of hard boards". Empowerment through the class struggle was a different story altogether; but that story has now been played out and it offers hardly any new prospect. There is no doubt the prospect of empowerment through caste war; but that is something that will appeal only to those who have put their minds to sleep. So in the end, the Indian way of securing empowerment for the unempowered seems to be by the safe way of providing, as extensively as possible, quotas on the basis of community, caste and gender.

If what I have said above holds true, quotas, no matter how extensive, can at best touch only the upper fringes of the redistribution of power in a society as large and complex as ours. The belief that they can by themselves bring about a radical or even a perceptible redistribution of power is no more than wishful thinking. Such wishful thinking is not without its cost. The cost will be to the Constitution of India which assigns rights and capacities to citizens as individuals, and not to castes and communities or to men and women separately.

[This is the text of the D T Lakdawala Memorial Lecture delivered at Rajkot on February 20, 1999. I am grateful to I G Patel, Pravin Visaria and V N Kothari for inviting me to deliver the lecture. I am also grateful to the authorities of the Gujarat Economic Association for their kindness and courtesy during my stay at Rajkot.]

Brave New World of Global Commerce

Aditya Bhattacharjea

Developing Countries and the Multilateral Trading System: From the GATT to the Uruguay Round and the Future by T N Srinivasan; Oxford University Press, Delhi, 1998; pp 140, Rs 395.

THIS slim and readable monograph covers a lot of ground. Within its 125 pages of text, the author surveys the history of the GATT from its origins after the second world war to the signing of the Final Act resulting from the Uruguay Round Agreements (URA) in 1994; critically assesses the likely impact of the URA, and also possible future developments in the areas of environmental and labour standards and regional trade agreements; and offers agendas for complementary domestic policies and co-operation amongst multilateral economic institutions. A lengthy postscript brings the story and the assessments up to early 1997.

It might be useful to begin by spelling out what this book is not. It is not a work of original research: Srinivasan draws extensively from earlier work on the subject, including his own, but repackages it for a wider audience, although familiarity with basic trade theory is assumed. Nor does this book, which originated in a paper commissioned by the Economic Development Institute of the World Bank, pay much attention to the Indian economy. There are stray references to the Indian position in the various rounds of negotiations in the historical chapters, and – by way of illustration – to the country's involvement in recent trade and investment disputes. The focus is on developing countries in general: their involvement (or lack of it) in the evolution of the GATT, how the multilateral agreements have affected them, and what they should do in future negotiations as well as in their domestic policy formulation. There is an implicit agenda for India in these prescriptions, but the author could have added another postscript to this edition specifically for an Indian readership.

Although developing countries comprised a majority of the GATT contracting parties from the very beginning, they were suspicious of the developed countries' designs and did not participate effectively in successive negotiating rounds until the Tokyo Round. Before Uruguay, their main concern was to secure 'differential and more favourable treatment', whereby they were not required to reciprocate the developed countries' tariff reductions and instead obtained trade preferences from them, and also retained their right to impose quantitative restrictions on trade. According to Srinivasan, this attitude was (mis)guided by ideological concerns and proved doubly self-destructive for the developing countries: it permitted them to continue with costly import-substitution strategies, and also allowed developed countries to get away with GATT-inconsistent import restrictions (e g, on textiles) as well as higher tariffs on products of export interest to developing countries. Fuller engagement, he believes, would have secured them a better deal in developed-country markets in exchange for opening up their own, which would have been in their own interest in any case.

To anyone familiar with Srinivasan's writings, his support for trade liberalisation will come as no surprise. It survives despite his survey of various quantitative assessments of the gains from the URA, which shows them to be, in his own words, "extremely modest", with most developing countries gaining less than 2 per cent of GDP, and sub-Saharan Africa actually losing. He tries to put a gloss on these findings with a bizarre comparison: "even a gain of, for example, 0.7 per cent of GDP...for the world [as shown by one study] compares favourably with the as yet unachieved and unlikely to ever be achieved target for external assistance of 0.7 per cent of GDP for developed countries"! Even these modest estimates are based on the URA not being undone by resource to anti-dumping and other measures, about which Srinivasan himself expresses concern at various points in the book. He is under no illusion about the political economy of protection in developed countries, and their ability to exercise unequal power in a nominally rule-governed system. His postscript in particular points to various disquieting post-1994 developments, in particular the increasing use of anti-dumping duties by both developed and developing countries (which has in fact accelerated since his manuscript was completed in 1997), and also statements periodically emanating from the US, affirming its right to act unilaterally and to ignore the rulings of the WTO's Dispute Settlements Bodies.

Although he is careful to nuance his optimistic assessment of the URA with such warnings, Srinivasan's summary of specific market-access concessions leaves out some of the clever devices that have been used to dilute their effectiveness. For example, by 1998 developed countries should have abolished quotas on a third of their imports of textiles and clothing in the first two stages of the four-stage phase-out of the multi-fibre arrangement (MFA). Srinivasan mentions that only one quota was actually abolished in the first stage (1995), but not the stratagem that was used, which has enabled almost all quotas to survive even after the second stage (1998). This was the simple expedient of including in the one-third requirement products that were not under quota restriction to begin with. Similarly, he does not mention the considerable body of research which shows how evidence in anti-dumping cases is often slanted against exporters, and how petitions are often filed, not necessarily in order to obtain anti-dumping duties, but to threaten exporters with long and costly legal battles in Washington, Brussels and Geneva. The best that can be said about the URA is that, despite fraying at the edges in this manner, they have not unravelled entirely as country after country has slid into recession and balance of payments crisis in the last two years. There has not been a repeat of the tariff wars of the 1930s, although this is largely due to the 'hegemonic stability' provided by the robust health of the American economy rather than universal acceptance of a rule-governed international order.

On other issues, too, Srinivasan presents a mixed picture but remains sanguine. He acknowledges that stronger patent protection as a result of the TRIPS agreement will transfer rents on technology from developing to developed countries, but opines that this is likely to be offset by

more rapid accumulation of "knowledge capital", since "with spillover effects, knowledge created anywhere has potentially beneficial effects everywhere". In services, agreements on telecommunications and information technology products were concluded just in time to be welcomed in his postscript, although he notes that developed countries have been much less enthusiastic about opening up trade in the more labour-intensive services in which developing countries have an advantage. Even as they resist free movement of unskilled labour, developed countries are keen to obtain a multilateral agreement that would facilitate free movement of capital. Although Srinivasan takes seriously the apprehension that foreign investment can compromise national sovereignty, and that multinational firms can engage in restrictive business practices, he remains generally in favour of direct foreign investment and against TRIMS such as local-content and export obligations.

In a chapter based on his own recent work with Jagdish Bhagwati, Srinivasan eloquently attacks developed countries' efforts to use environmental and labour standards to justify protectionist measures. He argues for allowing a diversity of standards consistent with different levels of development. Environmental concerns can be met most efficiently by Pigouvian taxes on economic activities that have a purely domestic environmental impact, or the economist's favourite device of marketable pollution permits for activities that have transborder effects, not by restricting trade. Again, rich nations' putative concern for workers in developing countries should be translated into action by direct income transfers or by permitting free immigration, not trade restrictions to offset 'unfair' competition from countries with lower labour standards. All this echoes the old Bhagwati-Srinivasan literature on directly targeted 'first-best' policies. There are obviously more intractable practical and political problems involved here, but since Srinivasan remains acutely aware of the protectionist agenda behind the noble-sounding demands for labour standards, and (as noted above) the improbability of meeting even existing targets for external assistance, his prescriptions are presumably rhetorical debating points. Also, he somewhat casually dismisses fears that the absence of internationally enforced environmental and labour standards will promote a dangerous "race to the bottom" amongst countries trying to maintain competitiveness and attract footloose foreign capital. He indicates that he has spelt out the grounds for such dismissal in research published elsewhere, but this book could have been more forthcoming on such an important issue.

Overall, despite sketching a chiaroscuro portrait of the post-URA world trading system, Srinivasan remains an ardent advocate of trade liberalisation by developing countries. He is sceptical about preferential trade agreements as a halfway measure, because they entail complicated rules of origin and the possibility of trade diversion (here, as elsewhere, the reader's familiarity with the relevant theoretical framework is assumed). Instead, recognising that individual developing countries may find it difficult to go it alone in taking the medicine he prescribes, he suggests co-ordinated but non-discriminatory liberalisation by regional groups of countries. But this begs question: why should jumping into the deep end holding hands be more politically feasible than jumping unilaterally?

Distributional Issues Ignored

I would like to devote the rest of this review to some of the book's inconsistencies and silences on the wider consequences of liberalisation. The analytical approach on which Srinivasan has built his reputation invokes lump sum taxes and transfers to enable considerations of allocative efficiency to be divorced from income distribution. In this volume, however, he displays a certain inconsistency. For example, as indicated earlier, he attacks the case for labour standards by calling for developed countries to make income transfers to workers in developing countries. But in arguing his case against customs unions, he dismisses (on grounds of lack of information and incentive-compatibility problems) the feasibility of the international transfers that are needed to establish theoretically that a customs union is always globally Pareto-optimal. When it comes to domestic income redistribution, which is equally necessary to establish the Pareto-optimality of free trade for a single country, he is silent. Again, he is concerned that the costs of protecting the environment be shared equitably between countries, but not that the costs of trade liberalisation be shared equitably within countries

The book does cite a rueful statement by a former managing director of the World Bank to the effect that the Bank "under-estimated the political difficulty of adjustment [and] the fact that structural adjustment means a major redistribution of economic power and hence of political power". But in Srinivasan's view, it is the owners of capital, bureaucrats and politicians who lose from liberalisation in developing countries and therefore constitute the political opposition, while workers gain. There is no scope for workers (apart from a small labour aristocracy) to suffer income losses and unemployment in this Stolper-Samuelson fable, because a flexible labour market is assumed to reallocate displaced labour to expanding, labour-intensive, export sectors. Indeed, in the chapter on complementary domestic policies, Srinivasan highlights the need for reforming labour and bankruptcy laws to facilitate labour retrenchment and industrial closures. But this benign view of structural adjustment is not "a fable agreed upon".

Prescribing liberalisation even-handedly for all countries, the book ignores the welfare measures that were put in place even as developed countries were opening up to each other in the early rounds of GATT negotiations, or in the process of European integration. Unemployment benefits, child support, social security, public education and (except in the US) national health insurance ensured that basic needs were fulfilled independently of earnings. Vulnerable low income sectors such as agriculture and textiles were excluded from GATT disciplines for decades; even as they are being gradually integrated after the URA, developed countries have been able to cushion the impact by massive transfers to farmers and (in the EU) to depressed regions. Further, even low income consumers in developed countries obtain gains from trade in the form of cheaper imports (of food, clothing and footwear, for example), which is unlikely to be the case when imports are liberalised in poor countries. (Standard theory evades this issue by assuming homothetic preferences, so that all consumers consume all goods in the same proportion and therefore benefit from cheaper imports.)

Even amongst developing countries, the east Asian miracle is hailed in this book for its 'outward oriented' (which does not always mean 'liberalised') trade strategy, but not for policies such as land reforms in China, Korea and Taiwan, public housing in Singapore and Hong Kong and affirmative action in Malaysia. The absence

of such interventions in Indonesia and Thailand made them exceptions to the pattern of egalitarian growth that constituted the real east Asian 'miracle', but even they shared the other miracle economies' early commitment to providing basic education, and already had far higher literacy and teacher/pupil ratios in the early 1970s than India has today. To harp on this is not merely to call for putting a human face on liberalisation; the importance of such measures for productivity-enhancing human capital accumulation is part of the discourse of mainstream economics. Without them, trade liberalisation in developing countries is likely to result in "Modest benefits, but problems with productivity growth, macro prices, and income distribution", to quote the title of a recent paper by Ocampo and Taylor (*Economic Journal*, September 1998) which summarises the evidence. It is not as though Srinivasan confines himself to international economics or espouses laissez-faire in this book. His chapter on domestic institutional innovations and reforms calls for regulation of banks and financial markets to accompany financial sector liberalisation, monopoly regulation to accompany privatisation, and control of restrictive business practices to accompany liberalisation of foreign direct investment. By contrast, his silence on distributional and human capital issues is almost deafening.

In support of his case for free labour migration and against the developed countries' stance on labour standards, Srinivasan at one point quotes John Rawls' endorsement of freedom of movement as an essential primary good. But Rawlsian criteria, if consistently applied, would surely call into question the social consequences of indiscriminate liberalisation. And while one can applaud Srinivasan's repudiation of labour standards imposed by developed countries, it would be unfortunate if the countries of south Asia and sub-Saharan Africa, in pursuit of flexibility and international competitiveness, were to relax their own low standards regarding gender equality, occupational health and safety, child labour and primary education. They would then be competing, not for global market shares and foreign investment, but in a 'race to the bottom' of the world table in terms of human development indicators.

Tibet under Communist Rule

Dawa Norbu

The Dragon in the Land of Snows: A History of Modern Tibet since 1947 by T sering Shakya; Pimlico, London, 1999; distributed by Rupa and Company, Rs 395.

WHEN Melvyn Goldstein published his widely-acclaimed *A History of Modern Tibet, 1913-1951* in 1989, T sering Shakya was quite young but still very excited and inspired by that publication event. He at once started working on a sequel to Goldstein's path-breaking book. The result is this massive (574 pages) and impressive volume under review. Goldstein's study covers the period from 1913 to 1951, and Shakya's from 1947 to 1998, and the latter is a worthy sequel to the former by almost any standard. I believe these two volumes constitute the most serious and comprehensive academic contributions to the history of modern Tibet, covering the modern period, as they do, from 1913 to 1998, using primary sources to the extent possible.

Between these two monumental works, there has been a plethora of popular books on Tibet responding largely to international market demands. Of these Tom Grunfeld's *The Making of Modern Tibet* is the most well known. However, since Grunfeld knows neither Chinese nor Tibetan, his information on the making of modern Tibet is essentially limited to secondary sources. Moreover he seems to harbour a hidden ideological agenda as evident throughout the text on essential points. His academic sophistication hides his subtle tilt towards Chinese Communist essence on the history of modern Tibet, and this makes the book acceptable to a lot of readers.

By contrast, T sering Shakya's *The Dragon in the Land of Snows* is the most balanced and the best informed historical account of Tibet under Communist domination we have had so far. It is a difficult feat in which the author has succeeded. The Communist period he covers is extremely controversial; yet he has succeeded in maintaining his balance and historical objectivity. Above all no other book o contemporary Tibet has exhausted all th existing and diverse sources of informa tion and available data as this volume ha done. Therefore, its empirical base is soli and sound.

Drawing on a wealth of archival and ora sources, T sering Shakya reveals for th first time the full story of the Dalai Lama' escape from Tibet in 1950. He provide the first complete account of CIA involve ment in Tibet; of how the British govern ment misled the United Nations; of th internal power struggles during the Cul tural Revolution; of the previously secre uprisings against the Chinese; of negotia tions between the Dalai Lama and th Chinese government; and of the changin phases of the Communist policy and prac tice in Tibet during the last 39 years. Hi historical details are rich and treatment o the subject professional.

On the whole, the best part of the boo is the early chapters (2-6), where most o the prerequisites for sound historical re search are present, namely, various archi val records and time perspective. How ever, as we near the more recent event covered by chapters 13 to 15, the descrip tions become thin because sources narrow down to one or two, and the historian i too close to the events. This, however, i a general problem in the writing of curren history which is a typically America concept. No current history can be defini tive not only because the subject matte is still in a process of formation an contestation but also because the historia is too close to the events he describes o seeks to analyse so that the critical dis tance and long 'duree' perspective s essential for any sound historical researc become problematic. This is a proble almost every modern historian faces an T sering Shakya is no exception. Never theless, one is grateful to T sering Wangd Shakya for his important and substantia contribution to the study of 20th centur Tibetan history. It will remain a standar work on post-1950 Tibet for a long tim to come.

Globalisation and Threat to Seed Security

Case of Transgenic Cotton Trials in India

Vandana Shiva
Ashok Emani
Afsar H Jafri

There are high social and ecological costs linked to globalisation of non-sustainable agriculture which have been experienced in all commercially-grown and chemically-farmed crops in all regions. While the benefits of globalisation go to the seeds and chemical corporations through expanding markets, the cost and risks are exclusively born by the small farmers and landless peasants. While the commercial private seed supply system needs strong state regulation, farmer seed supply should function free of state interference with strong community control and public participation. Strong biosafety regulation with public participation is both a democratic and an ecological imperative.

The use of cotton as a source of textile extends far into the past, thousands of years before the birth of Christ. Documentation establishes that the cotton fibre was being produced in the Indus Valley around 3000 BC. India later became the first important exporter of the finished products. Grithasamad, a vedic rishi, survived some 20,000 years ago in a village called Kalambh in the present Yavatmal district in Maharashtra state. This village has witnessed worlds' first successful researched cultivation of cotton by Grithasamad. This cotton could withstand heavy waters and people have named it as Garthasamadam. It is questioned whether this is the same Gossipium?

– Translated from *Ved Chintan*, Vol 2, by Vinobha, pp164-65.

I
Introduction

THE Indian seed industry is rapidly moving into a phase of 'corporate control over seeds' with the introduction of transgenic crops. The biotechnological innovations in the Indian context rely heavily on the technologies and investments of the first world. Development in these areas proceed either through transnational companies setting up their branches or through marriage of convenience between western biotechnology firms and national seed companies. Under this latter scenario, the western collaborator provides technological expertise and investment, while the national counterpart provides the Indian germplasm and a marketing base. Having developed a high level acceptance of hybrid seed, corporate strategists think acceptance of genetically engineered crops will be far easier. Therefore last year, Monsanto entered into an exclusive agreement with Maharashtra Hybrid Seeds Company (Mahyco) and formed a joint venture, to introduce genetically modified *Bacillus thuringiensis (Bt)* cotton in India. As Jack Kennedy of Monsanto has stated " we propose to penetrate in the Indian agriculture sector in a big way. Mahyco is a good vehicle." This venture has been established with all hope that genetically modified cotton will account for entire sales of hybrid cotton seed within a timespan of 7-10 years. This exclusive agreement between the two would require the approval of Mahyco if Monsanto's technology were to be made available to other Indian seed companies.

However, the Indian seed industry is entering into a new phase of development without understanding and assimilating the inherent adverse impacts of genetically modified crops. Full impact of trials of genetically modified organism will only be evident in an ecological and economic study of the environment in which these trials are performed.

Evidence from the green revolution does not leave any doubt that the spread of modern varieties has been an important cause of genetic erosion. The uniformity caused by increasing areas sown to a limited number of varieties is a source of increased risk for farmers, as varieties may become vulnerable to disease and pest attack [Robinson 1996]. The trend, which is being set by the transnational companies through use of genetically engineered plants, is to create a niche for broad international market for a single product, thus creating the conditions for genetic uniformity in rural landscapes. In addition, patent protection and intellectual property rights imposed through the Trade Related Intellectual Property Rights (TRIPs) agreement of WTO will inhibit farmers from re-using, sharing and storing seeds. This increases the prospect that a few varieties will dominate the seed market. Already with monoculture development of crops, agriculture is increasingly threatened by plant diseases, insect pests and weeds. To add to this the introduction of genetically modified crops and intensively managed farms will accelerate the erosion of rich genetic diversity that we own. There is no reason to believe that resistance to transgenic crops will not evolve among insects, weeds and pathogens as it has happened with pesticides. No matter what resistance management strategies will be used, pests will adapt and overcome the agronomic constraints.

The tragedy of farmers committing suicides for a couple of years in some states, highlights some of these high social and ecological costs which are linked to globalisation of non-sustainable agriculture and which are not restricted to the cotton growing areas of various state but have been experienced in all commercially-grown and chemically-farmed crops in all regions. While the benefits of globalisation go to the seeds and chemical corporations through expanding markets, the cost and risks are exclusively born by the small farmers and landless peasants.

Privatisation of the seed sector has induced three major changes in agriculture. Firstly, it has led to change in cropping pattern of farmers' varieties from mixed cultivation based on internal inputs to monoculture of hybrids based on external inputs. Secondly, it has changed the culture of agriculture. Instead of growing food and maximising ecological security and food security, farmers have been induced to grow cash crops for high profits, without assessment of risks, costs and vulnerability. Thirdly, the shift from a public system approach to a private sector approach in agriculture. To add to all these, the new seed policy of the government lifted the restrictions on private sector import of foreign germplasm, enabling larger seed producers, particularly those with foreign collaborations, to access seeds from international sources [Shiva and Crompton

1998]. This has paved the way for big multinationals like Monsanto of the US, to enter our seed market, making the indigenous farmers vulnerable to the aggressive marketing onslaught of the company.

In fact, with the aim of monopolising agricultural systems in all countries, Monsanto is in the process of controlling the entire seed industry by acquiring shares in all the major national and international seed companies. By controlling seed, both through acquisitions and mergers, and through patents, Monsanto in effect is attempting to gain total control over food systems. Table 1 shows Monsanto's share in seed market.

In May 1998, Monsanto entered into a joint venture with one of India's largest seed company Mahyco and formed Mahyco-Monsanto Biotech Limited. Monsanto floated this joint venture with the intention of reaching the otherwise unreached farmers in remote villages where Mahyco has a presence. The statement of Jack Kennedy of Monsanto to penetrate the Indian agricultural sector in a big way using Mahyco as a vehicle has been proved accurate. Monsanto has acquired 26 per cent stake in Mahyco by paying nearly 24 times the paid-up value. Through this acquisition, Monsanto will get a foothold in the already established market of this company which has seed markets not only in India but also in the neighbouring countries [RFSTE 1998].

A Monsanto publication entitled *Leaders in Weed Control*, proudly states "Monsanto's tryst with India began over 20 years ago with Machete, the first rice herbicide in India, in 1975... Our commitment to Indian agriculture does not end with the latest herbicide. It begins." What Monsanto fails to mention is that what begins is war with Indian agriculture. What begins is the destruction of Indian agricultural diversity. What begins is the dependence of Indian farmers on industrialised, unsustainable techniques of the developed nations. What begins is the reduction of years of breeding and innovation to uniform monoculture systems. What begins is a commitment to remain the largest monopoly in agro-chemicals, a commitment to exploit third world farmers. What begins is the launch of a neo-imperialism of seed and food [RFSTE 1998].

The present study is an attempt to understand the corporate control over the genetically engineered crops heralding a new phase in the seed industry through globalisation of agriculture and to understand the threat posed to our seed security by probing into the case of trangenic cotton trials in India. In June 1998 Monsanto of the US, without any prior permission by the government of India, started field trials of its *Bt* cotton in 40 locations spread across nine states in India. The present paper probes into the details of the field trials of its *Bt* cotton at various sites across the length and breadth of India in all the important cotton growing regions. The study analyses the timing of plantation of trial crop, terms of trials of the company with the farmers, criteria for selection of the farmers and the fields, information dissemination on the transgenic crops among the farmers by the company, biosafety measures as practised by the company and by the farmers, comparison of the performance of *Bt* and non-*Bt* crop and ecological risks associated with the transgenic crops in the wake of the biosafety guidelines issued by the department of biotechnology. This paper has been organised into six sections. Section II deals with importance of cotton and a brief history on cotton hybrids. Section III deals with cotton failure and suicides by farmers. Section IV looks into the seed quarantine and biosafety rules with respect to seed production and supply. Section V deals at length with Monsanto's illegal and unscientific field trials in India and probes into the myths created by the company among the farmers and the public. Section VI looks into the need for strong biosafety regulations.

II
Importance of Cotton

Cotton is one of the most ancient and important cash crops. It constitutes nearly 70 per cent of the raw material for the textile industry and directly or indirectly provides huge employment in rural as well as urban sectors.

Cotton cultivated in India can be classified broadly depending upon its cultivation in three distinctly different agroclimatic zones through four different species of *Gossypium* and F-1 hybrids (Table 2). The species composition has shifted from the predominance of diploid (*Gossypium arboreum* and *Gossypium herbaceum*) till the early 1960s, to one with dominance of *Gossypium hirsutum* and tetrapolioc hybrids beyond the 1970s.

There has been significant increase in area under cotton from 7,610 thousand hectares to 9,063 thousand hectares registering a 16 per cent increase from 1960-61 to 1995-96. During this period the yield has been almost doubled from 125 kgs per hectare to 246 kgs per hectare [CICR 1997-98]. However for the last few years there has been failure of cotton crops in all the three zones. For the small and marginal farmers the failures have proved to be serious. The farmers apprehend that the failure of crops is due to supply of spurious seeds by various private seed companies across all the three zones.

Table 2: Increase in Area under Hybrids in India (1975-1998)

(Per cent)

Year	Area
1975	3
1980	11
1985	26
1990	36
1998	40

There has been significant increase in the private seed companies operating in these regions. These seed companies are not sincere in meeting the seed needs of the farmers. They are profit-driven and use advanced advertising methods to sell new seed varieties to ill-informed farmers. These seed companies are selling 'truthful' seeds without providing any sort of compensation in case the seeds fail. To add to this, multinational companies are trying to capture the entire seed market for major crops throughout the world by patenting their innovative technologies. These companies are making the farmer further handicapped by making them sign a pre-sale contract. Inherent to the contract is a strict prohibition on the farmers' age-old practice of producing their own seeds, storing, and replanting them.

History of Hybrids

In India hybrid cotton has been introduced since 1970 with the release of world's first hybrid cotton H-4 from Cotton Research Station, Surat in Gujarat. This hybrid cotton by virtue of its high yield potential and adaptability became popular among the farmers initially in Gujarat and later on in the states of Andhra Pradesh, Maharashtra, Karnataka and Madhya Pradesh. Two years after the release of H-4, the world's first interspecific hybrid between *Gossypium hirsutum* and *Gossypium barbadense* called *Varalakshmi* was released from Dharvad in Karnataka, which crossed the state and has spread in states such as Tamil Nadu, Andhra Pradesh and Maharashtra under irrigated conditions. With the success of these two hybrids, several hybrids in tetraploid cottons and a few in diploid cotton were released for commercial cultivation in major cotton growing states.

The area under hybrid cotton in India is given in Table 2. Share of different species and hybrids is given in Table 3. At present maximum area of cotton is covered by hybrids (40 per cent), followed by G *hirsutum* (36 per cent), G *arboreum* (16 per cent), and G *herbaceum* (8 per cent). The area under G *barbadense* is negligible. Among the hybrids, maximum area is covered by intra-*hirsutum* hybrids, followed by interspecific hybrids between G *hirsutum* and G *barbadense*. A very little area is covered by diploid hybrids [Singh 1999].

The central and southern zones saw successful cropping of hybrids. However these hybrids have not become popular among the farmers of north zone and less than 1 per cent area is covered by hybrid cotton in this zone. Statewide area under hybrid cotton is presented in Table 4. Hybrid cotton could not become popular in northern zone due to high cost of hybrid seeds and late maturity. Table 5 gives cotton acreage, production and productivity for the zones.

III
Cotton Failure and Farmers' Suicides

The epidemic of farmers' suicides is the real barometer of the stress under which Indian agriculture and Indian farmers have been put by globalisation of agriculture. Indebtedness and crop failure are the main reasons for farmers' suicides. Also indebtedness and crop failure are inevitable outcomes of the corporate model of industrial agriculture being introduced in India through globalisation. Agriculture driven by MNCs is capital intensive and creates heavy debt for purchase of costly internal inputs such as seeds and agri-chemicals. It is also ecologically vulnerable since it is based on monoculture of introduced varieties and on non-sustainable practices of chemically intensive farming.

The focus of cotton failure has been on the excessive use of pesticides or of spurious pesticides. However, pesticide use is intimately linked to hybrid seeds. Pesticides become necessary when crop varieties and cropping patterns are vulnerable to pest attacks. Hybrid seeds offer a promise of higher yields, but they also have higher risks of crop failure since they are more prone to pest and disease attack as illustrated by the Andhra Pradesh experience. Monocultures further increase the vulnerability to pest attacks since the same crop of the same variety planted over large areas year after year encourages pest build-ups.

Andhra Pradesh Cotton Failure

More than 300 cotton farmers have committed suicide in Andhra Pradesh in 1997-98. Cotton cultivation has been taken up in areas which were not traditionally cotton growing areas. One such region is Warangal district, which has switched over from food crops to cotton which is relatively a new crop introduced under trade liberalisation. The area under cotton in this region grew over three times in a decade. The increase in area under cotton has been due to the good returns that the farmers were getting on cotton.

However, the cotton failed due to severe pest attack. The frequent sprays and spurious quality of pesticides used made them even more ineffective. Most farmers had spent between Rs 12,000 to Rs 15,000 an acre on pesticides. The heavy investment made in purchase of agri-chemicals could not be recovered because the yield was much below the expected level and it even did not cover the input cost. The small farmers who had taken loans and material on credit were driven into debt and then to suicide.

The present agricultural season in the state of Andhra Pradesh has also seen suicides by farmers, 15 in the last two months of 1998. Bearing incessant rains and drought, working hard for the whole year and not getting a reasonable price for the produce, unable to pay back the loan obtained from private moneylenders, farmers are resorting to suicides. In the state last year around 300 farmers committed suicide. Out of these approximately 130 farmers belonged to Warangal district.

Farmers, lured by the good features of the varieties of cotton seeds of a few companies advertised in their villages, cultivated their lands with new varieties of cotton, namely, Navratan, Ajith, Parry White Gold, Bioseed. Keeping in mind the losses incurred during the past cotton crop, cotton has been cultivated with utmost care. In spite of that, the adulterated seeds have destroyed thousands of acres of cotton crop in Parakala, Regonda, Atmakuru, Geisukonda, Sangyam, Dharmasagar mandals of the district.

In the district itself, the extent of area under these varieties of cotton is around 30 thousand acres, which is spread across 200 villages in 27 mandals. It is believed that about six seed companies were successful in introducing these varieties in the villages through their field distributors.

Interestingly, the seed companies are selecting their seed distributors from the village itself. These distributors are found to be the large farmers who were well off and have a say in decision-making for a number of villagers. The films shown to the farmers have a great impact on the choice of seed. Many of the farmers were reporting that the boll size and the opened boll were very good in the films. However they could not get a single boll so far, and whatever bolls formed were shed by the plant without opening.

In Ulligedda Damera, in Atmakuru mandal of Warangal district, the whole village has planted a total of 150 acres with Navratan Ajith variety of cotton. Madarappu Ramesh, who has cultivated Navratan Ajith, informs that he has invested Rs 10,000 to Rs 11,000 per acre on his cotton crop. Of this investment nearly 70 per cent is spent on the chemicals and fertilisers. In the same village another farmer, Gudur Rajaiah has cultivated three acres of land with Navratan Ajith variety and admits that he also incurred the same cost of cultivation for the crop. His situation is worse as compared to M Ramesh as he has a debt of Rs 90,000 from the 'adti' shop at an interest rate of 36 to 48 per cent.

All of them learnt of this variety of seed from TV film (video film) shown to them in their village. And almost all the farmers have debts either at the 'adti' shops or with the landowners.

In another village Pallarigudda in Sangyam mandal of Warangal district, almost all the farmers of this village have cultivated their fields with Parry White Gold (PWG). The standing crop is very robust but without any bolls on the plants. The distributor of PWG seeds is from the village itself and he is not convinced that the yield is not there. About 150 villagers have taken their cases in the district consumer redressal forum at Warangal against the failure of PWG and demanded appropriate compensation for them by the company. Government officials visited the fields of farmers whose cotton crops have failed.

In addition to the seed failure, in many mandals yellow-insect pest of cotton has destroyed the entire standing crops. The farmers reported that the agriculture department of the state has shown total negligence in disseminating the advice of scientists and this has resulted in the havoc caused by the pest. Added to this, the farmers, persuaded by the suggestions given by the pesticide shopkeepers, have used high-cost but inferior chemicals, which could not reduce the pests attack on the cotton crop. Also the rate for cotton per quintal is not more than Rs 1,500 which is not commensurate with the investment made on the crop. The same pesticides, though, did kill the farmers. Table 6 gives details of farmers who committed suicides.

Through discussions with various seed and pesticide merchants at Warangal, it is revealed that the seed companies provide a very high margin on their products and also they do not demand immediate payment through cash. About 80 per cent of the transactions are on credit basis. They get nearly 45 to 60 days of credit. The merchants pay the seed companies through post-dated cheques. In turn the merchant sells the product on credit to the farmers. The same merchants sell the chemicals and fertilisers required for the crops. Getting everything under one roof and that too without paying cash, i e, on credit tempts the farmer and makes him receptive to suggestions given by the merchant. In this way the farmer sinks in to indebtedness.

Various seed and chemical companies that are operational in Warangal are Shaw Wallace, ICI, Rallis India, Saral India, Novratis, Nocil, Bayer with various brands. Some of these have come in after liberalisation opened the seed sector to foreign companies.

Maharashtra Cotton Failure

Similarly, farmers in Yavatmal district in Vidharbha, for the last few years, are facing of cotton failure despite favourable climatic conditions and uninterrupted supply of inputs. The yields have drastically decreased from a quintal to a few kilograms per acre over these years.

The plight of organic farmers is more severe and they are struggling for survival in the wake of failure of not only cotton but also other important crop seeds such as 'toor'. Till 1992, majority of farmers were cultivating basic normal hybrid (AHH 468) which was fairly consistent and provided normal yield. The problem in this region started since 1992, when a new variety of cotton (CAHH 468), was introduced to the farmers in the region. The farmers found that the new hybrid, which has not been certified by the government, failed to perform well in spite of all the care taken by them. As reported by the farmers, the yield registered was almost negligible in subsequent years. These seeds were supplied by some of the seed companies trusted by the farmers for years. Some of these include Nath Seeds, Aurangabad, Ajith Seeds, Jalana, and Sanjay Seeds, Jalana. The government outlets for selling seeds are supplying substandard seeds to the farmers. Some farmers have brought this to the notice of the authorities of these seed companies. For instance, 'karadi' (Bhima) seed (marketed by Mahabeej, Akola) which have been duly certified by a certifying agency was found to be substandard. Cotton and toor are commonly intercropped. These farmers found that not only cotton but also seeds of toor failed to perform.

Issue of Accountability

Unaccountability and lack of democracy under any condition generates disasters. This is the message of the increasing seed failure under globalisation. When techno-

logical totalitarianism converges with economic totalitarianism to make genetic engineering the basis of commercial activity by coercing farmers and consumers, the potential disasters can be unprecedented. The combination of total irresponsibility in manipulating the genetic structure of crops and totalising rights over life forms through intellectual property rights makes for absolute rights and absolute irresponsibility on the part of the biotechnology industry.

The question, which becomes very pertinent in this context, is that who is going to be accountable for what is happening to the farmers? Who is going to take care of the social and economic liabilities of the farmers? Who is accountable for meeting the biosafety norms? These are some of the basic questions, which need to be answered before anything further is done on the introduction of genetically engineered crops in India.

IV
SPS Quarantine and Biosafety Rules

The tremendous growth of research in the field of biotechnology has not been matched by the development of necessary infrastructure for education and research on biosafety, impact assessments on genetic engineering and for safety measures and regulations. There is presently no exact predictive science or exact predictive ecology capable of accurately anticipating the behaviour and effects of genetically modified organisms. Ecological dynamics display the entire range of complex behaviours typical of systems involving complicated couplings and feedbacks between different processes. This makes prediction inherently problematic and requires that utmost care be exercised in drawing even the most uncertain conclusions. Nevertheless, biotechnology regulators tend not to use the most advanced and modern sciences in making risk assessments. The precautionary principle should thus be strictly applied to activities involving genetic engineering.

There are grounds for suspecting that proponents of genetic engineering are following a policy of 'strategic ignorance', characterised by neglect of standards and safety considerations, disregard for scientific inputs and assessments, and suppression of information on adverse effects.

Policy on Registration of Seeds

In the present scenario there are two types of seeds available in the market for the farmers to buy. These are (i) certified seeds and (ii) truthful seeds. Certified seeds are sold on certification of purity by the government. For any company to launch certified seeds it takes at least six to seven years of undergoing trials and verifications under the supervision of government authorities. However to avoid such delays in the launch of seeds in market, seed companies sell the seeds as 'truthful' seeds, which means that the company sells seed asking the farmers to accept the company's claims as truthful. There is no regulation to prevent marketing of 'truthful' seeds. The sale and exchange of truthful seeds was prevalent among the farmers before the seed companies were functioning. The farmers used to exchange or buy seeds from other farmers and such seeds were known as truthful seeds because farmers could trust each other. The corporate seed companies replaced the farmers' seed supply but continued with the practice of using the label 'truthful' for seeds, and no public regulation was prevalent to prevent such sale.

In such a situation, the introduction of genetically engineered (GE) seeds becomes worrisome. In absence of any such regulation, the costlier GE seeds will offer no guarantee for whether they perform well or not. This will lead to complete erosion of the agricultural biodiversity and adversely affect the socio-economic status of the farmers. This will be further aggravated since GE seeds will be patented, and corporations will treat information about them as proprietary.

Indian Biosafety Regulations

In India, compliance of requisite safeguards at various levels of research on plants including the development of transgenic plants and their growth in soil is governed by biosafety guidelines issued by the department of biotechnology from time to time. In 1989, the ministry of environment and forests empowered the review committee on genetic manipulation (RCGM) to bring out manuals of guidelines specifying procedure for regulatory process with respect to activities involving genetically engineered organisms in research use and applications including industry with a view to ensuring environmental safety.

The figure gives the organogram for the presently existing guidelines for research, field trials and commercial application of transgenic plants. The committee which approves field tests and environmental release of GMOs is the Genetic Engineering Approval Committee (GEAC).

However, it is not clear whether the Monsanto trials were cleared by GEAC or by the Review Committee on Genetic

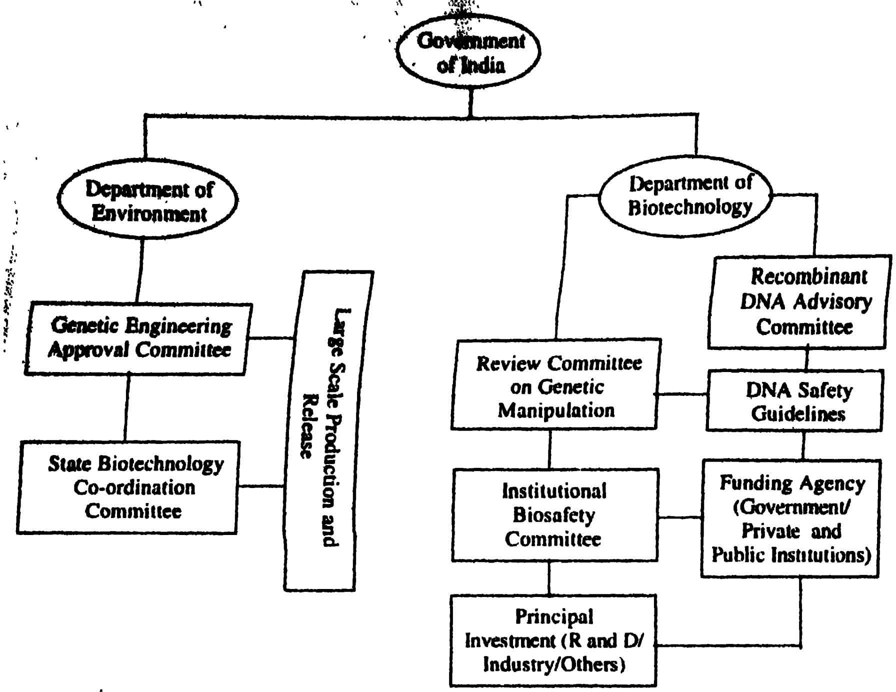
FIGURE 1: INSTITUTIONAL MECHANISM FOR IMPLEMENTATION OF GUIDELINES



Manipulation (RCGM). Since the state governments were not consulted and Mahyco has only shown a letter of approval from the department of biotechnology under which the RCGM functions, rather than the ministry of environment, under which the GEAC functions, it is possible that the trials only had a RCGM clearance, and not a clearance through GEAC which would have required consultation with state biotechnology co-ordination committees (SBCC).

However, RCGM is only supposed to clear contained lab experiments, not field experiments in open farmers' fields of the kind that are being undertaken in various locations in India. Field experiments need to be cleared by the GEAC since they take place in the open environment and their risks are not contained. The full ecological impact of such trials needs to take into account interaction with diverse species, impact on soil, impact on biodiversity and impact on public health.

According to Article 4.1 (i) and (ii) of Recombinant DNA Safety Guidelines, 1990, GEAC is supposed to regulate experimental field trials and research developmental activity. To quote Article 4.1 (i) and (ii):

4.1 GEAC will have the Biotechnology Co-ordination Committee under it which will function as legal and statuary body with judicial powers to inspect, investigate and take punitive action in case of violations of statutory provisions under EPA.

(i) Review and control of safety measures adopted while handling large-scale use of genetically engineered organisms/ classified organisms in research, developmental and industrial production activities.

(ii) Monitoring of large-scale release of engineered organisms/products into environment, oversee field applications and experimental field trials.

Since neither were the state governments involved, nor have the trials proceeded on a case by case and step by step basis from laboratory, to contained environment, to open environment and have been rushed to the stage of trials in open fields of farmers as the first step, Monsanto trials are clearly illegal and illegitimate even under the presently existing weak guidelines for regulation of GE crops.

Under Article 16 of the Environment (Protection) Act, 1986, these trials are an environmental offence and should be treated as such in law.

Offence by companies

(1) Where any offence under this Act has been committed by a company, every person who, at the time the offence was committed, was directly in charge of, and was responsible to, the company for the conduct of the business of the company, as well as the company, shall be deemed to be guilty of the offence and shall be liable to be proceeded against and punished accordingly:

Provided that nothing contained in this sub-section shall render any such person liable to any punishment provided in this Act, if he proves that the offence was committed without his knowledge or that he exercised all due diligence to prevent the commission of such offence.

(2) Notwithstanding anything contained in sub-section (1), where an offence under this Act has been committed by a company and it is proved that the offence has been committed with the consent or connivance of, or is attributable to any neglect on the part of, any director, manager, secretary or other officer of the company, such director, manager, secretary or other officer shall also be deemed to be guilty of that offence and shall be liable to be proceeded against and punished accordingly.

Explanation – For the purposes of this section,

(a) "company" means any body corporate, and includes a firm or other association of individuals; and

(b) "director", in relation to a firm, means a partner in the firm.

Under the above Article, Monsanto has committed an offence and should be deemed guilty and should be liable to be proceeded against and punished accordingly.

The produce from the trial plots of the *Bt* cotton has been directly sold in the open market mixing it with normal cotton. This has been serious lapse on the part of the permitting authority and the company as well. The produce from trials is to be fully contained and should have been destroyed by burning.

V
Monsanto's Trials in India

Even from the viewpoint of a totally inadequate biosafety regulation framework in this country, the Monsanto trials are illegal and unscientific. As long as the genetic engineering is taking place in labs or in farms that are totally contained, the RCGM of the department of biotechnology governs the approval. The moment trials are conducted on the open environment, as the case is with these trials, the GEAC governed by the ministry of environment and forests becomes active under the Environment Protection Act 1986. The list of all the trial sites is given in Table A. In what follows, we present how these trials are illegal, unscientific and fraudulent.

Planting of Bt Cotton before Permission Granted

The stamp of clearances for all the trials of genetically modified cotton came through P K Ghosh, who is the advisor to RCGM through its letter dated July 27, 1998 and August 5, 1998 to Maharashtra Hybrid Seeds Company (Mahyco) to carry out multicentric trials on transgenic cotton (*Bacillus thuringiensis*) initially at 25 locations by permission dated July 27, 1998 and thereafter 15 locations by permission dated August 5, 1998 making 40 locations in nine states. The date of sowing obtained from individual farmers show that the crop had been sown before the trial permissions were obtained in June 1998. Table 7 complied on the basis of actual field observation shows that the dates of actual sowing of *Bt* on the trial plots were much earlier to the permission granted by the wrong committee.

The field trials of *Bt*-cotton on 40 locations in nine states are totally unscientific and illegal. The permission granted to Mahyco-Monsanto for the open field trials is in category of organisms with potential ecological risks and these environmental risks need to be assessed and regulated in accordance with the rules called the 'Rules for the Manufacture, Use, Import, Export and Storage of Hazardous Micro-organisms Genetically Engineered Organisms or Cells, 1989' framed under the Environment (Protection) Act, 1986 (hereafter referred to as 'Rules'). The permission has been granted for carrying out multicentric field trials without assessing ecological impact on biodiversity, protection of environment, danger to agriculture and health hazards to human beings and animals. The said permission has not only been granted in violation of the provisions of the above mentioned Rules which clearly stipulate that any such permission can be granted only by the GEAC under the ministry of environment and forests, but also of the guidelines of department of biotechnology which have been framed under these Rules. Rules are totally inadequate to deal with the present state of genetic engineering. The permission is further vitiated by reason of the concerned nine states not being consulted before granting such permission when 'agriculture' is a state subject and such experimentation has direct impact on the agriculture of a particular state. In fact, the two committees, viz, state bio-technology co-ordination committee (SBCC) and the district level committee (DLC) were not informed in advance before the grant of permission as these committees are concerned with biosafety of such genetically engineered trials in the state as well as in a particular district. Therefore the permission which has been granted is violative of Articles 14, 19 and 21 of the Constitution; it is also violative of the provisions of Environment (Protection) Act, 1986 and the Rules framed under section 6, 8 and 25 of the said Act.

Myth of High Yield

The yields in all the trial plots were found to be low as compared to what the company promised. A comparison of the local hybrid variety cultivated and *Bt* shows that the yield from both the crops was more or less same. The failure of *Bt* to

yield has been reported from all over the world. The Mississippi Seed Arbitration Council has ruled that Monsanto's Roundup Ready Cotton failed to perform as advertised last year (1997) and recommended payments of nearly $2 million to three cotton farmers who suffered severe crop losses.

The performance of *Bt* with respect to other non-*Bt* cotton in some of the trial sites is given in Table 8. It has been observed that in almost all the sites, farmers reported that except for the protection from bollworm nothing much has benefited them. The cost of cultivation has also worked out to be same for all the farmers.

Myth of Reduction in Pesticide Use

According to industry, the promise of transgenic crops inserted with *Bt*-genes is the replacement of synthetic insecticides now used to control insect pests. Since most crops have a diversity of insect pests, insecticides will still have to be applied to control pests other than Lepidoptera not susceptible to the endotoxin expressed by the crop [Gould 1994]. On the other hand, several Lepidoptera species have been reported to develop resistance to *Bt* toxin both in field and laboratory tests, suggesting major resistance problems are likely to develop in *Bt*-crops which through continuous expression of the toxin create a strong selection pressure [Tabashnik 1994]. Monsanto company admits that bollworm larvae greater than ¼ inch long or 2 to 4 days old are difficult to control with Bollgard alone (see promotional material of Monsanto). It recommends applying supplemented insecticide treatment and further recommends to the farmers that "if sufficient larvae of this size are present you may need to apply supplemental treatment at intervals" [Monsanto Company 1996].

The company suggests maintaining a refuge to Bollgard cotton for pest/insect resistance management. These refuge acres must be planted in close proximity of Bollgard cotton and recommends that four acres of non-Bollgard cotton refuge for every 100 acres of Bollgard cotton should be planted. In India, most of the farmers in the cotton growing zones are small-scale farmers with small and marginal landholdings. For such farmers it is very difficult to maintain such refuges [Monsanto Company 1996].

In another instance, the pesticide effect of the engineered *Bt* was not sufficient to kill off all pests throughout the season as Monsanto promised. Mae-Wan Ho, of the UK's Open University, attributes this failure to unpredicted changes in the behaviour of the *Bt*-gene. In 1997, 20 per cent of the first commercial crop of Roundup Ready cotton suffered deformed bolls and bolls dropping off early.

An analysis by the Pesticides Trust on behalf of Greenpeace argues that the introduction of herbicide resistant varieties will alter the pattern of herbicide use but will not change the overall amounts used. If it leads to greater use of glyphosate this will damage other crops and have potential adverse effects on wildlife, including beneficial insects such as ladybirds. The analysis further shows that the compounds can remain active in the soil for long periods and can contaminate water [International Agricultural Development 1998].

Table 10: Comparison of the Field Trial Design with Actual Field Practice and Ecological Trial Parameters as Specified by Biosafety Regulations

Trial Design	Actual Field Practice	Ecological Trial Parameters
• Experimental design for the quadruplicate trials of *Bt*-cotton would be in field space of about 1,394 sq meters.	• 1,800 sq meters of plots were used.	• Impact of leaf fall on soil organisms. • Impact on non target species. • Emergence of resistance.
• Experimental plots containing transgenic *Bt*-cotton plants should be surrounded by an isolation distance of 5 meters with no plantations.	• No isolation distance. Instead crops were planted in between the plots.	• Experimental plots in total isolation. Series of experiments to be conducted in contained environment. • Assessment of the impact on other crop and plant species dominant in the region.
• Comparative assessment of lepidopteran pest load in randomised *Bt*, non-*Bt* field along with non-*Bt* foeld plantations due to host preference.	• No data available.	• Integrated analysis of flora and fauna in soil and agro-ecosystem within a distance covered by pollination potential.
• Performance of the *Bt* and non-*Bt* hybrids for yield and fiber quality.	• Manipulation in comparing the yield of *Bt* and non-*Bt* cotton by opting for its own inferior variety and not taking the most common variety cultivated by the farmers in the region.	• Local cultural practices should not be manipulated and comparison should be made with the most commonly grown variety of the crop.
• Keep full account of the transgenic materials and seeds in the transgenic plots and use all transgenic material in a contained environment.	• Free sale of the *Bt*-cotton produced mixed with normal cotton produce in the market by the farmers. No precaution of containment.	• Complete destruction of the material/produce obtained from the trials.
• All materials, like quantities of transgenic *Bt*-cotton seeds produced, transgenic cotton produce, etc, after experimentation be reported to the government.	• Taluk level concerned government departments unaware of the experimentation and did not receive any material or produce of the trangenic *Bt*-cotton.	• All concerned committees at all levels of institutional hierarchy should be well informed about any trials with the genetically modified organisms in the field.
• Ensure company authorised personnel permitted to visit experimental sites.	• Mahyco organised 'kshetra utsav' for publicity of the *Bt*-cotton among other farmers of the region surrounding the trial fields.	• While in research conditions all the results should be open and accessible to the interested citizens of the country.
• Ensure adherence to Recombinant DNA guidelines of the government of India.	• No adherence to the guidelines laid by the government of India.	• Strong biosafety regulations needed. • More public participation needed.

Table 11: Genetic Engineering

	Genetic Engineering Assumptions	Reality of Scientific Findings
1	Genes determine characters in linear casual chain: one gene gives one function.	Genes function in complex network; causation is multidimensional, non-linea and circular.
2	Genes and genomes are not subject to environmental influence.	Genes and genomes are subject to feedback regulation.
3	Genes and genomes are stable and unchanging.	Genes and genomes are dynamic and fluid and can change directly in response
to		the environment and give adaptive mutations to order.
4	Genes stay where they are put	Genes can jump horizontally between unrelated species and recombine.

The actual pesticide sprays by the farmers at various trial sites in India reveal that the use of pesticides has not at all stopped for *Bt* crop. Pesticide sprays ranging from as high as 12 to 15 in one of the trial fields in Haryana to a minimum of three in most of the trial fields have been observed. According to Basavanappa in Hagari Bommanahalli taluk, Bellary district, the number of sprays in all the three test plots of *Bt* and non-*Bt* has been almost the same. He incurred an expense of around Rs 6,700 for chemicals sprays and fertilisers. This amount is almost the same as that spent by all other conventional/hybrid cotton growers on purchase of chemicals and fertilisers in that part of the state. Table 9 gives the number of sprays farmers used on the *Bt* plots. Contrary to the claim of Monsanto about the reduction of chemical sprays, farmers had to revert to chemical spraying in spite of built-in insecticidal properties in the *Bt*-cotton.

No Environmental Assessment

The wrong committee asked Mahyco-Monsanto to generate data on pest load, performance in terms of yield and fibre quality, to compare the insect damage on the boll shedding and retention for *Bt*-cotton. There has been no concern to monitor the impact of transgenic crops on the surrounding flora and other relevant ecological aspects. A comparison of the field trial design with actual field practice and required ecological trial parameters as specified by biosafety regulations is presented in Table 10.

Potential Environmental Impacts

Transgenic plants are the crops that have been genetically engineered to contain traits from unrelated organisms. The spread of transgenic crops threatens crop genetic diversity by simplifying cropping systems and promoting genetic erosion. The potential transfer of genes from pesticide resistant crops to wild or semi-domesticated relatives may create new super weeds.

There is serious mismatch between the mindset of genetic engineering biotechnology and the reality of the new genetics (Table 11).

Insects were found to develop resistance rapidly to the transgenic plants with built-in biopesticide, when exposed to the toxin. This has been the problem with the *Bt*-cotton crop at Texas. The widespread use of *Bt* containing crops could accelerate the development of insect pest resistance to *Bt*, which is used for organic pest control. Already eight species of insects have developed resistance to *Bt*-toxins including diamond black moth, Indian meal moth, tobacco budworm, colorado potato beetle and two species of mosquitoes [Altieri 1998].

Due to potential risks associated with genetic engineering, article 19.3 of the Convention on Biological Diversity called for a biosafety protocol, which is currently being developed through international negotiations. This is also the reason France has banned all genetically engineered crops and the UK has responded to the call of citizens by having a 1-year moratorium on release of genetically engineered crops. Most recently, IFOAM, the world's largest body for organic agriculture called for a ban on genetic engineering from agriculture because it poses unnecessary hazards with little benefit for the development of agriculture.

Risks of Monsanto's Toxic Plants

Monsanto's genetically engineered 'Bollgard' cotton or *Bt*-cotton has genes from a bacteria engineered into it so that the plant produces its own pesticide. Contrary to Monsanto's claim, *Bt*-cotton is not 'pest-resistant' but a pesticide producing plant. The severe ecological risks of crops genetically engineered to produce toxics include the threat posed to beneficial species such as birds, bees, butterflies, beetles which are necessary for pollination and for pest-control though prey-predator balance. Nothing is yet known of the impact on human health when toxic producing *Bt*. crops such as potato and corn are eaten or on animal health when oilcake from *Bt*-cotton or fodder from *Bt*-corn is consumed as cattle feed.

Further, while pesticide producing plants are being offered as an alternative to spraying pesticides, they will in fact create the need for more pesticides since pests are rapidly evolving resistance to genetically engineered *Bt*-crops. The widespread use of *Bt* containing crops could accelerate the development of insect pest resistance to *Bt*, which is used for organic pest control. The genetically engineered *Bt*-crops continuously express the *Bt*-toxin throughout the growing season. Long-term exposure to *Bt*-toxins promotes development of resistance in insect populations, this kind of exposure could lead to selection for resistance in all stages of the insect pest on all parts of the plant for the entire season. Due to this risk of pest resistance, the US Environment Protection Agency (EPA) offers only conditional and temporary registration of varieties producing *Bt*.

Monsanto's technology will therefore destroy beneficial biodiversity and create superpests both through wiping out pest predators and by creating pests which are resistant to pesticides. Monsanto's pesticide producing *Bt*-crops are not based on the terminator technology, which terminates germination of seed so that farmers cannot save it. However, they are in an ecological sense terminator, which terminates biodiveristy and the possibilities of ecological and sustainable agriculture based on the conservation of biodiversity.

The ecological impact of *Bt*-cotton cannot be assessed on the basis of a 3-month trial. The trial needs to be carried out over 2-3 seasons and impact needs to be assessed on all organisms, including soil micro-organisms which have been known to be killed by the toxics in *Bt*-crops. To get the full ecological impact of biodiversity destruction and genetic pollution caused by genetically engineered crops, the following steps are necessary.

– a full biodiversity assessment of the ecosystem in which the GMO is to be introduced;

– impact of genetically engineered crop on diverse species including pollinators and soil micro-organism; and

– risks of transfer of genetically engineered traits to non-engineered crops through horizontal gene transfer and pollination.

None of these essential steps for ecological risks of GMOs has been carried out in Monsanto's present trials with Bollgard cotton.

When Monsanto states that they have had 93 per cent success they are referring to agronomic performance, not to ecological safety. Further, since the *Bt*-technology is aimed at pesticide production, not yield increases, Monsanto is deliberately distorting facts when it refers to yield increasing characteristics of Bollgard cotton.

Monsanto is also misinforming the public when it states that pesticide producing plants mean no pesticide needs to be sprayed. The primary justification for the genetic engineering of *Bt* into crops is that this will reduce the use of insecticides. One of the Monsanto brochures had a picture of a few worms and states. 'You will see these in your cotton and that's OK. Don't spray.' However, in Texas, Monsanto faces a law suit filed by 25 farmers over *Bt*-cotton planted on 18,000 acres which suffered cotton bollworm damage and on which farmers had to use pesticides in spite of corporate propaganda that genetic engineering means an end to the pesticide era. Cotton bollworms were found to have infested thousands of acres planted with the new variety of cotton in Texas.

Trial Farmers and Mahyco-Monsanto

Unscientific sampling of the farmers and sites: The selection of the farmers for the illegal trials was based on totally unscientific sampling techniques. The company as well the government hurried up for trials without determining the sampl

site for the trials. Most of the selected farmers for the trials were either seed distributors or had long-term association with the company. In this selection process it seems there has been some vested interest of the dealer-farmer in terms of getting favour for the dealership of the GE seeds in future from the company.

Based on prior acquaintances, Mahyco contacted the individual farmers. In all these zones Mahyco used to supply the farmers with new hybrid seeds for initial trials. Based on the performance of these new seeds, farmers patronised Mahyco and established good rapport. Most of the trials were based on this mutual trust which the farmers have developed with Mahyco.

At most of the trial sites, farmers selected were the exemplary farmers who were singled out on the basis of their past performance in the yield of major crop in the previous cropping season. Those farmers were presented with trophies and other awards so as to maintain their faith in the company. For instance, Sri Bassanna at Sindhanur district in Karnataka, was selected for the trial based on performance for best yield in paddy.

All the trial sites were on the main approach road. This has been purposefully done so that the visit of the supervisory staff is easier. These trial plots were not isolated, as is mandatory from the biosafety point of view and were amidst other surrounding fields.

In some of the trial sites, Mahyco's own dealers were given seed to test *Bt* on their fields and for recommendation to other farmers. Mahyco agreed to meet the expenditures incurred on the cultivation of the *Bt*-crop on their fields.

No independent scrutiny of trials: There has been no appointment of independent group comprising of outside scientists/citizens other than company personnel, to closely monitor the data and results generated by the joint venture and the government. This has been done to produce suitable data to get approval of the concerned ministry of the government. At the field level, none of the village/taluk level government organisations have been contacted prior to taking up trials in open fields. The Research Foundation has intervened to ensure public assessment of the trials.

Enticing the farmers: In order to attract other farmers, the company organised 'khestra utsav' to show the crop performance to other villagers from neighbouring villages. This has been the strategy of many companies on market expansion through concentrating upon development of market *per se*, rather than pushing their own particular brand. Farmers are invited to the fields of another exhibiting uncommonly high yields of branded seed. However, during shows organised by the Monsanto-Mahyco, the cost of technology has not been revealed to the farmers which is associated with sale of genetically engineered seeds. Thus, cost of such technology becomes important in the context where farmers have had the options of exchange of saved seeds and purchase of hybrid seeds at much lower price than the *Bt*.

Cost of the *Bt* Technology

Bt technology is not free of cost to the farmers. These farmers have to pay for the non-cotton gene inserted into the cotton genome. The fees that are charged to farmers are related to the benefits or saving made in planting the transgenic cotton varieties. It is generally presumed that *Bt*-cotton if planted would significantly reduce the need for spraying insecticides and accordingly the technology fee has been related to the insecticide use.

Each farmer interested to plant *Bt* variety has to sign an agreement with Monsanto. One of the important conditions of the contract is that the seeds can neither be saved for next year nor passed on to other cotton growers. The company apparently intends to reap technology benefits for years to come by extending the duration of agreement.

It has been observed that the performance of *Bt*-cotton is not always profitable. According to a study by Sutton (1998) it was not profitable to grow *Bt*-cotton in Arkansas during 1997. The study involved two similar fields on the same farm at seven locations for comparing cost of production and net returns from *Bt* verus non-*Bt* cotton varieties. The study noted that the differences between the *Bt* and non-*Bt* fields were in the area of technology fees, cost of insecticides and their application, growth regulators and second harvest costs. In most *Bt* fields, the additional cost of seed, the necessity of using plant growth regulators, the technology fee and the need to make second pick were responsible for higher cost of production. It is very clear through various studies [like Sutton 1998; Bryant et al 1997] that wherever the bollworm pressure is not high, *Bt*-cotton might not be *economically suitable.*

Gibson et al (1997) compared the cost and returns associated with growing *Bt* cotton and non-*Bt* in Mississippi for two years. The study reveals that there was no difference in the total cost of production but better yields were reported in case of *Bt*-cotton. However, *Bt*-cotton required more expenses in the form of fertilisers, fungicide treatments and the technology fees. The Table 12 provides the performance of *Bt* to that of non-*Bt* cotton in Mississippi in 1995-97. It is observed from the table that the amount spent on insect control together with the technology fee exceeds for *Bt*-cotton in all the years and made it more expensive for the farmers. Thus the total cost for *Bt*-crop is on an average 50 per cent more than that of non-*Bt*-crop.

The Andhra Pradesh government initiated steps to prevent the introduction of *Bt* by asking M K Sharma, managing director, Mahyco-Monsanto Biotech (I) to stop the field trials in its seven districts. However, the government has made it clear that if the company still wants to continue with the trials, it will be permitted to carry them out in the research stations of N G Ranga Agricultural Research University.

For the trials, the company has not charged any technology fees. However for commercial sale of the seeds the company is certainly going to impose technology fees. In such situation, there will be tremendous pressure on the farmers and ultimately the very survival of farmers will be threatened. There is absolutely no difference in terms of total returns for *Bt* and non-*Bt* crops of cotton.

Threat to Organic Farmers

With the introduction of genetically modified crops, per acre cost of cultivation will increase with increase in added costs in terms of seed cost, technology fees, and use of chemicals. In the present situation with internal inputs used by organic agriculture, the added costs are almost negligible except for the cost of seeds. Most of the farmers save their seeds and use them for cultivating in the following season. Other inputs are also provided on

Table 12: Performance of *Bt* vs Non-*Bt* Cotton in Mississippi 1995-1997

		1995		1996		1997	
		Bt	Non-*Bt*	*Bt*	Non-*Bt*	*Bt*	Non-*Bt*
Lint yield	kg/ha	1086	983	1002	950	1103	1009
Insect control	US$/ha	176	232	157	144	209	204
Bollgard fee	US$/ha	204		61		133	
Total cost	US$/ha	380	232	218	144	342	204
Total return	US$/ha	1176	1176	1218	1218	1239	1239

Source: ICAC, June 1998.

costs will appear and the farmer will get into serious financial troubles.

The additional burden on the farmer switching over to *Bt*-cotton from conventional variety is nearly nine times more in terms of seed cost, technology fee of nearly US$ 80 per hectare and more spending on pesticides and chemicals. Most calculations used by Monsanto compare the costs incurred by the farmers of developed countries. The estimates for Indian farmers are totally different and have profound impact when the comparisons are made in Indian context between cultivation with genetically engineered seeds and cultivation under organic conditions.

Socio-economic costs of GE seeds for Indian farmers: The genetic engineering option is projected as leading to lower chemical use and hence economic benefits by comparing it to chemical intensive, large-scale industrial monocultures. GE is not compared to ecological organic agriculture which is perhaps the only real alternative. However the comparison of genetically engineered crops that should be made is not with chemical intensive agriculture but with ecological regenerative agriculture. In addition to the increased cost of chemicals, the shift from ecological agriculture to genetic engineering also leads to increased costs of seed, including technology costs, which are never mentioned when the economic benefits of transgenic crops are assessed. Field survey indicates per acre seed cost of Rs 550, technology cost of Rs 2,000 and pesticide cost of Rs 7,500. Ecological farming has no expenditure in terms of seed cost, technology fee imposed on the seed and the cost of pesticide. Once there is shift in the farming system, from ecological to that of genetically engineered farming, the farmer has to bear Rs 10,500 per acre additional cost apart from other input costs such as labour costs.

As per 1997-98 figures the total area under cotton in India is 214 lakh acres. Therefore, if whole of the cropping shifts to genetically engineered cotton then nearly Rs 16,050 crore on pesticides and Rs 22,470 crore on entire cotton cultivation will be the added costs compared to the ecological option of internal input agriculture. The false comparison with chemical/industrial agriculture rather than with ecological organic agriculture is used to create the illusion of sustainability of genetically engineered crops.

Inadequacies of Biosafety Regulations

The clearance of Monsanto's trials with toxic plants without the democratic consent of concerned governments, from state to local level and democratic participation of the public in biosafety decisions reveals the loopholes and inadequacies in the present biosafety regulations both from the democratic perspective and the ecological perspective. The trial produce has been freely marketed without adhering to any containment process.

The clearance for trials of genetically engineered crops and their release needs to be given not just by the central government but by all levels of government, from the state to the local level. Further, before any clearance is granted for trials of a particular genetically engineered crop the application for trials should be notified to the public as part of the citizen's right to know. Public hearings need to be organised in the specific villages and districts and states where the trials and introductions are planned.

The scientific framework for assessing the ecological impact of genetically engineered crops on biosafety, ecosystem health and public health also needs to be upgraded for dealing with the impact of field trials and deliberate releases under diverse ecological contexts existing in India.

If Monsanto and the Indian government fail to fulfil these ecological and democratic criteria for field trials of genetically engineered crops, we will have further evidence that the promotion of genetic engineering by corporations like Monsanto can only be based on dictatorial, distorted and coercive methods. In such context, genetic engineering in agriculture must necessarily be anti-nature and anti-people.

VI
Need for Biosafety Regulations

The Monsanto trials with genetically engineered crops have clearly shown that there are many gaps and many weaknesses in the regulation of genetically engineered (GE) crops and there is an urgent need for strengthening the biosafety regulations in India.

Regulatory Anarchy in Genetic Engineering

The trials have shown that under the present regulations it is possible for a company to perform GE trials secretly without prior informed consent of either the state government or the local community or gram sabha. The agriculture minister of Karnataka, Byre Gowda, learnt about the trials in his state through the newspapers. The agriculture minister of Andhra Pradesh said that the department of biotechnology had given the clearance for trials to Mahyco without informing the state government. The fact that it was Mahyco which got the clearance but Monsanto which carried out the trials shows how much anarchy exists in approval for GE experiments and commercialisation.

The approval of trials should include prior informed consent of state governments or local communities or gram sabhas. The states should be included because agriculture is a state subject. People should be included because decentralised democracy and panchayati raj are commitments which have been made through the Constitution. The present regulations have no respect for the decentralised democracy required by panchayati raj. Nor do they have any room for public participation in decisions about genetic engineering either at the experimental stage or at the commercialisation stage. These lacunae must be filled to ensure democratic participation and decision-making.

The anarchy, chaos and confusion in the regulatory system needs to be stopped. This requires that all trials are stopped till biosafety regulation is made strong, coherent, scientifically sound and transparent through public participation.

Public Monitoring of Private Corporations

The Monsanto trials have also revealed that the corporations pushing genetically engineered crops are simultaneously the judge and accused.

When Trade Related Intellectual Property Rights (TRIPs) Agreement of WTO was signed, a Monsanto representative had claimed that Monsanto with other corporations had shaped and designed the agreement. As they stated, "We were the physician, the diagnostician, the patient – all in one". In the area of biosafety too, Monsanto seems to be functioning as the diagnostician, physician and patient – all in one.

They are the source of information on biosafety, they carry out the trials without government and public monitoring and they themselves declare their activities as safe and causing no risks. The information on risks and status of the GMO are provided to GEAC by the company, not the government, ensuring that biosafety information is biased, not neutral.

The Andhra Pradesh government's order to Mahyco-Monsanto to stop trials and to only carry them out in the research stations of N G Ranga Agricultural University under the direct supervision of government scientists is a precedence that should be applied nationwide. Genuine biosafety requires that experiments with GMOs prior to commercialisation be carried out in the public system and not by the private firm

that stands to gain through commercialisation and has nothing to lose if there is 'genetic pollution' and risks posed to the environment and public health.

The public system science and technology capacity in India is high. Our scientists have wider knowledge of plants and ecosystems than Monsanto's scientists or narrowly trained biotechnologists whose expertise is restricted to petridishes and does not cover ecological and ecosystem expertise. Public scientists with ecological expertise will therefore do a much more comprehensive job of assessing the ecological risks of transgenic crops than corporate scientists with biotechnology expertise. This will also ensure better monitoring and control over the trials.

In addition to experiments being carried out in public system institutes, public participation in the monitoring of trials is also essential.

'Substantial Equivalence'

The entire genetic engineering guidelines is based on the false assumption that GMOs behave like their naturally occurring counterparts. The guidelines are also based on the totally incorrect assumption that "G E organisms have greater predictability compared to species evolved by traditional techniques". Neither of these assumptions is true. GMOs do not behave like their naturally occurring counterparts and the behaviour of GMOs is highly unpredictable and unstable.

Naturally occurring *Klepsiella planticola* does not kill plants, but as research at the University of Oregon has shown, the genetically engineered Klepsiella was lethal to crops [Report of the Independent Group 1996].

The naturally occurring *Bacillus thuringiensis* (*Bt*) has not contributed to the evolution of resistance in pests, but the genetically engineered *Bt*-crops create rapid resistance evolution because the *Bt*. toxin is expressed in *every* cell of the plant, *all* the time [Shiva 1998]. The assumption of 'substantial equivalence' does not hold, and biosafety regulation is undermined because of this false assumption of substantial equivalence.

The assumption of 'predictability' is also totally false. While genetic engineering makes the *identification* of the gene to be transferred into another organism more predictable, the ecological behaviour of the transferred gene in the host genome is totally unpredictable. A transgenic yeast engineered for increased rate of fermentation with multiple copies of one of its own genes, resulted in the accumulation of the metabolite, mythyl-glyoxal, at toxic mutagenic levels. Intransgenic tobacco, 64 to 92 per cent of the first generation of transgenic plants become unstable. Petunias do not have unstable colouring, but genetically engineered petunias changed their colour unpredictability due to 'gene silencing' [Report of Independent Group of Scientific and Legal Experts on Biosafety 1996].

Monsanto's Round up Ready Cotton engineered to resist Monsanto's herbicide Round up, had its bolls falling off, an instability which does not occur in the naturally occurring cotton and was induced unpredictability due to genetic engineering of herbicide resistance. Monsanto has been sued for millions of dollars because of the losses incurred by farmers.

GMOs do *not* have greater predictability compared to species evolved through traditional techniques. Since the very assumptions underlying our genetic engineering guidelines are false, we need to evolve new biosafety regulations on the basis of honest and good science, after assessing all the independent scientific evidence available across the world. Guidelines based on anti-democratic structures and unscientific assumptions provide no safeguards for the public or the environment. Strong biosafety regulation with strong public participation is both a democratic and an ecological imperative. The public and the government needs to act immediately to prevent private corporations from unleashing irreversible genetic pollution through the release of G E organisms in the agriculture and the environment.

– A five-year moratorium should be introduced on all commercialisation of genetically engineered crops both through imports and through seed production and distribution in India while full and adequate ecological and regulatory frameworks for assessing the ecological impact of genetically engineered crops and public participation is evolved.

– The regulatory framework for genetic engineering is not just inadequate in India. It is inadequate worldwide. In the US, trials for such crops do not have any ecological dimensions. They only assess agronomic performance. The data from the hundreds of US trials is basically 'non-data from non-trials' in the ecological context.

– The large-scale seed failure pushing farmers to suicides create the need for strict certification and liability for the commercial seed sector. This issue of liability becomes urgent in the context of genetically engineered seeds which in addition to normal risks of seed failure have the potential of leading to genetic pollution and high ecological risks.

– The farmers' seed supply and direct exchange network must be strengthened through community control and local participation. Farmer's seed supply system must be treated totally distinct from the commercial seed supply system. While the commercial private seed supply system needs strong state regulation, farmer seed supply should function free of state interference with strong community control and public participation.

Biotechnology and genetic engineering in agriculture is evolving in a total regulatory vacuum as it is clear from the US situation. Monsanto itself states, "Monsanto should not have to vouchsafe the safety of biotech food"; "Our interest is in selling as much of it as possible. Assuring its safety is the FDA's job". FDA does not look at the safety of *Bt*-crops since such crops are treated as a pesticide. EPA which is supposed to look at safety of pesticides treats genetically engineered crops which produce pesticide as conventional crops and hence does not look at the safety either. There is, therefore, no agency guaranteeing the safety of genetically engineered crops. It is to fill this policy vacuum for environmental safeguards that citizens worldwide are calling for a five-year moratorium on genetic engineering in agriculture.

National Human Development Initiative

Education in the Union Budget

Jandhyala B G Tilak

The finance minister in his budget speech stated that "high priority is being accorded to problem of the human resource development in the Ninth Plan". One of the important components of the 'National Human Development Initiative' announced in the Union Budget is education. Education is also recognised as an important item of 'basic human development needs' and is one of the items of the prime minister's special action plan. Do the programmes and financial resource allocations proposed in the Union Budget, and the Ninth Plan match these high sentiments expressed in favour of education? Answers to this question is attempted here examining the Draft Ninth Five-Year Plan 1997-2002, the Economic Survey 1998-99, *and the* Budget 1999-2000.

THE budget is neither a policy paper, nor is it a plan document. It is only a budget document. Plan is an instrument of the government to translate the policy into a plan of action; and budget represents financial commitment of the government to put the plan of action on the field. In this sense, one can expect a vision in the policy paper and in the perspective plan, and to some extent in the five-year plans, but one may not expect a vision, not to speak of a great or a radical vision, to flow from an annual budget speech of the finance minister and the related budget documents. At the same time budget is an important document, as it reflects the actual priorities, including changing priorities, of the government in terms of financial allocations. Besides, the budget for 1999-2000 assumes significance as it raises expectation of the people for this forms the first budget of the present union government after the Ninth Five-Year Plan was approved. That the plan is in only a draft form that too after two years of the plan period are over, is a different issue. Further, as this is the budget that takes the nation into the next century and the millennium, whatever it may mean, people may rightly have high expectations on the budget.

One of the important initiatives proposed in the Union Budget 1999-2000 'to empower vulnerable groups in society' is the 'National Human Development Initiative' (NHDI) that includes making available food, health care, education, employment and shelter to the entire population of this country within a decade. The finance minister has also stated in the budget speech that the NHDI "will go a long way in empowering the weakest sections of the population and improving the quality of rural life". This short article is concerned with one component of the NHDI, viz, education. The government recognises that education is an important item of 'basic human development needs'. It is also promised in the budget that "high priority is being accorded to the problem of human resource development in the Ninth Plan" (*Expenditure Budget*, vol I, p 43). Education is also identified as an item of the prime minister's special action plan (SAP) (an acronym that unfortunately refers to a different set of policies) in the Ninth Five-Year Plan. Do the programmes suggested in the Ninth Five-Year Plan and in the Budget and the allocation of resources in the Union Budget 1999-2000 match these hymns sung in praise of education? What is the place accorded education in the Union Budget? What are the education priorities of the government reflected in the budgetary allocations? And what are the programmes that the government intends to initiate in this context. Answer to these questions is briefly attempted here examining the three major documents of the government that are made available to the public within a gap of few days during the last two-three weeks, viz, the *Draft Ninth Five-Year Plan 1997-2002*, the *Economic Survey 1998-99*, and the *Budget 1999-2000*.

The Context

First, the context. The *Economic Survey* reports on the rapid quantitative achievements made in literacy, number of primary schools, enrolments, improvement in dropout, etc, during the post-independence period, which is indeed impressive, as there has been a quantitative explosion in numbers in the five decades of independence. But the *Survey* refuses to note that there are yet a large number of children who should be in the schools, but are not. According to the 42nd round of the National Sample Survey [NSSO 1991], there were about 70 million children out of school in the country in 1986-87. While we claim to have made rapid progress in enrolment of children into schools, quick calculations based on the 52nd round of the National Sample Survey conducted in 1995-96 suggest to the contrary. The number of out of school children has indeed grown significantly during the decade. It could be as high as 90 million in 1995-96 (Table 1). Had this growth continued, which is most likely, it means that India plans to enter the 'knowledge based society' of the 21st century with about 100 million children who perhaps have never been to any school. Unfortunately, neither in the Five-Year Plan nor in the annual budget, the magnitude of the problem is recognised, and any urgency has been shown to check the growth of out of school children in the country, though at the same time it is stated in the budget speech that "access to primary education is critical for empowering poor".

Secondly, the Five-Year Plan and also the Budget seem to have paid no attention at all to another important issue, viz,

Table 1. Out of School Children in India, 1995-96

Age Group	Population 1996 (Million)	Age-Specific Attendance Rate (Per Cent)	Children in Schools (Million)	Out of School Children (Million)
6-11	144.59	69	79.07	65.52
11-14	86.16	72	62 04	24.12
6-14	230 75	61	141.11	89.64

Note. Age specific attendance refers to children of the given age group enrolled in any level of education

Source: NSSO (1998) for attendance rate; and Registrar General of India (1996) for population.

requirement of financial resources for mak-
ing elementary education a fundamental right. Finding resources to finance this fundamental right is an urgent task as well as, contrary to popular fears, is an entirely achievable task. On the basis of the recommendation of the high powered Saikia Committee [Government of India 1997], a group of experts was constituted to estimate the requirement of financial resources for making elementary education a fundamental right in the Constitution. The group submitted its report recently and the *Report* [Government of India 1999] was available to the government just in time for the preparation of the Five-Year Plan and the annual budget; but it could not receive any attention of the government. Based on a detailed estimation of costs of each item/programme, the group of experts has estimated that universalisation of elementary education requires additionally Rs 136.8 thousand crore during the next 10 years. While this figure may seem to be awesome, certainly being much higher than the Rs 40,000 crore for a five-year period, estimated by the Saikia Committee, it needs no special skills to understand that additionally it means only Rs 14,000 crore a year on average, or additionally 0.7 per cent of GDP (if the GDP grows at a modest rate of growth of 5 per cent per annum). This should be easily possible. According to the committee's estimates, this would provide for a reasonably good pupil-teacher ratio of 1:30, improved physical access to schools, provision of instructional material, other necessary incentives, and on the whole a tolerable minimum level of quality of education, etc, to every child in India by the end of the first decade of the 21st century. The expert group also felt that if the government is serious about allocation of 6 per cent of GDP to education, the task becomes much more easy: 6 per cent of GDP would not only provide the needed resources for universalisation of elementary education, but it also allows provision of additional resources for growth of secondary and higher education. Further, the group showed that increasing of total allocation to education to reach 6 per cent of GDP is not at all difficult, given (a) the economy is likely to grow at a rate of growth of above 5 per cent, (b) the likely increase of tax/GDP ratio from 16 per cent to 18 per cent, and (c) the likely increase of the non-tax-revenue/GDP ratio from about 6 per cent to 5 per cent during the next 10 years. The expert group also observed that as the states might find it difficult to provide additional resources for elementary education, the centre would have to provide for a lot of the additional resources as most of it would come as a Plan expenditure". The group also had attempted to clear two absurd propositions that are in circulation: (a) that we cannot have universalisation of elementary education, because it is too costly; and (b) that the only way to have it to divert funds to it from higher education.[1]

While the *Report* and the estimates therein do not seem to have received the attention of the government, the issue of making elementary education a fundamental right and thereby a justiciable right through the constitutional amendment cannot be brushed aside, as (a) the 83rd amendment of the Constitution is pending before the parliament for approval, this having been introduced long ago in 1997 in Rajya Sabha, and more importantly (b) the judgments of the Supreme Court (1992, 1993) already made elementary education a fundamental right. As Tilak (1999) argued, "there is no need to wait on the part of the government or society at large to initiate any meaningful action towards providing this fundamental right to everyone". The government of India and the governments in India seem to prefer waiting for the uncertain adoption of the bill to initiating any immediate action. The Union Budget (1998-99) made an allocation of Rs 35 crore as 'special assistance' to states and union territories for implementing elementary education as a fundamental right. The revised estimate is only Rs 1 crore. Now a token amount of Rs 5 crore is allocated in the 1999-2000 Budget, stating that the *special scheme* "has not come into operation as the bill is yet to be considered by parliament". No efforts are being made by the states in this direction; and no special efforts have been made by the union government either. The Ninth Five-Year Plan and the annual budget do not propose any specific programme as such. It is obvious that the bill seeking the 83rd amendment is not a priority item on the national agenda.

Education Guarantee Scheme

By identifying education as an important item of the NHDI, the government of India expresses its intention of according a high priority to education. But that priority is not clearly explicit either in the programmes identified in the Five-Year Plan, or in the annual budget or more importantly in the budgetary allocations. A major important initiative that the government proposed in the Budget is the 'Education Guarantee Scheme' (EGS) at the national level. Aimed at "providing an opportunity to the rural poor, especially those belonging to the scheduled castes, scheduled tribes and other backward classes to secure education for their children", drawing from the experience of EGS of the government of Madhya Pradesh [Gopalakrishnan and Sharma 1998] a national programme of EGS is being proposed by the union government. The scheme is meant for those areas where no school currently exists within a radius of 1 km. So these areas could be the areas where the poorest of the poor live. By adopting distance norms (the school could be located within a walking distance - being replaced by radius - of 1 km), norms regarding size of population of the habitation (minimum size required is 300), etc in educational planning until now, the educational needs of the population in these areas were neglected, stating that it is 'unviable' to open a school in such areas. So payment of attention to these areas now is important. But the EGS has a major internal contradiction.[2] The EGS envisages the poor local community to (a) come forward, expressing demand for a school, (b) specifically provide the premises required for a school, (c) provide for a local part-time teacher, and (d) maintain the school at least for two years with the gram panchayat mobilising contributions in cash and kind from the local community. The role of the government – the centre and the state – is confined to providing teaching material and other assistance, and to 'support' the important initiative. After the poor village community maintains the school 'successfully' for two years in an area where otherwise the government feels that a school is an unviable proposition, perhaps the government would come forward with more assistance. The logic behind the national EGS to involve local community in education may seem sound; but there is, thus a contradiction in expecting the local community in the poor, small and scattered habitations to do all the one listed above. In a normal area (may be urban), where already schools exist, a new school if required, may be started with the full assistance by the government or local body, or be established by the government itself; but in the poorest of the poor regions, where people were deprived of a minimum schooling facility for several years (perhaps in addition to deprivation of all other basic needs), people are required to pay in cash and kind and initiate a schooling activity on their own!

Moreover, with the criterion of maintenance for two years, in effect, the govern

ment may not have to spend any significant amounts in starting 1.8 lakh promised primary schools during the Ninth Five-Year Plan period, as already more than two years of the plan period are over. Accordingly it is not surprising to note that there is no specific allocation in the current budget for EGS separately.[3]

Unfortunately, the *Economic Survey 1998-99* that is presented to the parliament a few days before the presentation of the Union Budget, also does not indicate the nature of 'high priority' that is likely to be accorded to education. In the 170 pages of the *Survey* (excluding the statistical appendix), a little more than a page is devoted to education; and education is also confined to 'Primary Education and Literacy'. Not even an oblique reference could be found to secondary or higher education, not to speak of higher professional/technical education. This trend – of confining the *Economic Survey* and other major official documents to primary education and literacy – could be noted in the last few years, making one to fear that we may gradually end up with only primary education or literacy. Sometimes the distinction between the two – primary education and literacy was also found missing.

In addition to referring to many ongoing programmes, the *Economic Survey* makes reference, drawing from the *National Agenda of Governance* to two policy relevant statements that are somewhat inconsistent with the long held official position. What are they?

Universal Primary or Elementary Education ?

The first specific reference in the *Economic Survey* is to free and compulsory primary education. "Education for All – Free and compulsory education up to the fifth standard and total eradication of illiteracy" (p 150). The Article 45 of the *Constitution of India* states that "the state shall endeavour to provide, within a period of 10 years from the commencement of this Constitution, for free and compulsory education for all children until they complete the age of 14 years" Accordingly, every Five-Year Plan, the *National Policy on Education 1968* and the *National Policy on Education 1986*, clearly stated that free and compulsory education refers to eight years of elementary education and the relevant age group of the children was 6-14. The Supreme Court of India in its judgment (1993) also observed: "The citizens of the country have a fundamental right to education...every child/citizen of this country has a right to free education until he completes the age of 14 years..." Thus the constitutional directive of free and compulsory education has been interpreted all these years so as to refer to eight years of elementary education – five years of primary education and three years of upper primary. But the *Economic Survey* refers to education up to fifth standard only.[4] In fact, based on international evidence, some [e g, Tilak 1998] argue that it is desirable to extend at least gradually the duration of the cycle to the whole school education, i e, 12 years of schooling for the children of the age group 6-18. But the *National Agenda of Governance*, the draft Ninth *Five-Year Plan* (vol II, p 101) and the *Economic Survey* (p 150) – all refer to primary education only and further not to give any illusion that by primary education actually elementary education is meant, all clearly say, "up to fifth standard" only. Also in the discussion under 'Primary/Elementary Education' in the draft Ninth *Five-Year Plan* (vol II, pp 115-16) the whole discussion is rather exclusively on primary education: upper primary education does not figure at all, except stating that "greater emphasis will naturally have to be laid on achieving UPE at the lower primary stage, in the first phase" (p 117). Such an approach may lead, paradoxically, as the nation gradually progresses, to minimisation of minimum basic needs of human development in India.

Share of Education in National Income: Six Per Cent of GNP?

The second issue relates to financing of education. The *Economic Survey* states: "Financing of education – increase in government and non-government spending on education, and bringing this up to 6 per cent GDP level" (p 150). This is also not altogether new, though few expected that it would find a place finally in the *Economic Survey* and in the draft Ninth Five-Year Plan. The *National Agenda for Governance* has promised to "formulate and implement plans to gradually increase the governmental *and non-governmental* spending on education up to 6 per cent of the GDP" (p 5; emphasis added). The *Economic Survey* (p 150) repeats this goal verbatim; so does the draft Ninth *Five-Year Pla* (vol II, p 101). This is not in conformity with the widely accepted view and the resolve made by the government of India repeatedly earlier that the *government expenditure on education* would be raised to the level of 6 per cent of GNP or GDP.

The origin of this resolution is the recommendation of the Education (Kothari) Commission. The Education Commission (1966) under the chairmanship of D S Kothari had recommended that the public expenditure on education in India should be increased to at least 6 per cent of national income by 1986. The recommendation was based, *inter alia*, on (a) the projected requirements of education sector in India, and (b) on international comparisons. This goal was reiterated in the *National Policy on Education 1968*. Since the goal could not be achieved, the goal was again reiterated in the *National Policy on Education 1986* (including the revised Policy in 1992). The review committee on National Policy on Education (Acharya Ramamurthy Committee), and the several reports of the CABE have repeatedly made it clear that 6 per cent of national income should be devoted to education from the government exchequer – by the central and state governments. The then prime minister of India also promised in 1993 from the ramparts of the Red Fort to the same extent.

When some doubts were expressed on this clause in the *National Policy on Education 1986*, Anand Sarup (1988), former education secretary, who was involved in the formulation of the *National Policy on Education 1986* made it abundantly clear. Sarup (1988:253) observed: "Since it is public policy on education that is the crucial determinant of available educational places and opportunities in our country, *it (6 per cent) is the Centre and State expenditure on education* that is used for policy planning and implementation. This includes both plan and non-plan outlays" (emphasis added).

Secondly, the Education Commission observed that "economically advanced countries like Japan, US and USSR were spending more than 6 per cent of their GNP on education. These countries spent no more than a small fraction of their GNP on education at the beginning of the century. Further, these countries might be spending about 10 per cent of GNP by 1986, and in fact more than 10 per cent, if comprehensive disarmament takes place. The gap between India and other rich countries needs to be reduced" and accordingly recommended that India should allocate 6 per cent of national income to education.

Since international comparisons formed an important basis for the recommendation of the Kothari Commission, it is important to note that most international statistics[5] and national level statistics on education expenditures in other countries refer to public expenditures only. These statistics rarely include private expenditures on education.[6]

One can also safely conclude that the recommendations of the Delors Commission [International Commission on Education for the Twenty-first Century 1996],[7] UNDP and other intentional organisations are at least partly influenced by the policy goal of the government of India that it would allocate 6 per cent of national income from the public exchequer.

Thus inclusion of non-governmental spending on education for the purpose of reaching the goal of 6 per cent of GDP (and to show that we have over or nearly achieved) is thus against the letter and spirit of the resolution of the government of India (1968) and later official papers.[8] It may also be noted that when the Planning Commission made earlier during the Janata government period a similar attempt formally or informally in 1988 [Kolhatkar 1988], reinterpreting the 6 per cent to be consisting of public and private expenditures, it backfired, with an uproar in the parliament and finally the government sticking to the earlier position of allocating 6 per cent from the government sources.[9]

Of course, there is no sanctity of the 6 per cent norm, as actual requirements of financial (and physical) resources for education have to be periodically worked out, as has been stated in many policy documents. According to the recent estimates [Tilak 1994], the government expenditure on education has to be raised to above 8 per cent of national income to fulfil the modest goals of the education system. Instead of planning to raise the level of public expenditure from the current level of 3.7 per cent of GDP[10] to at least 6 per cent, if not higher, the government seems to be arguing that the goal has already been achieved, as it is argued that the 6 per cent should compose of not only government expenditure, but also household and private sector, including household expenditures on education. This is attempted in the *Economic Survey* as well.

Allocation of Financial Resources

Now a few specific issues on allocation of resources to education. First, the draft Ninth Plan does not give any details regarding allocation of resources to education, not to speak of allocation within education to various sub-sectors. The only financial allocation referred to in the draft *Ninth Five-Year Plan* (vol I, p 183) is under the special action plan of the prime minister: Rs 20.4 thousand crore is allocated, as a part of the central outlay. For the centre and the states/union territories as a whole, allocation to social services is made as a lump sum, Rs 1,82,000 crore.[11]

In the absence of any more details on the allocation of resources to education in the Ninth Plan, let us briefly look at the allocations made in current year's annual budget of the union government (Table 2). In the last year's and also in the current year's annual budgets there has been a reasonable, though not a very significant,

Table 3 Union Government Budget Expenditure on Education, Sports and Youth Affairs (Revenue + Capital)

increase in the allocation of resources to education. In the 1999-2000 budget allocation there was a significant increase in the allocation to education – both plan and non-plan, over the preceding year's revised estimates – all by about Rs 1,500 crore, though the revised estimates for 1998-99 are much less than the budgetary outlays for the same year. But the percentage of increase in the plan expenditure is only about half the increase in non-plan expenditure. Compared to the increase between 1997-98 and 1998-99, the increase in 1999-2000 over 1998-99 revised estimates, is rather modest. E g, the total allocation to education in 1997-98 was Rs 4,983 crore, which increased to Rs 6,733 crore in 1998-99 (Table 3).[12] More importantly, the relative share of plan expenditure on education increased from 5.9 per cent in 1997-98 to 6.4 per cent in 1998-99. The latter figure could increase to 6.6 per cent only in 1999-2000

The general need for tightening of the budget, perhaps resulted in reduction in plan expenditure on general education, as non-plan expenditure could not be reduced; in fact, the non-plan expenditure on general education was Rs 500 crore higher as per the revised estimates compared to the budget estimates in 1998-99. However, in case of higher education, there has been big shortfall by about Rs 600 in non-plan expenditure. This seems to have been done mainly by deferring the improvement in salary scale of university/college teachers.

On the whole, the revised estimates for 1998-99 are less by Rs 200 crore in plan expenditure on education, and Rs 450 crore in non-plan expenditure, compared to the budget allocations for the same year. It would be useful to find out the reasons for shortfall in the expenditures, i e, budget outlays *minus* the revised estimates. Though there has been a shortfall in case of both overall plan and non-plan expenditure on education, and the shortfall is higher in case of non-plan expenditure, it is also important to note that a larger number of plan programmes suffered severely in terms of shortfall in budget expenditures. They include non-formal education, district primary education programme (DPEP), vocational education, adult education and technical education (regional engineering colleges and community polytechnics) (Table 4).

Intra-sectoral allocation of budgetary resources, i e, by different sectors and by different items within education (Table 3) reveals certain important dimensions of changing priorities of the government. The growth in plan outlays for elementary education is important, but the increase is very modest. Important items of the budget for elementary education include operation blackboard, non-formal education, free education for girls, midday meals and the DPEP. There is an increase in the total outlay for elementary education to the extent of just Rs 300 crore in the current year, over the preceding year's revised estimates. It is interesting to note that at the same time, there is a decline in the outlay for midday meals by as much as Rs 400 crore.

A substantial part of the increase in the outlay for elementary education – to the extent of Rs 220 crore – in the budget for 1999-2000 compared to the revised estimates for 1998-99, is also accounted by external aid. Among the several externally-aided projects, DPEP is the most important one in terms of the amount of money involved. The contribution of the DPEP amounts to Rs 750 crore in the current year's budget. Other externally-aided projects include Mahila Samakhya (funded by Dutch government) and Shiksha Karmi and Lok Jumbish (both funded by SIDA). In all, externally-aided projects amounted to Rs 827 crore in 1999-2000 (Table 5). It forms 27 per cent of total central plan outlay for elementary education. The increase in the contributions of the externally-aided projects is by 36 per cent

TABLE 5. EXTERNALLY-AIDED PROJECTS IN THE UNION BUDGET PLAN ALLOCATIONS

Note Shortfall: Revised estimate minus budget estimate (per cent) R: Revised estimate; B: Budget estimate.
Source Expenditure Budget 1999 2000, vol I, pp 107-10

between the revised estimates of the last year and the current year's budget estimates This may be compared to the overall increase in the expenditure on elementary education of only 10 7 per cent All this may lead many to warn that the growth in public expenditure on elementary education is largely 'borrowed growth'

In case of secondary education 85 per cent of the budget outlays are accounted by Kendriya vidyalayas and Navodaya vidyalayas All other programmes including vocational education, education technology and computers in schools receive petty amounts The programme of vocational education aims at diverting 25 per cent of the students at +2 level to vocational studies but currently less than 5 per cent of the students opt for these courses Many believe that the programme did not take off due to, *inter alia* scant attention paid including financial resources allocated to vocational education The goals the programme and the persistent neglect continue

Generally and also constitutionally the union government is expected to take care more of higher education and less of school education But in the recent years the union government has been increasingly concentrating on school education particularly elementary education through a variety of centrally sponsored schemes In the current annual budget 65 per cent of the total plan budget outlay for education is allocated to elementary education and less than 10 per cent for higher education There is an impressive increase in the budget allocation for higher education but the substantial part of the increase is in non plan expenditure which might have become necessary with the revision of pay scales of university teachers and other staff

Now let us note priorities given to a few important specific programmes The mid day meals programme launched in 1995 is to gradually expand to cover all children in primary classes in all government and local body schools The number of students benefiting from the programme was estimated to be 9 75 crore Generally it is felt that the programme is very important in not only improving enrolments of children in schools but also in improvement of nutritional and health status of children But the priority seems to be changing In the budget for 1998 99 Rs 1 092 crore were allocated The revised estimates are 28 2 per cent higher than the allocation suggesting the need to further scale up the budgetary allocations But the provision made in the current year's budget is only Rs 1 031 crore, 5 6 per cent less than the outlay made in the last year's budget, and 26 per cent less than the revised estimates for 1998 99

The prime minister has promised to provide free education to all girls up to the college level As a measure of improvement of girls enrolment in schools and colleges this is an important step Accordingly this has been given a priority in the Union Budget Allocation for girls' education was hiked from Rs 100 crore in 1998 99 to Rs 160 crore in 1999 2000 But this amount is not enough to provide really free education to all girls enrolled in schools and colleges While the scheme announced by the prime minister is to cover school and college levels including professional level higher education in the budget allocation is made only under elementary education! Further lest there is any confusion on the concept of 'free education the draft Ninth *Five Year Plan* (vol II p 130) defines it to be free of tuition fees inclusion of provision of basic textbooks maintenance expenditure in hostels and library books There can be several types of fees other than tuition fees Many a time it is found that the other fees are much higher than the tuition fees both at school and college levels So it is not all that free though the term free is wider in scope than free primary education as it provides for maintenance expenditures of the girl students in hostels

The programme of residential upper primary/secondary schools in rural areas to take care of the special needs of migration population and scattered habitations which was allocated Rs 24 crore last year could not take off As a result it seems to have been dropped out altogether

In case of adult education the rural functional literacy project seems to have been closed with no allocation at all being made in the current budget The overall allocation to adult education has however been increased by about 40 per cent

Much of the budget outlay for the national scholarships meant for the poor but meritorious students could not be used As per the revised estimates only 46 per cent of Rs 3 26 crore allocated could be utilised in 1998 99 However in the current budget the allocation has been stepped up to Rs 10 9 crore

How to raise more public resources for education? Recently the minister for human resource development has announced that an education cess would be levied for raising resources for elementary education There is no proposal of this kind in the budget However in the budget there is a hike in the price of diesel by Re 1 per litre It is also promised that half of additional resources generated through hike in diesel price would be allocated to rural development and social sectors, including education What fraction of the revenue would go to education is yet to be seen Earlier also the union government has promised that the some of the savings made through public sector disinvestment programme, and the voluntary disclosure of income scheme (VDIS) would be allocated to human development sectors like education and health One can only hope that a substantial proportion of the revenue now generated would be allocated to education

Summary and Conclusions

As far as education is concerned the Union Budget is an extremely partial one to give any comprehensive picture of public expenditure on education in the country as sizeable expenditure on education is incurred by the state governments For example according to the budget estimates in 1996 97 states met 85 per cent, the union government meeting the remaining 15 per cent of the total government expenditure on education which is a concurrent subject In case of plan expenditure however the share of the union government was above 40 per cent [MHRD 1998] Nevertheless the Union Budget does indicate the direction in which the priorities of the union government are being shaped and it obviously has considerable influence on the development of education in the states With this in view, a brief attempt is made in this article to examine the education priorities of the union government as reflected in the *Union Budget 1999 2000* the *Economic Survey 1998 99* and the draft Ninth *Five Year Plan 1997 2002*

The union government promises to accord a high priority to education making it an important component of NHDI' and also the prime minister's 'Special Action Plan In a situation when the need for strong political commitment to education is being increasingly felt these proclaimed intentions of the union government are certainly welcome But these high sentiments expressed in favour of education are not well reflected in the programmes plans and other initiatives proposed in the Ninth Five Year Plan, the *Economic Survey* and also the resource allocations proposed in the *Union Budget 1999 2000* The only major initiative proposed in the Union Budget is the Education Guarantee Scheme for the poor, which may have major internal contradic-

tions, particularly when it is aimed as a strategy of providing education to the rural poor, scheduled castes, scheduled tribes and other backward classes.

Further, the urgency to check the growth of out of school children is not being felt. The need for making elementary education a fundamental right and the need for allocation of resources for the same is also not clearly recognised. Further delay would only accentuate the problem. Further, it is clear that attempts are being made to interpret universal elementary education to mean only primary education up to fifth standard; and the long promised goal of allocating 6 per cent of GDP to education is being diluted so as to include in it not only government expenditure but also private expenditure including household and other private sector expenditures on education. These do not seem to be good auguries of according a high priority to education.

Notes

1 See Majumdar (1999) for a brief summary of the report.

2 See also Rahul (1999) for a critique of EGS in Madhya Pradesh.

3 One might fear that this is likely to be treated as non-formal education. Note that emphasis on non-formal education has been increased, with the budgetary allocations being more than doubled from the revised estimate of Rs 160 crore in 1998-99 to Rs 350 crore in 1999-2000.

4 One of the important reasons for arguing in favour of the 83rd constitutional amendment of making elementary education a fundamental right, is to see that no scope is left any more to misinterpret the constitutional directive and reduce the duration of the free and compulsory cycle of education to less than eight years.

5 E g, *Statistical Yearbook and World Education Report* (both from Unesco, Paris), *World Tables and World Development Indicator* (both from World Bank, Washington, DC), *Education at a Glance: OECD Indicator* (OECD, Paris), *Human Development Report* (UNDP, New York), even several regional studies (e g, Haq and Haq 1997, 1998).

6 Further, UNDP has estimated several ratios of expenditures such as social allocation ratio, social priority ratio, human expenditure ratio and public expenditure ratio [UNDP 1991] to provide policy guidelines. It is important to note that all these ratios refer only to public expenditures. When UNDP (1992) suggested that the human expenditure ratio has to be raised to at least 5 per cent, it also referred to public expenditures only.

7 The International Commission (1996:165) has clearly argued. "Increasing *public spending on education*, in place of expenditure under other budget heads, should be regarded as a necessity everywhere, and especially in developing countries, since it is a vital investment for the future. As a rule of thumb, not less than 6 per cent of GNP should be devoted to education."

8 Further, since most of the international statistics refer to public expenditure on education as a proportion of GNP (not GDP in general), it would be better we also refer consistently to GNP rather than GDP, though it might not make substantial difference finally in the estimates of per cent of national income devoted to education.

9 See Tilak (1990) for details, which formed the basis for an answer to the parliament question on this issue.

10 It was a little above 4 per cent at the beginning of the 1990s.

11 If we assume that about one-fourth of the total allocation made for the social services is allocated to education, the total (centre plus states) outlay may be about Rs 45,000 crore, of which the centre's share is Rs 20 4 thousand crore; and the states's share would be about Rs 25,000 crore This seems to be a somewhat most likely estimate of allocation to education in the Ninth Plan. Beyond this, one can say little on allocation of resources to education in the Ninth Plan.

12 There are discrepancies between the figures in Tables 2 and 3. This may be due to (a) Table 3 refers to education, sports and youth affairs, while Table 2 refers to education only; and (b) Table 3 may not include expenditure on education incurred by departments other than education.

Households, Kinship and Access to Reproductive Health Care among Rural Muslim Women in Jaipur

Maya Unnithan-Kumar

This article situates reproductive health care in the context of women's perceptions and experiences of illness in general as well as in terms of the material, ideological and political dynamics of household, kin and gender relations. The findings of a study among the Nagori women in Rajasthan yield useful information which would help in the construction of an appropriate health care package for women.

REPRODUCTIVE health[1] practices among Muslim women in india have been little researched perhaps because of the widespread notion regarding the tight Islamic control over sexual behaviour and the sanctions against contraceptive use. A study of the rural Nagori Sunni community in Jaipur district[2] as described in this paper revealed that while it is generally true that Nagori men and women in Sanganer do not in principle entertain the idea of a control on conception, nevertheless at an individual level, this study finds, they seek out health services for sterilisation as well as the medical termination of pregnancies. Most of their possibilities for seeking health care are not so much a function of general religious proscription as related to the organisation of Nagori household and kinship arrangements. The experiences of Nagori women in relation to the health care services were both similar to and different from other rural lower class and caste women in the surrounding villages.[3] For most of these women, the decisions regarding the timing and physical and financial cost of health services sought are closely connected to work and production demands of the household, its assets and resources, the nature of health care services available and the perspectives of the causes of illnesses and the perceived effectiveness of various cures sought.

Women carry more of the work burden of the household and therefore have less time to seek out health care services making them disadvantaged relative to men in their access and utilisation of health care services. Especially in their role as mothers, women carry a greater health burden (as carers) as well as a greater reproductive burden than men in households. The recent gender inequity approach to health [Standing 1997] considers the gender skewed allocation of resources and power in the household as among the critical factors responsible for womens' disadvantageous position within health care system. As feminist scholarship in the 1980s in anthropology and more recently in economics have shown, the household, far from being a 'natural' (biologically determined) unit of members with homogeneous interests, is in fact a site of continuous negotiations, with decisions made through both consensus and conflict [Harris 1980; Sen 1990; Agarwal 1994]. As gender roles and relations within and between households vary from one material, social, cultural and ideological context to another, decisions regarding matters of health care become at once both complex and challenging to understand.

A dominant issue to emerge from Nagori women's narratives of illness has been the negative experience of health care services related to the bearing, birthing and rearing of children. Recent studies have also shown that despite the vast network of health care provisioning in India, the outreach continues to be poor, especially for women [Jejeebhoy 1997; Gittelsohn et al 1994; Pachauri 1994; Visaria and Ramchandran 1997]. The focus on women in health delivery programmes has mainly been with regard to reproduction with an emphasis on the control of fertility. At least until 1994,[4] reproduction has been narrowly defined by the characteristics considered demographically important [see Greenhalgh 1995 for a powerful critique on demographic approaches to fertility]. Few studies on health delivery in india have moved beyond an orientation towards demographic statistics to actively engage with questions of gender, culture and power (the documentation to emerge from NGO activity in the area of health is, however, an important exception).[5]

This paper situates reproductive health care in the context of women's perceptions and experiences of illness in general, as well as in terms of the material, ideological and political dynamics of household, kin and gender relations. It focuses on menstruation and childbirth and local perceptions of the body, reproduction and ill-health. It describes the material and ideological factors linked to the household which facilitate Nagori women's use of health care services. The important role of kinship relationships in relation to health care financing is discussed. The conclusion considers which kinds of women in the household and community are best positioned to play an active role in facilitating women's use of the health facilities provided.

I
Menstruation and Childbirth: Health Needs and Health Care Provisions

For most of the Nagori women in the study menarche commenced when they were between 15 to 18 years old and they had their first child when they were between 17 to 20 years. On average, these women married when they were between 2 to 13 years with the 'gauna' (or consummation) for those who were married below 9 to 10 years, taking place approximately three to four months to one year after menarche. Thus like other rural women in the area – meena, khateek, raigar, rajput, brahmin for example – rural Muslim women are initiated into childbirth at a very young age and quite soon after their first menstrual period. Most of the women in their 30s had also been married in accordance with the local Rajasthani custom when they were children with the consummation or gauna taking place after menarche.

Most of the reproductive problems of rural women in this area of Jaipur district were related to menstruation and white vaginal discharge. Information based on eight months observations of the patients at a voluntary health centre in the area indicates the menstrual disorders ('mahawari/maheena ki pareshani') to be of four conditions: menorrhagia (excessive bleeding), dysmenorrhea (painful bleeding), amenorrhea (absence of bleeding), polymenorrhea (irregular bleeding), with the first and fourth being most common and hardly any instances where medicine is sought for painful bleeding.[6] Leucorrhoea or white vaginal discharge ('safed pani') usually refers to excessive discharge, leading to heavy soiling of clothes, causing discomfort and accompanied by a bad smell. Other related

problems were to do with conditions of pelvic inflammatory diseases referring to the infection of the fallopian tubes, ovaries and uterus including the cervix (often encompassed in the use of the local terms 'ghav', meaning wound, or 'ganth', meaning lump in the 'nalli' or tubes and 'bachchadani' or uterus); prolapse of the uterus, cystocele (bladder prolapse), and rectocele (rectum prolapse) through the vagina, all referred to as 'shareer nikalna' by the women; anaemia and nutritional deficiency (indicated by the general term 'kumzori', or weakness) with most of the women having a haemoglobin level of 8-10 gm per cent (under 8 gm per cent indicates severe anaemia, over 12 indicates a good haemoglobin count); other, such as a few cases of primary sterility (approximately five women in 2,000 who come to the health centre), few with suspected cervical cancer and a few relatively minor cases of breast abscess and mastitis.

While a few cases of maternal mortality came to the notice of the health centre, there was a high incidence of maternal morbidity. This ties in with various statistics on women's health which show a high occurence of maternal morbidity and disease of women in their reproductive life span with a high correlation between poverty and maternal and infant mortality.[7] As is well known, infant mortality is crucially connected to maternal health. High infant mortality figures are recorded in Rajasthan in general. There was a very high incidence of foetal and infant mortality across communities in the area with the highest number of children dying below one year. Twenty three of 48 Muslim women reported 43 infant deaths (25 girls, 18 boys). Twenty five deaths (58 per cent) were among children under the age of five with 21 of these deaths (84 per cent) occurring under the age of one year. There was an equally high incidence of foetal death ('bachchadani mein bachcha kharab hona'). Of 48 Muslim women 19 (40 per cent) reported one to three miscarriages ('safai' or 'girna') of foetuses between two to six months. The most common cited reasons for foetal and infant mortality alike were 'oonpar ki bimari' literally 'an illness of top', caused by an ill wind and tetanus.[8]

As women articulate their health problems in very general terms, it is important to consider women's reproductive health in the context of their wider complaints of illness. Nagori and indeed other caste women used descriptive terms such as 'dard/dukhna' (pain), 'kumzori' (weakness) or 'pareshani' (discomfort) to convey their sense of ill-being. The most frequent general complaints of women, in order of highest occurrence are: (i) pain in the upper abdomen (epigastrium) related to hyperacidity, with nearly four to five out of every 10 women having this complaint. This problems is related to dietary habits and the fact that most women drink only a cup of tea till their midday meal; (ii) dizziness ('chukker') along with loss of appetite ('khana hajam nahi hota'), related to weakness and malnutrition; (iii) chronic cough ('khansi'), a common ailment which they share with men; (iv) fevers ('bukhar') and body aches (especially 'peeth mein dard/kamar dard'), the latter affecting older women more frequently; and (v) others, such as headaches and visual disturbances, seasonal diarrhoea, fungal skin infections and viral fevers. The use of more general words relating to pain, discomfort and weakness rather than specific disease related terms also points to the fact that women perceive their illness as related to causes lying outside the purely physiological domain. Often illness, especially to do with fevers and sudden death or in cases when allopathic medicines are ineffective ('dawai nahi lagi'), is perceived to result from 'oonpar ki hawa' or an ill wind (related to jealousy and tense social relationships within the locality). Such references to the influence of soul and spirit upon a person's health indicates that in local (Muslim and Hindu caste) perceptions the health of the individual and the social body are connected [See Lock and Scheper-Hughes 1996 on three important notions of the body in medical anthropology; and on ethnomedical systems where illness cannot be situated in the mind or body alone precisely because no distinction is made between body, mind and self].

Almost 75 per cent of the women I came across, resorted to spiritual healers for their ailments. Given the fact that the causes of poor health are regarded as lying as much in the social as physical domain, it makes cultural sense to also seek cures from healers other than from the medical profession. The high maternal morbidity among rural Muslim and Hindu caste women was related to a combination of physiological, social, economic and psychological factors wherein marital problems, the social consequences of aborted fertility, poverty and lack of nutrition, the inability to control infant mortality, the lack of information about diseases and effective recourse to cures were only some of the realities which took their toll on women's lives. The government and formal, private health services on offer are as yet ill-equipped to meet the health demands of this nature.

In Rajasthan as elsewhere in India, the provision of health care facilities from a development and macro-perspective lie on government's shoulders. It is the government which has the structure, albeit a rambling one, to effect safe health practices among a wide and disparate population of health-seekers. In Jaipur district, for the rural population, there are 17 primary health centres and family planning centres, 35 dispensaries and three hospitals. By contrast, there are 14 urban hospitals and 15 urban family planning centres. There are 15 mother and child welfare centres. Apart from allopathic services, there are 259 ayurvedic aushadhalay (dispensaries) and three ayurvedic hospitals [District Gazetteer 1987]. Each primary health centre has a number of subcentres depending on the population with each subcentre in Sanganer catering for between 2,500 to 5,000 persons which could include anywhere from two to 11 villages over a radius of one to eight km (personal communication, Sushma ANM).

Women in the Nagori village overwhelmingly tend to use the services of private, medical and traditional healers, rather than government institutions. This is not a surprising observation as Bhat (1993) in his review of the private health care sector in India finds that both in terms of number of hospitals, dispensaries, clinics and number of physicians, the private sector far outnumbers the government sector. The small Muslim clinic in the smaller of the two Nagori populated villages is used for fevers, coughs, aches and pains but the doctor is not regular and the medicine is not effective. Apart from the private doctor in the village there are private clinics in three locations within a radius of 4-6 km. The first location, south-west of the Nagori village is in the railway town which has approximately 10 health centres (nine are private clinics which offer general services, of which one is ayurvedic and one is women-focused. The government also has a primary health centre here). Of these health facilities four including a government primary health centre have at least one doctor with the qualifications of MBBS or MD with four registered medical practitioners (RMP),[9] one vaidya (ayurvedic qualification) and one 'doctor' with simply 'experience' (who has not passed his 10th class). Of the health services available within a radius of 1-6 km, none of the private doctors frequented by the Nagori Muslims offer reproductive health examinations or ante-natal check ups for women. Thus in seeking medical attention

with regard to reproductive health related problems women have to traverse greater distances spending more on transportation costs and involving contact with fewer doctors who know their family contexts.[10] This may explain why women usually seek out reproductive health services only in very serious cases where infant or maternal life is at stake and not for what are regarded as routine matters of childbirth.[11]

For reproductive health services Nagori women go equally to private and government doctors but prefer to see government doctors in private where they are promised greater attention and care. They do try to have a good relationship over a period of time with one or two doctors whose medicine is considered effective ('jin ki dawai lagti hai'), irrespective of the cost of care and distance. Women travel from 8 to 20 km towards the city to seek out these private health services. There is usually a combined resort to allopathic, unani and spiritual remedies. The cures from appeasing afflicting spirits such as those of Sayyed Baba and Ramzani Baba who possess relatives or members of the community, or even from men of the meena and bhangi caste who are possessed, are particularly effective for illness resulting from 'oonpar ki hawa' (literally wind from above or over the body). Usually these are illnesses which have a sudden on-set such as fevers and may be accompanied by abnormal behaviour. There are also Hindu 'jhad phoonk wale' whose services are sought for ailments such as snake bites, body fever and aches and taken along with allopathic medicines. There are few 'jadi booti' or herbal home cures which are followed with any seriousness or in systematic way. Usually, the jadi booti are those prescribed and prepared by the unani doctors. When medicines are taken in such a combined fashion and the result is positive, i e, the patient gets better, the effectiveness ('phayda hona', 'dawai lagna') is seen to result from jhad phoonk rather than the allopathic medicine.

II
Household Context of Health Needs: Work, Time, Food

The sexual division of household labour and further the division of labour among women of the household has implications for women's health at two levels. Firstly, in terms of the actual physical burden imposed by hard and continuous labour with little respite during weakness or illness. Secondly, the continuous daily demands made on women's time makes it very difficult for them to take 'time out' to consult health specialists. This direct and indirect toll on women's health shifts with the development cycle of the household – being heaviest on newly married women, somewhat less burdensome when children become old enough to help (from seven to 10 years onwards) and significantly reduce with the arrival of daughters-in-law. The desire of women to have children, daughters to help at home when they are young and sons to bring in their wives' labour, works significantly towards achieving a reduction in their work burden. In this sense there is a conflation of the cultural notion of having more children (where no active decisions may be taken) and the desire for offspring to meet labour demands (where active decisions to have more children are taken). The cultural and economic factors are further modified according to the overall material situation of the household and the health of its members as I discuss below.

As other rural inhabitants in the area, most of the married male residents of the Nagori village own small subsistence portions of land or have rights in crops produced in the land of their kinsmen (brothers). On an average a household (conceptually members of one 'chulha' or hearth; although there may be more than one physical chulha) which has one main wage earner makes an earning of Rs 1,500 to Rs 2,000 – from outside wages (either from work with semi-precious stones or in the construction industry) and procures three quintals of wheat staple from within the village which can last up to six months depending on the number of people who stay together ('shamil rahne wale'; of one chulha). I have found a maximum of two to three married brothers who line together and one brother living separately, making for one separate household for every three joint households in the village. An average joint household would have a minimum of two to three goats and access to water for bathing, drinking, and washing clothes from a distance of 0-1 km.

Women spend on an average between 10 to 15 minutes to half an hour in the early morning sweeping inside and outside the house. This would include the collection of a couple of baskets of animal dung and feeding the animals. Following this, women spend half an hour to an hour filling approximately four to eight pots of water in the morning, a task which is repeated in the evening (each pot weighs around eight to 10 kg). Women spend anywhere between one to two hours preparing food and make eight-30 rotis for the day (the number varies according to the number of relatives, guests, temporary, additional members of the household). Bathing small children and washing clothes take two hours to half the day but would be done once in two to three days only. Washing dishes also takes half an hour to an hour twice a day. Then there is the work in the fields. Like all Muslim women, Nagori women are proscribed from work 'outside' ('outside' I was told meant beyond the 'ilaka' or locality which included the village as well as a certain portion of the surrounding area). Most middle and lower class Nagori women engage in some kind of agricultural activity which is seasonally determined. The heaviest of the agricultural work for women is the harvesting of the wheat crop (including jowar and gram) referred to as 'lavani' which takes place from mid March-April. There is another round of lavani of smaller crop of bajra, moong, guarfali, cholai during October. Apart from lavani women also weed ('ninani'), water ('panat') and cut ('todna') the crop at other times of the year. Men make bundles and sell the crop which is not earmarked for household consumption. Women and men of the richer households who can afford to lease out their agricultural land do not work on their own fields. If the household is a poor one, i e, there is no steady income by an adult male member then women also perform 'mazdoori' (wage labour) or lavani for money (approximately Rs 40 to Rs 50 per day) on another Nagori or Pathan's fields in the village.

The division of household tasks works in favour of the age of women only if they have younger women to shoulder the heavier tasks (filling water pots, cooking, cleaning, and cutting and weeding in the fields) or if the household is relatively well off. There are usually four categories of women who tend to live together, the mother-in-law ('sas'), younger sister-in-law ('devrani'), elder sister-in-law ('jethani'), and the husband's sister ('nanad') if she is unmarried. The task of preparing food, bringing water, cleaning utensils, sweeping and cleaning are usually shared among the sisters-in-law. It is common to find a rota of work among the younger women so that when one cooks the other will sweep and fill the pots. There is no sharing in the rearing of their respective children although occasionally small tasks such as dressing the children may be shared. The main work of the sas is to attend to the younger children nevertheless babies from six months upwards may be entrusted to the care of elder siblings (both boys and girls), while women complete domestic tasks and do small errands or odd jobs in the village

While some sas do indeed perform few household tasks, many because they live in joint households do a lot of household work especially when the younger women are sick or indisposed due to childbirthing, both of which occur frequently. In fact most younger women mentioned their mothers-in-law as co-workers rather than as shirking work.

One of the common work burden related physical ailments which Nagori women suffer is of a prolapse of the uterus. Mehmuda, the Pathan 'dai' is 65 years. She has given birth to eight children. She said her uterus was protruding 1.5 inches at present but 25 years ago it projected about four inches outside her cervix. She said that when she was three months pregnant at the time of her third child she had lifted a bundle of approximately 40 kg and immediately felt her uterus give way. At that time she consulted a private lady doctor in the city who inserted a rubber ring but Mehmuda discarded it as she felt uncomfortable "mein bechain ho gayi aur usko nikal ke phenk diya". Mehmuda also tried some herbal medicine (extract of the Bodjadi bush) but nothing worked and she just lived with it. In fact most women I talked to considered a prolapse of the uterus more as a condition to cope with and manage rather than treat. They also did not seek treatment due to 'sharam' (shame), the absence of knowledge about effective cures and the fear of termination of their fertility. While I was told that a lifting of heavy weights was not proper during pregnancy yet all the women I saw in the last stages of their pregnancy both carried pots of water, bundles of weed and fodder as well as performed tasks such as lavani involving arduous labour in the fields. In reality women were careful with heavy weights for 10-30 days after childbirth. The number of days depending on (i) the presence of household help, (ii) the stage of the development cycle the household was in, especially the number of children to cook for and feed, and (iii) the seasonal work and food stocks of the household.

The weakness of mothers and infants is largely due to their under-nourishment and connected with little emphasis on the quantity and nature of the dietary intake of mothers during pregnancy and after childbirth. Nagori women ate no differently in quantity or type of food during their pregnancy compared to what they would eat under normal circumstances. This means they would have a cup of tea in the morning, approximately one to two rotis with one 'katori' (small bowl) of cooked vegetables or chutney or chilli; onions and one katori of buttermilk/dal or lentils at mid-day and the same at night. Most men were unaware that women needed any supplements to their food or even respite from work during their pregnancy. A few women mentioned that it was a good idea to eat 1/4 kg to 1 kg of 'khopra' (desiccated coconut), 0.5 kg urad lentils and up to 1.5 kg of sesame seed oil in the eighth month as these are 'chiknasi' (lubricating) foods which would help the foetus move easily within the womb to ensure a smooth delivery. Almost all women reported having some special food after childbirth but the quantities were little and the duration was on an average up to 20 days after delivery.[12]

Very few women mentioned the consumption of large amounts of fluid or eating greater quantities of food than in their regular diet. An important difference between food consumed following childbirth and regular food is that the former is freshly prepared each time (apart from the 'ladoo', see footnote above). As the new mother ('jachha') is prohibited from touching the hearth and the water pots due to pollution ('gandagi' – dirt) following childbirth (for a period of up to 40 days), she is dependant on other women to feed her. Either her mother-in-law looks after her or a 'sister-daughter' has to be called over. It is the availability of these other women which determines the type, quantity and duration a new mother gets fed. At the very least, I was told somebody looks after her for two to four days.

Thus it is not so much an equitable distribution of food in the household which is in question as the fact that women deny the food to themselves. This fact points to the important role of gender ideologies in the inequitable distribution of resources in the household and its implications for women and children's health. The notions of 'good' and 'bad' breastmilk are an important example of the role of gender ideologies in determining access to nutrition or its denial. According to Zahida there are women who can be differentiated according to the milk they produce and the evidence of this lies in the fatness of the baby relative to the mother. "Jab mota bachcha aur dubli aurat hoti hai tho doodh acha/phulna hota hai. Jab patla bachcha aur moti aurat hai tho doodh katna hai." (Breastmilk is of good quality when the baby is fat and the mother thin and not in the opposite case). Such notions also pressurise women to be thin and consume less of food and especially fluids, so vital for milk production and general well-being. A generational factor could also be significant. Most older women claim to have had enough breastmilk to raise all their infants. Zahida's mother for example, said she had plenty of breastmilk and fed her children exclusively on breastmilk. Many of the older women also ascribe poverty to their inability to provide different kinds of food (biscuit, milk) and therefore rely solely on breastmilk to feed the children.

Women themselves did not consider it important to change the type or quantity of foods during pregnancy or lactation. A number of women said they were incapable of ingesting much food under normal circumstances as well. This may very well be the case as in anaemic conditions, due to a reduced oxidation of the body, there tends to be a loss of appetite. But as one woman pointed out, this could have its roots in childhood eating habits. Also, women were afraid to become fat as this would invite comments from other women that they were not working enough. Compared to the women , men in the household ate the same food ('roti-subzi') but in greater quantities, with greater regularity and before rather than after physical labour.

III
Kinship and Finances in Access to Health Care

The inevitable preamble to any conversation on relatedness amongst the Nagori Sunni Muslims is, "all Muslims are one; we are all one". Caste type differences, however, emerged in discussions on marriage preferences. Most women were aware of four to five different groups into which they could marry, including their own (father's) group. Most women in the Nagori dominated village fell into eight such groups and there were a further six groups whose names were mentioned. The common 'gotra', clan or sub-subcastes were sheikh, irawat (both upper), lalawat, khokhar (lower), raksha, samavat, ladawat and rav. There were a few pathan households in the village. Sunni Nagori women were quite clear that they married their father's sister's son (FZS: in the 'phoophi' category), mother's sister's son (MZS) or a variant thereof (for example, Zahida is married to her mother's father's sister's son). Married Sunni women were not only socially close to their natal kin ('piyar') but also physically close to them. In most cases women's married home ('sasural') was within a radius of one km to four km from their natal home. There were few women whose married home was further on (within a radius of 40-50 km). The social and physical proximity of natal kinspersons has important implications

for Nagori women's access to health care services in at least six ways, viz, (i) in the organisation of money to pay for health costs, (ii) in arranging for women or men to accompany patients to health care centres, (iii) in the provision of help with child care for a sick mother, (iv) in the provision of help with domestic tasks while the woman is away, (v) as a means to reliable information on health care facilities, costs, locations etc, and (vi) for emotional support as often medical experiences are traumatic and degrading for women.

On an average the expenditure over 10 months on the health of women alone is from Rs 1,000 to 10,000 which is very high considering that the average monthly cash income of the household is Rs 1,500 to 2,000. None of the households contacted had any specific sum set aside to cover illness expenditure of family members. All expenditure on health was crisis expenditure and reached high sums because treatment was delayed till the problem was acute.[13] Money to cover health costs came from two main sources – kinspersons or unrelated moneylenders (employers, silver smiths, local people dealing in this business). The money is borrowed at a rate which is currently between Rs 2 to Rs 5 per Rs 100 and used for all kinds of household expenditure with a larger portion being spent on health. Most households spend substantial sums of money on health care services from private sources compared to the income earned.[14] Most families who do not have more than one regular income earner are therefore permanently indebted, rising or falling in small cycles of debt. When the debt reaches a very large amount (in the region of Rs 40,000 and upwards) and a difficulty in repayment is envisaged, due to, for example, crop failure or further illness crises, then drastic measures such as the sale of a portion of land, highly priced in the area is resorted to. Being in debt of up to Rs 10,000 is such a normal condition that debtlessness does not seem to be actively desired perhaps because it is not achievable in practice. The role of kinspersons looms large in meeting health care costs.

Most Nagori women utilise the services of a private lady doctor for problems relating to menstruation, pregnancy, fertility and childbirth despite the large sums of money involved relative to the household cash income (very rarely are non-reproduction related problems of women given as much attention or financial outlay). If there is bleeding during pregnancy, usually the outcome is to get safai done by private women doctors who charge fees from Rs 400 for foetuses of 2-2.5 months to Rs 600 to Rs 800 for foetuses of four to five months. Including transportation and medicine, women spend approximately from Rs 500 to Rs 1,500 for a medical termination of pregnancy (MTP). The facility for MTP as well as sterilisation is provided free of cost in government hospitals yet there is less resort to these services because (i) of the belief (and practice of at least one government hospital) that women be sterilised at the same time so government utilities are not wasted on continuously aborting the same woman's foetuses, (ii) of the practice of government gynaecologists who prefer to see patients in private as they claim they are able to give patients more attention at home, (iii) at government hospitals there is the expenditure on medicines which have to be bought from elsewhere, for urine, blood and other tests patients are advised to go to private laboratories for speedy results, and there is an unauthorised charge made by hospital personnel (sweepers, washerwomen) for any services requested from them. The resort to safai proves far more effective than the prevailing contraceptive options presented to women which are neither culturally acceptable (like nirodh; only two young couples used nirodh) nor physically acceptable by weak bodied women (intrauterine devices such as the Copper-T and even hormonal pills can cause excessive bleeding in weak and anaemic women). Sterilisation (locally referred to as 'operation'), a possible but difficult to reverse process, is the most viable option for women but resorted to only when the desired mix of girl and boy children are attained (four to five children with two boys and two girls). For many women conceiving the desired number of girls and boys takes them up to their menopausal stage in the reproductive cycle.[15]

On the subject of financing health care costs, Madari Khan assured me Muslims do not borrow from amongst each other but only take money on credit from moneylenders of other castes, especially, the meena in the area. Zahida, however, gives me a different picture of credit networks. She says the difference between borrowing from relatives ('rishte wale') and non-kin is that there is no interest to be paid to one's relatives. Also, the amounts which can be borrowed are smaller and range from a few hundred rupees to a thousand or two rupees. Her main source of credit is Maraim, her elder nanad (husband's eldest sister) who lives in the village. Maraim gives Zahida credit of up to Rs 2,000 from whatever money she has. For greater amounts, say of up to Rs 10,000 Maraim gets money for Zahida from persons who can lend this amount ('paise dene wali' party) In case Zahida is unable to return the amount on time, she says Maraim will cover for her and give back the money borrowed. Women in the nanad category are thus important sources of funding. A woman's nanad also helps her during childbirth, with cleaning and washing, her important role is acknowledged in the Nagori custom whereby she offers the mother's breast to the newborn infant for its first breast-feed.

The relationships between children and elder women which stem from ties established through breast-feeding place kinship obligations (including to meet financial requests) on the latter which are difficult to refuse. Although not a very frequent practice, there were several women who had breast-fed their younger sister or sister-in-law's children. Most women stressed that this was a practice only for the children of women you were close to in kin terms as there is the fear that if the child falls sick the blame would fall on the woman who had breast-fed it. There is a custom called 'doodh buksna' whereby boys pay money (Rs 21, 51 according to their means) to the women who have breast-fed them, when these women are nearing the end of their lives. The money is then distributed among the women's daughters. Mothers and daughter's have a strong tie in the Muslim community which is also reflected in breast-feeding patterns. According to Mehmuda, girls are breast-fed for six months longer than boys because they have a stronger right over the mother (*'ladkiyon ka maa ke unpar zada haq hai'*) and girls always take from their natal kin ('ladki to piyar walon se hamesha leti hai'). Zahida says as a daughter she gets the goat's head (a delicacy) when a goat is sacrificed on Bakri-Id at her natal home. She told me how despite her negative experiences of childbirth (recounted below), she was pleased to finally get a daughter. Her story is also an account which makes us consider the role women have in the decisions surrounding childbearing and birthing.

Zahida's Story

Zahida got her first period when she was 13 and in her natal home. She was married at 14. One year later she conceived her first child but was totally unaware of this. Her period stopped but she did not tell anyone about it. When she was in her ninth month she became very sick and could no

walk – then her mother, father and father's sister came to see her. Her mother saw that her breast was leaking and told Zahida that she was pregnant and then called a midwife. The midwife said Zahida could have a child at any moment but she should not have her child in her married home as it would be dangerous for both mother and child. Zahida could not go to the bathroom, she could not see, could not hear, her body was swollen and she had little help or sympathy from her husband or in-laws. Her father said they would take her home. Her husband became angry and tore her father's 'kurta' (shirt) and dhoti. He said if she dies, she will die here, I am not sending her. Later, her 'jeth' (husband's elder brother) intervened and said to his brother that you bring her to the city and I will show her to the doctor. Then her husband and husband's sister tied her with a rope as she was too weak to sit up and put her on the cycle and took her to the government women's hospital. The doctor admitted her and asked her husband and his younger sister who they were. They said they were Zahida's neighbours, that she had no kin and that her parents were no longer alive and her husband stayed outside Jaipur. According to Zahida, they lied because they were scared and besides her husband's sister had been told by her in-laws not to say anything, to let her brother do the talking, otherwise she gets on well with her sister-in-law. Zahida was left alone in the hospital where she was treated for 15 days and she had a son of 1.5 pounds who "was like a rat" ('chuha jaisa'). Zahida stayed in the hospital for another 15 days and the child was kept in a machine (incubator). She also received two bottles of blood from a 'rickshaw walla'. Her jeth paid him, she does not know how much. Her jeth did so much for her. No one came to meet her from her sasural, not even her husband, not even after the child was born. Once her jethani came, and others from her mother's house. When she was discharged a month later, she travelled home herself, no one came to collect her. Her husband was ill. There was nothing to eat at home when she returned. Her mother sent 20 kg of wheat, her nanad (husband's younger sister) gave her some 'thooli' (broken wheat daliya). This she roasted and boiled in water and ate – she had no ghee, no milk.

Zahida did not conceive for another seven years. Her in-laws said she could not conceive and told their son to divorce her. Her husband kept her son, hit her and sent her back to her 'piyar', where she stayed for two months. The meeting of elders called subsequently decided that because Zahida was a good woman, her husband must be forced to take her back. Zahida then sought medical advice from a private infertility specialist. She became pregnant but the specialist said the foetus was not growing. Somebody in the village said it was because of 'oonpar ki hawa'. Then she sought help from a man of the meena caste who became possessed by Bhairu (bhairu bhav), got a 'tabeez' (charm) made, got 'jhadan' done and wore a 'kada' (amulet) on her right upper arm. She continued to take the specialist doctor's medicine and advice whenever she had some money. She also saw a 'bhangi' and got a thread to wear around the neck ('gale ka dora'). When she was five months pregnant she had a lot of while vaginal discharge ('safed pani'), and went back to the doctor specialist who recommended a sonography, gave medicines and then she became better. The baby (son) was born at home. A third son was also born at home as was her fourth son after a gap of a year. The fifth child (also a son) miscarried at five months as a cow hit Zahida and its born ruptured the uterus. She bled for three days at home without treatment. When the bleeding did not stop, she sent her son to call her mother. Her mother took her to the government women's hospital. The doctor said the baby in the womb was dead since 48 hours and refused to take up the case. Zahida was removed from the bed but she insisted on help and treatment. She was not attended to but stayed there for five days – "I was almost dead. I was completely blue." Then her jeth came to talk to the doctor (her jeth had given her the phone number but she did not know how to phone and no one was with her) and insisted that she be treated. On the doctor's refusal, her jeth threatened to bring judicial proceedings against the doctor but to no avail. Then they contacted 'Neetu', a private doctor who had treated other women from the village. She said she would look at Zahida but took no responsibility if she died in her care. Zahida was admitted and an MTP was performed (safai) and she received blood. She said she felt dead and was unconcious most of the time. One of the doctors even proclaimed her dead. Her natal kin got things ready "kabr khod liya, kafan laa diya' (they dug her grave and brought the covering cloth). Her husband also started beating his chest in the hospital. Then Neetu came and saw a flicker in Zahida's eyes. She ordered for oxygen to be given. Zahida said she was put into a 'machine'. The next day she became conscious and her jeth told the village people she was alive.

Some Rs 7,000 was spent at the private hospital. The money was taken on credit and repayed at a rate of Rs 700 per month (totalling Rs 8,400). Two years later the twins were born at Neetu's clinic at home. The bill came to Rs 15,700 of which Rs 3,700 were arranged from the household resources (the TV and a goat were sold) and Rs 12,000 was taken on credit from a brahmin, to be repaid within 14 months. Zahida uses the copper-T since then. She has finally got a girl and wants no more children. The Copper-T is giving her pain but she cannot remove it for fear of becoming pregnant again. She wants to get operated but does not know exactly when. She says her husband is useless because he does not work and somehow she has to feed the children. He also beats her. She says he is a good man because he lets her go where she wants.

IV
Women's Agency and Health Care

In his study on the relationship between agency and fertility, Carter (1995) points to the small but growing body of evidence which suggests that even in pre-transition, high fertility and high mortality populations which are considered to be characterised by natural rather than controlled fertility, certain strategies are operative which effect a balance between household personnel and resources.[16] Control over the duration of breast-feeding and controlling intercourse are some of the examples cited by which couples schedule conceptions. Nagori women, I found, also can directly control conception by opting for (i) foetus extermination (safai) rather than foetus saving techniques, (ii) by resorting to sterilisation and, (iii) indirectly by regulating the duration of breast-feeding. While Nagori women have greatest control over breast-feeding compared to safai and sterilisation, they do not make a direct connection between reduced breast-feeding and the resumption of menstruation (or the ability to conceive). In fact they believe the reverse occurs, in other words, because they conceive, breastmilk production declines. Moreover, their control over breast-feeding is compromised by their weakness and malnutrition, as I discuss in the following lines.

With regard to breast-feeding, I have found that mothers' decisions made at two stages, one early on and one later, crucially influence the termination of post-partum amenorrhoea as well as the survival chances of the new-born child. All Nagori mothers claim to breast-feed girls for 27 months and boys for 21 months as stipulated in the Koran, yet there is a great deal of

variation (on average the tendency is for girls and boys to be breast-fed till the age of 18 months or so). In the first six months, observations show that Nagori infants do not get exclusively breastfed. The infant is first put to the breast on an average of 24-48 hours after delivery. As breast-feeding can commence only after the 'ajaan' or words of allah spoken in the ears of the new-born by a learned man, the infant's access to breastmilk depends on the availability of such a person and on the urgency with which he is sought. The NFHS also points to the delayed receipt of breastmilk and the custom of removing colostrum as factors contributing to infant mortality. Although it is true that the Nagoris consider colostrum ('keela' yellow straw-coloured first milk with essential antibodies for the infants' immune system) to be 'bad milk' as it has been 'stored for a while' and therefore it has to be removed, in reality only a few drops are squeezed out by the nanad (HZ) and so the baby does receive some of the benefits of ingesting colostrum even if in reduced amounts. But perhaps what is more debilitating to the infant's health and to the mother's health is the practice of bottle-feeding with a mixture of goat's milk and water, from as early as four to five days onwards. In these instances the mother is either working in the fields or more often says she does not produce enough milk. While generally suckling the breasts should stimulate milk production, in weak and malnourished mothers this may not be the case (Banerjee, personal communication). Here the line of difference between taking an active decision (where the mother continues to breast-feed even though there is less milk) and the decision not to breast-feed because of the absence of milk, is a thin one. Then there are also the Nagori notions of 'good' and 'bad' breastmilk which come into play.

Given the patriarchal, Muslim setting in which child birthing takes place, it is difficult, especially for young women, to exercise reproductive choice.[17] Shakila has a daughter of four years and a son of two years. A week or so after she missed her period she sought out the lady doctor at the voluntary centre to know if she was pregnant. She said she did not want a child so soon. A couple of weeks later when her pregnancy was confirmed she began enquiring about safai. Her 'tai' (her father's elder brother's wife) who accompanied her said it would be alright provided she asked her husband. Shakila did ask him but said her husband wants her to have the child. He is a great 'namazi' (scholar of the Quran) and would not hear of safai. He did not even allow her to take any 'takat ki dawai' (medicine for strength). Shakila says she will now go ahead with the pregnancy but she comes regularly for takat ki dawai and has had her (TT) injections.

Women were quite open in talking about the 'operation' (sterilisation), both as something they wanted done or as having undergone it. When I recounted a story I had heard to a group of Nagori women, that women who underwent sterilisation before conceiving all the children written in their destiny would be troubled in their coffins by these unborn children, the women laughed. Jabunnisa scoffed and said, "who is there to check on what happens in the coffin!" The decision to undergo sterilisation is one of the couples rather than the women alone and thus depends on men's attitudes as well. Several Nagori men, unlike Shakila's husband, have had a positive attitude to sterilisation either having undergone it themselves or have encouraged their wives to be 'operated'. When I point out the proscription of the Koran on the subject to the men, they point out the problems related to their wives' illhealth or their poverty as forcing them to take such decisions. Nagori women's agency must also be seen in terms of the different attitudes and social hierarchies (especially of poverty and Quranic education) which exist between men. It was often the case that men who were well versed in the Koran and read it daily placed greater strictures on their women as a means of differentiating themselves from other men in the community.

Much of the recent demographic literature has been on the impact of schooling and employment on women's powers to take autonomous decisions regarding their fertility. Yet as Jeffrey and Jeffrey's study of Muslim Sheikh women in Bijnor, UP suggests, that while there is a correlation between lowered fertility and women's schooling experience, and work outside the home, it is not always so (1997: 121).[18] Eight women from approximately 200 Nagori households have had formal non-religious education of up to at least the fifth class. On the one hand, there is Shahnaz who along with her husband is one of the two young couples who use nirodh. On the other hand, in the same set of young women, there is Shakila who would like to have an abortion to space her children but who cannot do so because of her husband's wishes against it. Then there is Zahida who has had neither a Quranic nor any other education, is relatively poor and uses the Copper-T. This would suggest that schooling and employment are only two among a number of individual household specific factors which have to be taken into account in understanding reproductive health seeking behaviour. The material on Nagori women emphasises the fact that the extent to which they can be active agents in health care matters depends, apart from their own motivation, on their physical condition (with weakness acting as a constraint upon their activities), their vulnerability to cultural notions (which especially young and first time mothers are prone to), their age, household relationships especially with the husband and the women in his family and the interhousehold (piyar-sasural) connections. Thus any discussion of agency, however, nuanced, can only be partial.

V
Conclusions for Policy: Enhancing Access and Responding to Health Demands

The task of enhancing reproductive health service outreach in the villages around Jaipur lies at many levels which address not only the question of access to existing services but also the provision of facilities which take into account the context specific, gender and age health needs of the local populations. With regard to the rural Muslim community in north-east Sanganer, it requires that preconceived notions among health service personnel regarding beliefs such as the uncontrolled fertility of Muslims and a consequent low demand for reproductive services be surmounted. Religious and cultural differences between the Nagori Muslims and caste groups in the area while they are significant as markers of identity are less important as far as their reproductive health perspectives and needs are concerned. The main cultural difference which lies in the pattern of Nagori marriage and residence of adult women works mostly in favour of facilitating women's contact with health care functionaries. And, Nagori women, as mothers, mothers-in-law and elder sisters-in-law are more able to support younger women, in material, emotional and work terms when they are ill. The only other custom which sets the Muslims apart from other communities in the area is to do with their practice of male circumcision, which can make infants doubly vulnerable to the dangers of tetanus infection (the first instance arises from the possibility of contracting tetanus following the cutting of the umbilical cord). Nagori Muslims have neither more wives nor more children than other groups in the area, nor have

significantly different notions as to the causes and effective cures for illnesses. All groups seem to share an approach to health and reproductive health in particular wherein mind, self and the social body are combined rather than separate, and where sickness is as Lock and Scheper-Hughes (1996; 53) put it, "a form of communication through which nature, society and culture speak simultaneously". There is thus a common tendency to first seek out health services which are organically connected to the social body (such as 'family' doctors, those who have treated other members of the family, or those who heal through spirit possession, both Hindu and Muslim). Medical approaches are generally regarded as important but alien precisely because the treatment is clinical, separating social cause from physiological consequence. Tubectomy which is dominant in the medical discourse on women in Rajasthan and elsewhere in India, points to the extremes to which there is a medicalisation of women's bodies.

Most villagers in the area tend to seek private rather than public health services with a significant amount of household income being spent on treatment. Because of the large sums on money which may be inolved, treatment cannot be sustained for long periods and is discontinued the moment there are any signs of the patient getting better. Women's reproductive ailments, particularly if they are in their child bearing years, tend to receive more immediate attention than reproductive problems among adolescents or in elder women. This is because men as husbands also give greater importance and value to the reproductive capacity of women. In general, there is great reticence in talking about reproductive ailments between men and women as well as among men. Usually reference to sexual and reproductive processes between members of a household is made indirectly. Similarly, reproductive illnesses are resented indirectly which is why problems considered shameful, such as vaginal discharge, or 'natural', such as related to breastmilk production, or those which women are meant to cope with such as a prolapse of the uterus, tend to remain 'invisible'. It is only when women and men are listened to, and encouraged to talk rather than being talked at, that any delivery of health care can be effective, sustained and meaningful. A large number of health problems in the area stem from the lack of adequate water supplies and a preponderance of sand and dust in the environment. As one woman said "humara mitti ka kaam jyada hai" (our work and lives are dominated by sand). Hence health programmes need to be broad-based, so that they help tackle the wider sources in the environment from which diseases stem.

Improving women's access to existing health care services in Sanganer requires both general and specific measures. There are many recommendations pertaining to health sector reforms in developing countries and in India which are equally applicable here [Singh and Gupta 1997; Bhat 1993; Kothari 1989; Pachauri 1994; Jejeebhoy 1997; Ramachandran and Visaria 1997; Standing 1997, to name but a few). At the risk of repetition, I will outline a few points which emerge forcefully from the specific observations made in the paper. As health care is sought from a number of sources, even for a single illness, access can be improved by encouraging all types of health delivery activity, private, government and NGO, in a manner which recognises their specific strengths and weaknesses. So, for example, private health services while they are efficient and attentive to patients' problems, need to be made accountable in terms of the doctor's qualifications and with regard to the safety and ethical nature of the services offered. The government medical services, on the other hand, have to be made more sympathetic and more efficient. According to Jejeebhoy (1997), two reasons for the insensitivity of the services to women's needs and situations are because the services are designed centrally and based on demographic targets. Moreover, maternal health activities are unbalanced, focusing on immunisation and the provision of iron and folic acid rather than on sustained care of women or the detection and referral of high risk cases. Jejeebhoy emphasises the need for a greater client focus in a health and family planning programme which responds to women's requirements. Such a perspective could provide more and better services at home and involve a sympathetic and culturally sensitive probing of health problems.

In order to establish an effective referral network, I would suggest that as is the case with the government 'anganwadi' (childcare) schemes more emphasis should be given to locating and resourcing women and men within each village who are not just informed about matters of hygiene and basic medication such as the ANM or Jan Mangal couple but also about local health services (facilities, distance, cost, qualifications of doctors), health rights and statistics and the politics of health matters in general. Health workers such as ANMs should be committed women and men from among the local population and resourced in such a manner that their job gives them status in the area. This would enhance communication with the local elite as well as with men as husbands and kinspersons. Local health centres (at the primary and sub-centre level) need to compile basic health data pertaining to their area in order to be appropriately responsive to the household nature of health demands, an area where NGOs are particularly successful, precisely because of their local relationships built upon trust and their household knowledge which enables them to assess and react speedily to local situations [Ghosh 1994]. Government medical services need to be more transparent about the costs involved in meeting patients' health needs, and be more efficient through a 'trimming' of resources. One area where the input of resources compared to output in terms of patient utilisation is imbalanced is strikingly evident in the disproportionately large number of ayurvedic dispensaries. In this case, trimming could allow that funds be transferred to use in providing other health care services within the hospital. Government health care in the 'zenana' (womens') hospitals could be more effective if attention is paid to the customer friendly side of their services with perhaps the appointment of a welfare/liaison officer who is available to inform, answer queries, and present cases to the doctor.

There is no doubt that the villagers in Sanganer want and need access to good health care services as is reflected in the high costs they incur as well as the distances they travel to seek out effective health cures. At the same time most of their experiences with the health services on offer have been negative, and given the exacting nature of their lives, women especially have a tendency towards inaction as far as seeking treatment for illness is concerned. At the same time, given reliable information about effective cures and doctors, women are quickly willing to explore the possibilities of seeking treatment from these sources, provided they have some support from their kinspersons to do so.

Notes

[A somewhat different and longer version of this paper was presented at the VIIIth National Conference of Women's Studies, Pune, June 1998 in the subtheme on 'Women's Autonomy and Reproduction'. This appears as IDS, Jaipur working paper no 103, September 1998. The fieldwork on which the findings of the paper are based was made possible by funding from the Wellcome Trust, UK and encouragement

from Hilary Standing, Ursula Sharma and David Robinson. I would like to thank IDS, Jaipur for their hospitality from October 1997 till September 1998. Special thanks to A K Banerjee and staff at the Khejri Sarvodaya Health Centre, Gerda and Narayanan Unnithan, Vipula Joshi, Mohan Singh, Zahida bano, Kamlesh Gogaram, Kavita Srivastava, Shail Mayaram, Surjit Singh and K R Vasanthan for their help and support.]

1 The term reproductive health is used, following the definition used in Gittelsohn et al (1994) to mean that people have the ability to reproduce as well as to regulate their fertility safely and effectively; pregnancy and the outcome of pregnancy are successful in terms of maternal and infant well-being, including the child's development to its full potential; and couples are able to understand and enjoy their sexuality, free of the fear of unwanted pregnancies and of contracting disease (8, 1994).

2 Jaipur district has a rural population of 2.8 million persons (of a total of 4.7 million people) living in a little over its 3,000 villages (1991 Census figures). The work was carried out in Sanganer tehsil which has a population of 8,404 Muslims out of the 3,81,214 Muslims in the district as a whole (1991 Census figures on religion). The material presented in the paper is based on two Sunni, Nagori Muslim dominated villages in the north-eastern part of the tehsil, which together have a population, roughly estimated by me to be around 5,000 Muslims. As a researcher I was based at the Khejri Sarvodaya Voluntary Health Centre in the area.

3 The material presented in the paper is part of a wider project which is concerned with women and men's access to health care services in three villages and one urban slum in Sanganer/ Jaipur. All the villages mentioned in the paper have recently (since 1994) become part of the urban municipality; however, there has been no perceived change in the villagers' lifestyles and for all purposes they regard themselves as rural in contrast to urban people 'of the city'.

4 The international conference on Population and Development held in Cairo in 1994 is significant for its orientation towards sexual and reproductive health rather than population growth which in turn has been responsible for a shift in international and national policies, away from a narrow focus on fertility control.

5 See for example, newsletter and material produced by Chetna, Ahmedabad or the Anubhav case studies [compiled in Pachauri 1994] or the self-help training manual *Na Shariram Nadhi* supported by Asmita [Sabala and Kranti 1995] women's resource centre as also Pal 1997 for empowerment work in slums in Jaipur.

6 The assistance of A K Banerjee, director of the voluntary health centre, with the technical, medical information presented here is gratefully acknowledged.

7 South Asia is thought to have the highest maternal mortality rates in the world [NFHS-India) with 27 per cent of all maternal deaths occurring in India [Unicef 1991]. The Indian average maternal mortality rate is estimated at 437 deaths per hundred thousand live births (NFHS-India: 1992-93) for two years preceding the NFHS survey. Due to large sampling errors, no figures could be made available for individual states or population subgroups (1995, 226). In India, maternal deaths account for 10 per cent of all deaths among women in the reproductive age and 13.2 per cent of all deaths among rural women were maternal deaths in 1987 (Unicef 1991). The main causes of death have been identified as due to haemorrhage (16-22 per cent), toxaemia (10-12 per cent), sepsis (8-13 per cent), abortion complications (10 per cent), anaemia (17-25 per cent) [Registrar General 1987, as quoted in Jejeebhoy 1997]. There is an equally high presence of reproductive morbidity, obstetric and gynaecological, especially to do with reproductive tract infections [for example, Bang and Bang 1989].

8 Information on male circumcision ('musulmani', 'khatna, sunnat banani') revealed that only in very few cases did an infection develop which was then contained. Although if one considers the periods of high infant mortality with the preferred periods when circumcision takes place, a correlation does seem to arise. Circumcision is done preferably in the first to third month after birth or in the second or fifth year. Moreover, there is an added risk of tetanus infection as the foreskin which is held in place by a bamboo shaft, is cut by a blade or scissor. However, the deaths due to tetanus reported by the women were all believed to result from the cutting of the umbilical cord ('olnaal ki nalli' tube of the placenta) rather than due to circumcision.

9 The RMP qualification is available to anyone who fills in an application for a small sum. No attested documents are required to be sent and there is no check on the actual establishment or quality of the practice.

10 Since the last three years, with the opening of a voluntary health centre close to the Nagori village women have also the option of using the services of the gynaecologist at the centre. Three times as many women use the centre compared to men (the men are mostly older men). Women tend to come together and bring sick children, girls and boys, with them On an average 450 patients visit the centre each month.

11 According to NFHS findings, in Rajasthan infant mortality rates fall from 76 per 1,000 births with no care, to 71 per 1,000 for births with either antenatal or delivery care, and to 45 per 1,000 for births with both antenatal and delivery care (1995:137).

12 For the first few days after delivery, mothers drink milk (1-2 glasses to half a kilo each day) and once a day eat a small proportion of 'healthy' milk enhancing ('doodh badhane') foods such as coconut or khopra (upto 1/2 kilo), asafoetida (1/4 – 1/2 kilo), thuli (broken wheat porridge with lentils), molasses, clarified butter (between 2-5/6 kilos) mixed in either milk, wheatflour ('maun ki roti'), seera (weak wheat flour porridge), halwa (wheat flour sweet-meat) or a mixture of these ingredients in the form of a ladoo (sweat-meat ball). Some women also mentioned sonth (1/4 kilo) and almonds (1/4 kilo). Only a couple of women ate an egg for 2-4 days and one or two Muslim women mentioned eating meat, especially goat's head believed to strengthen the infants' neck through the breast-feed. At approximately two weeks after child-birth, the foods ingested were 'thuli', 'khichdi', 'halwa', with roti-dal for at least one meal and 20-30 days afterwards regular food was resumed.

13 For a number of cases where problems were long-standing, usually non-reproduction related, treatment was sought in intermittent periods and stopped the moment the patient was better for a while.

14 This observation is similar to Bhat's findings that the spending on health care as a proportion of total consumption is quite significant, with a larger proportion of the expenditure borne by the household sector rather than the government (1993:48). Furthermore, as Bhat observes, there is no indication that the high costs have discouraged the use of private facilities in favour of public facilities

15 One of 47 Nagori women currently uses the Copper-T or any IUD, five of the 47 women were sterilised (two had husbands who had undergone vasectomies); each has four to seven children of the desired mix and are aged between 30-40 years. Two other women have consulted a doctor about an 'operation'.

16 For a discussion on agency see Dissanayake 1996, Carter 1995, Agarwal 1994, Unnithan and Srivastava 1997. Carter is critical of the use the notion of agency as divorced from culture.

17 Lingam (1995) argues that the focus on reproductive rights to the exclusion of women's social, economic and political rights, is a limited one. Powered by western consumerism and north-south inequalities such a perspective is in danger of reinforcing the view of women mainly as biological agents.

18 Unlike Sheikh women in Jeffrey and Jeffrey's study, Nagori Sheikh women were neither hostile to sterilisation nor generally open to any other methods of fertility control.

Will the Right Monetary Aggregate for India Please Stand Up?

Raghbendra Jha
Ibotombi S Longjam

This paper re-examines the monetary aggregation procedure in India in the context of the new monetary aggregates proposed by the Third Working Group of the Reserve Bank of India.

I Introduction

IN the wake up of the new monetary aggregates proposed by the new (Third) Working Group of the Reserve Bank of India in 1997-98 [Reserve Bank of India 1998], the practice of adopting the simple sum procedure of monetary aggregation needs to be reviewed.[1] Some criticisms of this approach are well known in the debate on the substitutability/complementary relationship of monetary assets and have attracted a great deal of attention in the literature. The first criticism is that theory would require that the constituents sought to be aggregated should first be shown to be mutually (weakly) separable. If this condition is not satisfied, we cannot have a consistent and meaningful aggregation of money stock.

Second, even if the monetary asset group happens to be weakly separable, there may be no basis for adopting the simple sum procedure. In the literature, there is widespread criticism of adopting simple sum methods in monetary aggregation. The most important reason for this is that the simple sum procedure treats all the included monetary assets as alike in their 'moneyness' and implicitly assumes that all the component assets are perfect substitutes. But in reality, it is highly unlikely that all the included assets would have identical monetary attributes. As Barnett (1980) argues, "if one wished to obtain an aggregate of transportation vehicles, one would never aggregate by simple summation over the physical units, of say, subway trains and roller-skates. Instead, one could construct a quantity index using weights based upon the values of the different modes of transportation."

In much of the current work the Divisia index has been found to be a desirable monetary aggregate in the sense of approximating flexible functions in aggregation theory. An important factor guiding the choice of the components to be included in the Divisia index is the desire by its proponents to prove the superiority of the Divisia index to the simple sum. Notwithstanding this, the literature in the Indian context [see, for example, Subrahmanyam and Swamy 1991, Ramchandran and Kamaiah 1994] have constructed Divisia aggregates using the same components as those to form the 'preferred' simple sum-aggregates, rather than on the basis of components that are weakly separable. The competition is thus biased at the outset in favour of simple sum aggregates.

Divisia indices are constructed on the basis of consumer demand theory by finding out the exact aggregation of weakly separable assets. Barnett (1982) points out that an aggregate of monetary assets should be determined only if they, in addition to separability, also satisfy consistency and existence conditions. Violations of these conditions will lead to the constituents of the monetary aggregates having spurious and unstable relationships which will, in turn, lead to the aggregate being less than useful.

Motivated by these criticisms, we re-examine the monetary aggregation procedure in India. The paper is organised as follows. In Section II we briefly review the literature on monetary aggregation theory with the simple sum as its special case and look for alternative monetary aggregates. In Section III we go into the underlying theory of relations of monetary aggregation and separability by taking a translog utility function of the monetary assets. We estimate a demand system and conduct tests for the weakly separability for plausible asset groupings to identify admissible groups in Section V, based on the available data which are mentioned in Section IV. We conclude the paper in Section VI.

II Monetary Aggregates and the Simple Sum

The issue of money and other monetary assets substitutability/complementary relationship has attracted a great deal of attention in the literature. Based on the theory of consumer demand, several papers have attempted to estimate the degree of substitutability among monetary assets, with Chetty (1969) advancing the notion of 'moneyness' in the choice of components of a suitable monetary aggregate. Most economists have placed little faith in broad monetary aggregates, since summation aggregation has long seemed inappropriate at high levels of aggregations over imperfect substitutes. As Friedman and Schwartz (1970) conjecture, the general approach that regards each monetary asset with varying degree of 'moneyness' deserves more attention than its special case – the simple sum approach in the construction of a sensible monetary aggregate. A number of interesting papers including Barnett (1980, 1982, 1984, 1990), Ewis and Fisher (1984, 1985), Serletis and Robb (1986) attempt to estimate the degree of substitutability among the monetary assets. Some have used constrained and others unconstrained flexible functional forms.

Simple sum is the practice that most central banks adopt as they find it practically easier to evaluate. This approach, however, contradicts the practice of other economic measurements like index numbers to measure the flow of monetary services provided by the stock of monetary assets. Belongia and Chrystel (1991) emphasise Barnett's point that a simple sum cannot internalise pure substitution effect and hence can change even if there has been no change in monetary service flows. In principle, anything that currently does or might potentially provide monetary services should be included. In other words, a broad set of financial assets should be considered. This not only makes it more like the 'envelope' approach taking full account of the portfolio adjustments associated with shifts in the yield curve, but also allows the impact of financial innovations to be absorbed [Ford, Peng and Mullineux 1992]. Another important issue in monetary aggregation is the question of choosing the monetary assets to be grouped and fixing a proper superlative index. Following Barnett's steps, the set of the monetary assets that satisfies both the consistency

and existency conditions should be determined. Then using the user costs prices for each component asset, a superlative quantitative index over the admissible group can be computed.[2]

One of the objectives of this paper is to discover the structure of degree of 'moneyness' of the monetary assets by testing the condition for weak separability. The standard procedure in the literature in this regard is to use flexible functional forms to approximate unknown aggregators. The advantage of this method is that the demand systems equations corresponding to this functional form can approximate (up to first and second order derivatives) the demand system equations that are derived from the unknown utility function of the representative consumer. In this paper, the tests for the appropriateness of the weak separability conditions have been conducted by using static models. We use the translog functional form as proposed by Christensen, Jorgenson and Lau (1975). This form is relatively attractive in the sense that it does not restrict the values of the elasticities of substitutions and does not impose undesirable a *priori* restrictions.

III
Monetary Aggregation and Separability

Suppose there is a set M of N monetary assets x_i, $i = 1,\dots, N$. An admissible grouping will be one such that it is consistent and separable (from others). The separability condition implies that some subset, say, M_1 is a weakly separable block, i e, the marginal rate of substitution between any two assets in the subgroup M_1 is independent of any other asset which is not in M_1. The consistency condition is that the elasticity of substitution between any two assets in M_1 is independent of any other asset not in M_1. Suppose the utility function f(x) of the inputs x_i for $i = 1,\dots, N$ takes the translog functional form.[3] Then,

$$\ln U = \ln\alpha_0 + \Sigma_{i=1}\alpha_i \ln\pi_i + 1/2\Sigma_{i=1}\Sigma_{j=1}\gamma_{ij} \ln \pi_i \ln \pi_j \quad \dots(1)$$

where $\pi_i = (R - r_i)/(1 + R)$ is the user cost of the i th asset, R being the rate of the bench mark rate and r_i's are the own rate of asset i th. The translog functional form is a widely used model for its strength in estimating the precise elasticities of substitution.[4]

Normally, one does not estimate the direct translog functional form given in the equation. We take an indirect utility function, say $H(v_1, v_2,\dots, v_n)$ where v_i's are expenditure normalised user costs of the financial assets x_i. We apply Roy's Identity to the equation such that the budget share of each asset i is given by,

$$S_j = (\alpha_j + \Sigma_i \gamma_{ij} \ln v_i)/\alpha + \Sigma_i \gamma_i \ln v_i) \quad \dots(2)$$

where $\alpha = \Sigma_j \alpha_j$, $\gamma_i = \Sigma_j \gamma_{ij}$

and S_j measures the cost share attributed to the restrictions the i th monetary asset, which is

$$S_j = \gamma_{ij}/\Sigma_{j=1} \pi_j x_j. \quad \dots(3)$$

We wish to estimate equation (2). Since the share equations are homogeneous of degree zero in the parameters we use the usual normalisation of the parameters:

$$\Sigma_j\alpha_j = -1.$$

The next logical question is: what assets should be selected and how should they be grouped? There are a large number of assets to be put into separate groups. Instead of a priori assignments to separate groups, one can put those assets that are (weakly) separable, as a group, from other assets into one group. This is achieved by testing for weak separability of assets in the consumer's preference structure. The practical importance of separability results from three facts: (a) separability provides the fundamental linkage between aggregation over goods and the maximisation principles in economic theory; (b) separability provides the theoretical basis for partitioning the economy's structure into sectors; and (c) separability provides a theoretical hypothesis, which can produce powerful parameter restrictions, permitting great simplification in estimation of large demand systems.[5]

Once the demand system is estimated, the separability test can be carried out by testing the validity of the weak separability restrictions imposed on the parameters, α_i and γ_{ij}. In our present case there are three financial assets x_i for $i = 1, 2, 3$. Suppose two of them say x_1 and x_2 are separable from the rest of the assets, then U takes the special form

$$\ln U = f[\ln G_1(\ln x_1, \ln x_2), \ln x_3]$$

The selection of an admissible group of financial assets is based on the theoretical restriction of the aggregator function of the various financial assets. Testing for separability takes the form discussed in Denny and Fuss (1977). According to this test, the hypothesis that the assets x1 and x2 are separable in the utility function with three assets x1, x2 and x3, implies the following restrictions:

$$\alpha_i \gamma_{j1} - \alpha_j \gamma_{i1} = 0 \text{ for } i \neq j,\ i, j = 1, 2, 3.$$
$$\alpha_i \gamma_{j2} - \alpha_j \gamma_{i2} = 0 \text{ for } i \neq j,\ i, j = 1, 2, 3.$$

These restrictions can be tested empirically. Denny and Fuss further argue that this is identical with the Berndt-Christensen (1974) non-linear restrictions. In our case the test will be with reference to alternative monetary assets.

Before we test for weak separability, it is essential to examine for the consistency of the parameters that are maximising the utility function. We need to test the validity of the functional and theoretical form of restrictions, which are known as the integrability conditions.[6] Because of our construction the adding up requirement is easily satisfied, as sum of the shares S_i is 1 and hence we need to estimate only n-1 equations. The existence of the symmetry of Slutsky's cross partial derivatives can be checked by testing for the restriction $\gamma_{ij} = \gamma_{ji}$ for $i \neq j$, $i, j = 1,\dots,n$. Since the shares themselves are non-negative, the positivity condition is also valid. The curvature conditions (necessary but not sufficient for the Hicksian matrix to be negative semi definite, and hence the second order conditions for utility maximisation to be satisfied) is that the own elasticities of substitution must all be non-positive. Next we need to consider the functional form restrictions which require that the linear homogeneity condition be satisfied, i e, $\Sigma_j\gamma_{ij} = \Sigma_i\gamma_{ji} = 0$. Given that $\Sigma_j\alpha_j = -1$ also implies $\gamma_{ij} = \gamma_{ji}$. Allen-Uzawa elasticities determine the monotonocity conditions which require that the own price elasticities of substitutions be strictly non-positive.

IV
Data

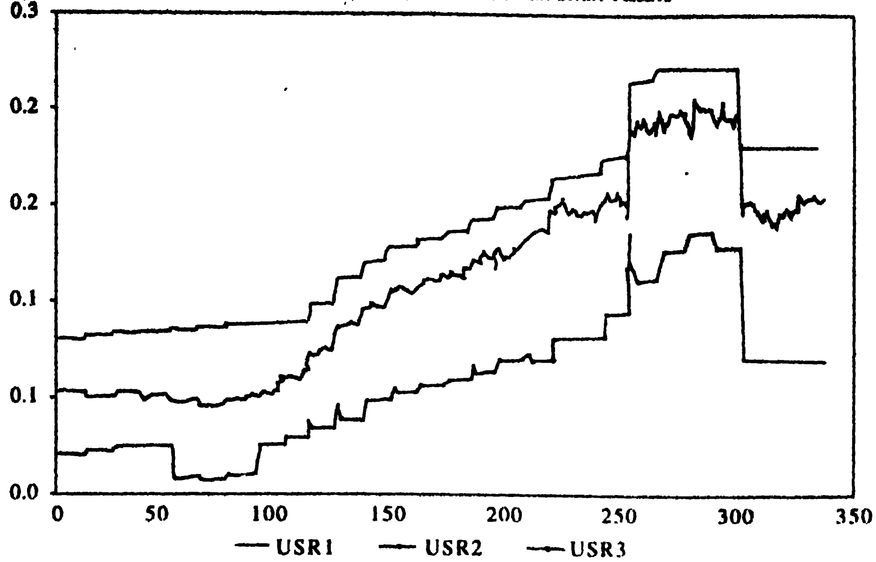
A monthly time series of the components of the stocks of money M_0, M_1 and M_3 are taken from the Report of the Third Working Group [Reserve Bank of India 1998]. This data set consists of the currency in circulation, currency with public, reserves of the banks, demand deposits and time deposits over the period March 1970 to February 1998 (number of observations is 336). We are reconsidering the monetary aggregation of these assets into (typically) the M_1, the M_3 as per definitions of RBI. In particular, we focus on the broad money aggregate, M_3.

TABLE 1: MONETARY AGGREGATES AND THEIR COMPONENTS

Instrument	Yield
Currency with the public (x_1)	Zero
Demand deposits (x_2)	Klein's rate
Time deposits (x_3)	One-year bank deposits

Source: *Reports on Currency and Finance*, RBI.

Figure 1: The User Costs of the Monetary Assets



As far as the selection of interest rates is concerned, one needs to be careful because interest rates play a crucial role since the user costs – the opportunity costs of forgoing the benchmark asset – are calculated from their own rates relative to a benchmark rate. In this regard, the Central Bank does not show what interest rates have been chosen and the criteria for this choice. Since a regular measurement of own interest rates of the particular monetary assets is not available, we take proxies. For currency the yield is assumed to be zero since currency does not give any returns and is meant for transactions only. We proxy the returns on demand deposits by using Klein's formula.[7] The yield on one-year bank deposits is taken as a proxy for the return on time deposits. The choice of proxy for the yield on the benchmark rate is crucial since this alone can vary the user costs. One also has to keep in mind that the user cost is non-negative. Generally, the highest of all the available returns is considered. We choose the yield on the debenture as the proxy for the benchmark rate.

V
Empirical Results

In the literature, it is found that Divisia indices are generally more effective than their simple sum counterparts indices in studies on money demand study or for direct policy purposes, particularly if the user costs of the different components fluctuate to any degree over the sample period of time. In the Figure 1 we graph the behaviour of the user costs of some of the monetary assets. In this figure USR1 refers to the user cost of currency, USR2 to the user cost of demand deposit and USR3 to the user cost of time deposit.

Differences among monetary aggregates can be traced to the particular specification used and to the choice of the components over which the aggregation takes place. Since user costs fluctuate, we should model money demand as a system. In this paper, we look for different alternative monetary assets by testing approximate weakly separable groups. First, the system of demand equations involving the user costs of monetary assets as the exogenous variables and the shares of the monetary assets in the total expenditure as the endogenous variables is estimated by using non-linear seemingly unrelated method. Then we check whether conditions of symmetry ($\gamma_{ij} = \gamma_{ji}$) and linear homogeneity ($\Sigma_j \gamma_{ij} = \Sigma_i \gamma_{ji} = 0$) are satisfied.[8] Then, in order to test for (mutual) weak separability we impose restrictions on the three monetary assets. We test for all the possible alternative groupings with different combinations of the assets. All the results of these hypotheses are reported in Table 2. Corresponding estimates for the restricted model are reported in Table 3.

Testing for weak separability involves

computation of the value $\lambda = 2(\ln Un - \ln Ur)$ where $\ln Ur$ is the log likelihood value with the separability restriction and $\ln Un$ is the corresponding value without these restrictions. Under the null hypothesis that the restrictions hold λ will be distributed as a χ^2 with r degrees of freedom where r is the number of restrictions imposed. The last column of Table 4 indicates that the computed value, in each case, is much higher than the critical value of χ^2 even at the 1 per cent level of significance. Hence, in each case the separability restrictions are decisively rejected.

FIGURE 2A: DIVISA GROWTH RATES

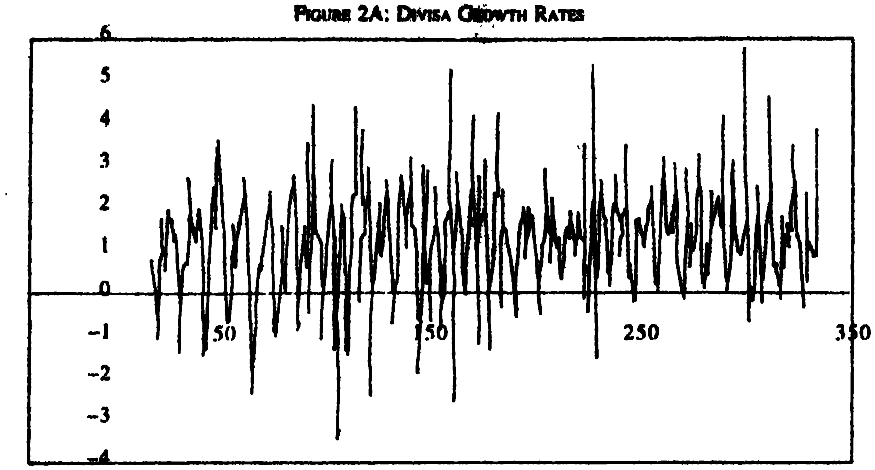

FIGURE 2B: SIMPLE SUM GROWTH RATES

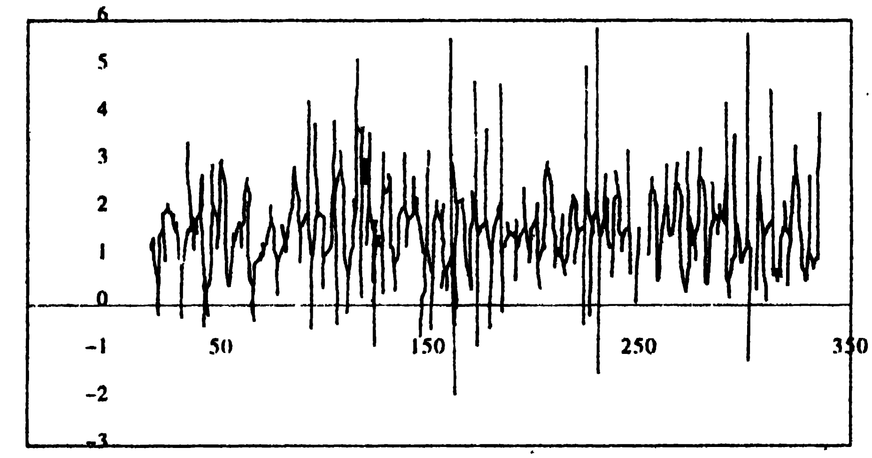

FIGURE 3: M_3 AND DIVISIA INDEX OVER THE SAMPLE PERIOD

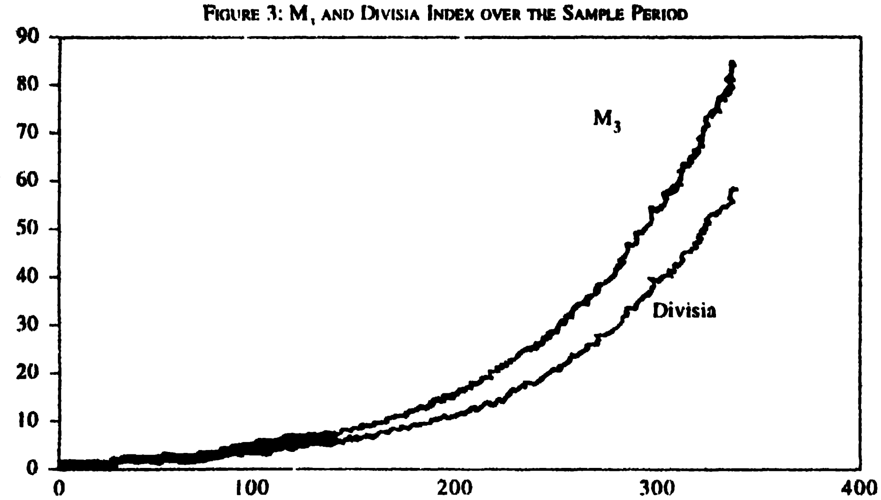

We also compute the own and cross price elasticities with respect to the user prices. Once we get these elasticities we can derive the elasticities of substitution by using the Slutsky equation. The expenditure (income) elasticities from the indirect translog function (equation (1)) can be written as:

$$\varepsilon_i = 1 + (\partial \ln S_i/\partial \ln E) = 1 + \{[-\sum_j \gamma_{ij}/S_i] + \sum_i \sum_j \gamma_{ij}\}/(-1 + \sum_i \sum_j \gamma_{ij} \ln \pi_j^*)$$

where $E = \Sigma \pi_i x_i$.

The own price elasticities are:

$$\eta_{ii} = -1 + \partial \ln S_i/\partial \ln \pi_i = -1 + \{[\gamma_{ii}/S_i] - \sum_j \gamma_{ji}\}/(-1 + \sum_i \sum_j \gamma_{ji} \ln \pi_j^*)$$

whereas the cross price elasticities are:

$$\eta_{ij} = \partial \ln S_i/\partial \ln \pi_j = \{[\gamma_{ij}/S_i] - \sum_j \gamma_{ji}\}/(-1 + \sum_i \sum_j \gamma_{ji} \ln \pi_j^*)$$

Finally, the elasticity of substitution between assets i and j is, simply,

$$\sigma_{ij} = [\eta_{ij}/S_j] + \varepsilon_i$$

For simplicity, and without any loss of generality we take $\pi_j^* = 1$ so that $\ln \pi_j^* = 0$.[9] Own and cross price elasticities are reported in Table 5 whereas estimates of elasticity of substitution between different monetary aggregates are reported in Table 6. It is important to note that all own price elasticities are negative. The elasticities of substitution estimates indicate that the components of the monetary aggregates are, broadly, complementary to each other in the representative consumer's utility function.

The Divisia Index can be written as: $Dt = D_{t-1} \prod_{i=1}^{n} \left[\frac{x_{it}}{x_{i,t-1}}\right]^{w_{it}}$ where D_t is the Divisia index at time t of the monetary assets x_i and $w_{it} = (1/2)(S_{it} + S_{it-1})$, S_{it} being the budget share of asset x_i.

In Table 7 we report the correlation coefficient between Divisia and simple sum (M_3 figures) for the levels as well as rates of growth over the sample period. We find that, although the correlation is high, it is not perfect. The correlation in the growth rates is smaller. This is important to remember in the context of the fact that it is the growth rate that has been targeted. This is borne out in Figures 2A and 2B. Further, the simple sum is always higher and the gap between it and the Divisia index grows over time. This is also

TABLE 7: THE CORRELATION BETWEEN THE SIMPLE SUM AND DIVISIA INDEX

	Simple (Level)	Divisia (Level)	Simple (Growth)	Divisia (Growth)
Simple sum (level)	1			
Divisia index (level)	0.999921	1		
Simple sum (growth)			1	
Divisia index (growth)			0.899349	1

borne out in Figure 3 which graphs (scaled) values of the Divisia index and M_3 over the sample period. Hence, the errors in using the simple sum have been getting compounded over time

VI
Conclusions

In this paper we have re-examined the monetary asset groupings of the monetary aggregate of the Reserve Bank of India We estimate a system of demand equations of three monetary assets, namely, currency with public, demand deposits and time deposits The separability tests we conduct for various admissible monetary assets lead us to reject any independent grouping of two assets out of the rest Since we take a monthly data analysis, the result is robust

It should be noted, however, that the choice of proxies for benchmark rate and yields on other assets plays a crucial role Because the asset groups are neither equivalent to each other nor constant, we face the interesting question of the relative performance of the monetary assets over this period The nature of the differences among the monetary aggregates appears to depend on the particular specification used and upon the choice of the components over which the aggregation occurs This paper has argued that since separability condition is not satisfied, the Divisia would be a better index to use than the simple sum [10]

Notes

1 It is to be noted that the Third Working Group itself has not questioned the simple sum procedure
2 The superlative quantity index is the index which bridges the gap between statistical index theory and monetary aggregation theory
3 To permit the construction of a demand system which involves only the opportunity costs and quantities of the monetary assets we assume the utility function is functionally separable between monetary assets on the one hand and goods on the other
4 But as Barnett (1982) cautions this translog function is only effective in approximating at local points Barnett and Lee (1985) Barnett Lee and Wolfe (1987) use a more generalised Taylor's series expansion for producing globally functional form like Minflex translog and generalised Leontief functions to approximate the aggregator function globally The Fourier flexible function has global properties and is considered to be an essentially unbiased form [Gallant 1981]
5 The importance of separability tests is highlighted in Barnett and Choi (1989)
6 The complete set of conditions that have to be satisfied by satisfactory theoretical demand system equations are additivity, symmetry, linear homogeneity, positivity and monotonocity
7 The returns on demand deposits. R_D is given by $R_D = R_T(1 - \theta)$ where θ is the ratio of bank reserves to the demand deposits and R_T is the yield on the 91-days treasury bill
8 In our case as in much of the literature the symmetry and homogeneity restrictions are not satisfied
9 The translog functional form is an approximation of a Taylor series expansion at an arbitrary point π^* See Ewis and Fisher (1986)
10 For reasons of space we are not reporting the computed Divisia indices for the sample period here These are available from the for author

Public-Private Partnerships for Urban Poor in Ahmedabad

A Slum Project

Uttara Chauhan
Niraj Lal

This article examines public-private partnerships for the development of the urban poor, based on our experience of the Slum Networking Project in Ahmedabad. We examine three issues. The first concerns the reasons that impede public-private partnerships. The second is the tardy progress that the central and state governments have made in providing housing and employment to the urban poor. Why should the corporate sector join hands with government organisations and NGOs for the development of the urban poor? This is the third issue we discuss in this article.

ON April 19, 1997, the infrastructure component of the pilot project of a unique, not-for-profit slum upgrading experiment, the first of its kind in the city of Ahmedabad, was completed in just under 10 months. After settling his accounts with the implementing agency (the Strategic Help Alliance for Relief to Distressed Areas (SHARDA) Trust, promoted by Arvind Mills) the project contractor said to one of the trustees, "Now tell me. Why did Arvind really do this project?"

This comment and similar comments from others inspired us to write this article. Here we intend to examine the issue of public-private partnerships for the urban poor, through the case of the Slum Networking project[1] at Sanjay Nagar, Ahmedabad. Public-private partnerships are essential for solving major societal problems. In India, such partnerships are not very common because in the absence of a comprehensive institutional framework government/quasi-government and private organisations do not see the rationale for working together. The rationale is that there are far greater chances of success through co-operative activity than by going it alone. Our experience in this project shows the difficulties involved in working with the government and quasi-government organisations. We highlight these difficulties and analyse the reasons leading to them. We also attempt a thumbnail sketch of the pre-conditions for a workable public-private partnership for carrying out projects for the urban poor.

I
Project Details

Inception of the Project: In December 1994, Himanshu Parikh, an environment and infrastructure professional met Sanjay Lalbhai, MD, Arvind Mills. Parikh showed the Arvind management team the remarkable urban improvements achieved through the slum networking strategy demonstrated in Indore through the British government-sponsored Indore Habitat Project. Lalbhai and his team saw the project as an excellent way to improve the quality of life in Ahmedabad. They pledged Arvind Mills' support for a similar initiative in Ahmedabad, on a smaller 'pilot' scale.

Initially, Arvind Mills and the slum community were to be the two main partners in the pilot project. Soon after securing Arvind's commitment, Parikh approached the Ahmedabad Municipal Corporation (AMC) with the objective of launching a citywide project. The AMC was then headed by Keshav Varma, one of the most dynamic municipal commissioners in the city's recent history. Varma not only initiated a citywide project covering all of the city's slums, he also pledged the AMC's support to the pilot project. The population to be covered under the Pilot Project was subsequently doubled. The standing committee of the AMC gave its formal approval to the project on September 28, 1995. The ruling party, the Bharatiya Janata Party (BJP), christened the project Pandit Deendayal Upadhyaya Antyodaya Slum Networking Project after one of its most revered ideologues.

Objectives and Components: The three objectives of the pilot project were: (a) to improve the basic physical and non-physical infrastructure facilities within the selected slum areas, (b) to facilitate the process of community development, and (c) to build up a city level organisation for slum networking and infrastructure development. A two-pronged strategy was employed to improve the quality of life of the slum-dwellers. The first step was to improve their physical environment (the 'hardware') through the physical development component. The second step was to upgrade their level of health, education and skills for income generation (the 'software') through the community development component.

(a) Physical development: Initially, seven basic infrastructure services were to be installed: (1) roads and pavings, (2) individual water supply, (3) house to house underground sewerage, (4) storm water drainage, (5) street lighting, (6) solid waste management, and (7) landscaping. The intention was that the slum communities would build individual toilets on their own through the AMC's Low-Cost Sanitation Scheme. Subsequently, the AMC announced that it would "throw in a free toilet for each household" as a part of the project.

(b) Community development: After improving the physical environment, the idea was to quickly focus attention on the other needs. A socio-economic survey of Sanjay Nagar's residents indicated that the levels of basic health, literacy and skills are very low. The community development programme aimed at addressing these deficiencies, through the following activities: (1) setting up neighbourhood groups, women's groups and youth activities, (2) mobilising community savings for undertaking physical works as well as for credit through savings and loans groups, (3) initiating educational activities for pre-primary age children, school drop-outs and illiterate adults, (4) organising community health education and other interventions related to mother and child care, and (5) supporting income generating activities by providing vocational training and job access to unemployed persons. Developing linkages for formal sector finance to help people start small businesses and trades.

SHARDA Trust did not have the requisite organisation for carrying out the community development programme. Therefore, the main responsibility for this was given to SAATH, an Ahmedabad-based NGO which has been working with slum communities since 1989. During the project, the trust and SAATH had an on-

going dialogue regarding the strategy for carrying out the community development programme.

Cost-Sharing Formula: With the inclusion of the AMC and SAATH, the pilot project underwent considerable modification. Each participant organisation would share a part of the cost of one or the other component. This ensured that the burden did not fall on any one organisation. Further, with each slum household making a financial contribution, the slum-dwellers ceased to be 'beneficiaries' of a 'welfare' programme. They became stakeholders in the project. The final cost-sharing formula is shown in Table 1.

The pilot project was to cover 3,300 households residing in slums and chawls in four pockets of the city as given in Table 2. Soon after the AMC's approval, however, the residents of Sankalchand Mukhi Ni Chali and Kachwadi Ni Chali/ Santokbai Ni Chali decided, for various reasons, that they did not want to participate. The resource mobilisation for the other two slums was initiated immediately. At the time of preparing tenders, the Pravinnagar-Guptanagar residents had not mobilised the requisite financial resources, the community at Sanjay Nagar had. It was decided to go ahead only with Sanjay Nagar, to begin with. The ground-breaking ceremony was held on August 5, 1996. Construction began soon after.

Sanjay Nagar: It is located on a 1.75 hectare plot of land owned by the AMC. The population of Sanjay Nagar is approximately 1,200, comprising 181 households. Most of the residents belong to the 'Vaghri-Patni' community. The major occupation is retail vending of vegetables and fruits. The community is characterised by low levels of education, low skills and poor health. The average number of persons per household is 6.26, higher than the all-India average. Over 51 per cent of the community is illiterate. More than two-thirds of the deaths in Sanjay Nagar are in the age group 0 to 4 years. Only 37 per cent of the community is engaged in some occupation or the other, of which only 15 per cent have salaried jobs, while 51 per cent are vendors. Before the project, there was virtually no physical infrastructure, save for three public standposts and two blocks of public toilets. Without security of tenure, the community had not invested in permanent shelters. Their houses were constructed of temporary materials like mud and plastic sheets. The average amount of living space per person in Sanjay Nagar is 4.72 sq mt.

Rationale for Arvind Mill's Participation: There are two reasons for Arvind's participation in the slum networking project. Enlightened self-interest is the first reason. Following the dictates of the organisational philosophy is the second.

Arvind's investment in Ahmedabad, as on March 31, 1997, was about 8.5 bn rupees. By December 1998, this investment will increase to approximately 15 bn rupees. Also, Arvind is getting the characteristics of a global company, and therefore must attract the most talented people in the world to work with it. To do so, the 'quality of life' in Ahmedabad, the company's headquarters must be of international standards. This would not be possible when 40 per cent of the city's population resides in slums. Although Arvind alone cannot solve this gigantic problem, it can work with the AMC to establish the feasibility of upgrading slums. This was the enlightened self-interest that made Arvind commit itself to co-financing and implementing the pilot project. Arvind Mills has also proactively participated in other city improvement projects in Ahmedabad, viz, the Rs 4 crore C G Road Redevelopment Project and the Rs 1.25 crore beautification projects for the Sardarbaug and Airport Gardens.

Serving people, particularly the lesser fortunate, has been a dominant value in the Indian society, which in turn has influenced Arvind's philosophy. Since their very inception, the Lalbhai Group of Companies (of which Arvind is the flagship company) have been involved in a host of activities beyond mainstream business in the city of Ahmedabad. The city's first mayor, Chinubhai Chimanbhai, was from the Lalbhai family.

'Ground Rules' of the Project: There were no legal agreements between the partners of the project. The 'ground rules' were alluded to in the resolution passed by the AMC during project approval. Fine-tuning of these rules and the partners' roles was done as the project progressed. The lack of explicit definition of organisational and individual roles caused many problems during implementation.

(A) Resolution passed by AMC: The AMC document[2] clearly stated that in the pilot project, the AMC was to take a 'backseat' role while the main responsibility was to be shouldered by Arvind Mills. It said "In the matter of seeking the Standing Committee's approval for the implementation of the slum networking project in a phased manner to provide civic amenities and improve the quality of life of people living in slums and chawls in Ahmedabad city, in collaboration with industrial houses and voluntary organisations, *and the Corporation playing the role of 'facilitator'*,..." (emphasis ours). It goes on to say that "...Although over the years the Municipal Corporation has provided various basic amenities to slum dwellers, *it has not helped much in improving their conditions.* With increasing population the problems are getting serious. This has necessitated looking into their problems and working out an action plan to solve them" (emphasis ours).

The same letter contains two points for approval, alluding to the role of Arvind Mills and other interested business houses: "(1) To encourage private sector participation in the project by permitting

TABLE 2 PARTICIPANT SLUM COMMUNITIES
(AS PER PILOT PROJECT PROPOSAL)

Sr No	Name of Slum	Zone	Number of Households (approx)
1	Sanjay Nagar Na Chhapra (near Anil Starch	North	200
2	Sankalchand Mukhi Ni Chali (Behrampura)	Central	500
3	Pravinnagar-Guptanagar (Vasna)	West	1500
4	Kachwadi Ni Chali and Santokbai Ni Chali (Chamanpura)	North	1100
	Total number of households		3300

TABLE 1 COST-SHARED IN PILOT PROJECT

Cost Component	Cost Per Family (Rs)	Participating Organisations' Share (Per Cent) AMC	Slum Communities	Arvind Mills	SAATH
Physical development	6000	33.33	33.33	33.33	0

Cost for 3300 families (Rs lakh)	250 14	101 67	69 30	69.27	9.90

Note: * This amount was sufficient to run the community development programme in Sanjay Nagar for about one year. SAATH decided to run the programme for a total of three years. The cost of carrying out the programme for an additional two years will be met out of SAATH's own funds.

interested industries to manage and implement the provision of services in groups of slums and chawls. (2) To implement the pilot project with The Arvind Mills Ltd, Himanshu Parikh, 'Saath' and the Ahmedabad Municipal Corporation, *under the supervision of the management of The Arvind Mills Ltd...*" (emphasis ours).

(B) Letters from the deputy municipal commissioner: SHARDA Trust desired that some operating procedures be clarified, so as to avoid difficulties in the future. Numerous letters issued by the deputy municipal commissioner in charge of the project, partly fulfilled this requirement. For example, since the trust would be making payments for the project on behalf of the AMC, a bill certification procedure had to be worked out. SHARDA Trust attempted, albeit unsuccessfully, to clarify these issues directly with the functionaries of the AMC's slum networking project (SNP) Cell. The deputy commissioner wrote to SHARDA Trust, and clarified the matter: "..As regards the certification of the bills it may be stated that *as the entire project is to be executed by the SHARDA Trust the bills may be certified by the Trust itself.* However, two engineers of the AMC (SNP Cell) will be with you who would verify the bills of the works carried out so as to make it easy for the AMC to satisfy the Audit Department in future. *All the bills may then be passed by the SHARDA Trust without any sanction of the AMC We may only be informed about the bills sanctioned for our record*"[3] (emphasis ours).

II
Assessment

Successes of the Project

The major successes the SHARDA Trust achieved in this project are three. First, it provided the basic infrastructure of good quality at low cost. Second, it stayed within the budget. Third, it caused all the changes in Sanjay Nagar through people's participation.

In a settlement devoid of any basic infrastructure, the project created infrastructure of good quality. Table 3 gives a clear picture about the infrastructure created in the area.

Table 3: Infrastructure Created in Sanjay Nagar

Type of Infrastructure	Units	Quantity
Pathways	Kms	1,000
Electric poles	Number	18
Sewerage	Kms	1,184
Manholes	Number	9
Inspection chambers	Number	46
Gully traps	Number	181
Water supply lines		
Main pipe line	Metres	700
Connecting line	Metres	750

(A) Quality: By 'quality' of the installed infrastructure, we mean its performance standards. SHARDA Trust believes that quality must be defined from the user's point of view. We elaborate these quality standards, from the users' point of view, for water supply, sewerage and storm water drainage.

The water supply: design had to ensure (1) an adequate quantity of water to each household; (2) 70 per cent of the water supplied in the morning, and (3) water pressure equal in each household during supply time. The sewerage: design had to ensure that there would be no blockages in the main line within the slum. Blockages within individual gully traps should not disturb the flow of sewerage in the main lines. The storm water drainage: design had to ensure that the storm water would run off the site and into the city-level mains within the least possible time. No ponding should occur on any surface of the settlement.

The actual performance of the installed infrastructure has been satisfactory. Sanjay Nagar receives about 120 lpcd of water supplied by the AMC's Asarwa housing tubewell station. Water is supplied from 6 am to 8 am. Effectively, water is received for about one hour and forty-five minutes. The pressure in the main line is about 1.25 psi. The main water tap in each house is at a height of two feet from the ground. It takes about 50 seconds to fill a bucket of 15 litres capacity. Thus, the requirements of quantity are fulfilled in about one hour. Till now, there have been no complaints regarding the quantity of water supplied. The water supplied by the AMC is chlorinated and tested for pH level, inorganic and particulate matter. For drinking purpose, the residents filter the water with a cloth or fine mesh. Till now, no blockage of sewerage main lines within Sanjay Nagar has been reported. The monsoon of 1997 in Ahmedabad was short but intense. While the areas in the immediate vicinity of Sanjay Nagar experienced water-logging, due to problems in the city-level mains, all areas within Sanjay Nagar remained dry. No ponding has been observed on any internal surfaces.

The infrastructure has been in operation since April 1997. The 'networking' strategy implies that the performance of on-site water supply and sewerage would largely be determined by the performance of the AMC's feeder infrastructure. Fortunately, for water supply, the performance of the feeder infrastructure is satisfactory. Otherwise, the trust would have 'topped up' the on-site infrastructure so as to meet the requisite standards.

(B) Cost: With no compromise in quality or performance, the choice of materials and engineering techniques employed in slum networking brings down the cost of infrastructure considerably, in comparison to conventional materials and techniques used by most government/quasi-government bodies. Table 4 shows a comparison of the actual costs incurred in the Sanjay Nagar project versus the estimated costs of a conventional approach.

The project stayed within the budget estimate for on-site infrastructure. In the tender, the cost estimates for on-site infrastructure was Rs 6,110 per household. After completion, the actual cost worked out to be Rs 6,171 per household. This was despite considerable unanticipated extra work.

The Sanjay Nagar community was a party to every major decision related to the project. From the design of infrastructure to the payment of contractors' bills, community representatives were consulted at each step. This was the method used in changing Sanjay Nagar's physical surroundings. Consequently, the residents of Sanjay Nagar voluntarily realigned and readjusted their houses to widen the roads. The residents of Sanjay Nagar have also formed and registered the 'Sanjay Nagar Residents' Association', a non-trading corporation. One of the first activities of the Residents' Association was to mobilise and manage a community corpus of Rs 100 per household, for maintenance of the on-site infrastructure. Most households have upgraded their shelters by themselves and out of their own funds.

Reasons for Successes

Cost efficiency at Sanjay Nagar was due to three reasons. First was the design, which sought to limit the cost without compromising on quality. This was achieved through innovative techniques and use of unconventional material. For example, the use of *in-situ* cement concrete for roads instead of the conventional flagstone paving results in a saving of over Rs 1,000 per household.[4] (See Table 4). Also, gully traps and small inspection chambers were used instead of large manholes. Similarly, the roads were given slopes, causing storm water to run off through gravity. This altogether eliminated the need for an underground storm water drainage system.

Efficiency in execution and supervision was the second reason. The trust steadfastly adhered to the design once all the partners had approved it. Perfect rapport between

the executing agency and the project contractor also helped to minimise costs. SHARDA Trust facilitated the contractor by providing him with working capital and helping him to acquireconstruction material. There were many occasions when the contractor could easily justify suspending the construction. But the Sanjay Nagar contractor continued to work, aiming at consistent quality and remaining within the estimates.

To avoid cost overruns resulting from delay, SHARDA Trust ensured that the work was not interrupted for lack of funds. To start the work on time, the Trust arranged for a loan of the required capital from the Arvind mills. Again, it persuaded SEWA Bank to grant loans to the residents to enable them to meet their financial obligations. To avoid delay, the Trust decided to temporarily underwrite the residents' contribution for individual power connection.

Failures of the Project

Despite these efforts, there are three major failures of the project. The first is delay in completing the pilot project. Very little achievement in community development is the second. The third failure is the organisations' inability to seek industry's participation in the citywide slum networking project. Particularly distressing is this failure, considering the remarkable success of the Sanjay Nagar project.

SHARDA Trust had planned to upgrade 3,300 slum households by December 1997. Till date, the Trust has upgraded only 181 households. Because of this, the Trust's administrative cost appears very high, even though it kept the overheads to the bare minimum. If the Trust had upgraded more slums, then the project overheads would not have appeared high, as shown in Table 5. However, because of problems with the alliance, it was not possible to cover the 3,300 households as planned in the pilot project.

Low level of achievement in community development was a major failure of the project. In SAATH's plan for community development, community health received the maximum attention followed by non-formal education related activities. In the area of skill formation and income generation, the NGO was not quite clear about what in practical terms it intended to do. Towards creating community organisations the NGO planned to move rather cautiously. Although the classes for preschool children started functioning as early as October 1996, nothing could be done to impart education to non-school going children, school dropouts and adults. Also, the number of preschool children attending the classes remained confined to 20 against the target of 30 fixed for the first year. Another significant shortfall in the target related to the number of teachers receiving training for activities in the component-two against four planned.

Achievement in the realm of skill development and income generation was even less impressive. Work started without clear thinking in this regard and little clarity seems to have developed even after over a year and a half. The picture about community organisation was no better. While the Sanjay Nagar Residents' Association was formed in January 1997 to facilitate the physical upgrading work, the women and youth fora are still nowhere in sight.

Arvind Mills gave strong support to this project. However, even Arvind's management is not keen to participate in this project on a wider scale. The cost Arvind incurs in upgrading slums is a charge on its profit before tax. The company is not able to complete the pilot project because of the AMC's bureaucratic hurdles. Therefore, the chances of other Ahmedabad industries' participation in this project are now slim. To date, only the Lions'

Table 6: Ahmedabad Municipal Corporation's Response Time

SHARDA Trust's Request for	Response Time in Days
Issuing of drawing showing final plot boundary of Sanjay Nagar	150
Verification of surveyor's second bill	71
Removal of public toilet	60
Removal of encroachments	60
Issuing policy letter on slum dwellers' contribution	70
Certifying accounts (engineering work) that SHARDA Trust submitted, the first submission being in November 1996	425

Table 4: Comparison of Cost of Infrastructure Installed under Slum Networking vs Conventional Method

Component	Conventional Method		Slum Networking		Difference	Savings
	Features	Cost per HH (Rs)	Features	Cost per HH (Rs)	in cost (Rs per HH)	(Per Cent)
Roads, pavings and pathways	Flagstone roads with curbing	2716	Concrete roads with curbing	1669	1047	38.55
Sewerage (within slum)	No topography management; extensive use of manholes	2760	Topo mngt shallow sewers, GTs/ICs instead of MHs	1597	1163	42.14
Water supply	Cast iron pipes	1687	Combination of CI/GI/AC pressure pipes	1945	-258	-15.29
Storm water drain	Underground storm drains	365	Roads act as drains	0	365	100
Total		7528		5211	2317	30.78

Note: The figures for costs under slum networking are from the actual costs incurred in the Sanjay Nagar project. The costs under Conventional Method are estimated, assuming that this method were to be used for the same project.

Source: Himanshu H Parikh, Consulting Engineers, Ahmedabad.

Table 5. Total Expenses of Slum Networking Project, July 1, 1995-June 30, 1997

Expense Category	Amount (Rs)	Per Cent of Total
Administrative cost	881,344.50	35.07
All other project related cost	1,631,717.41	64.93
Total	2,513,061.91	100.00
Administrative cost per household when project covered 181 households	4,869	
Administrative cost per household if project covered 3,300 households	267.07	

Notes: The administrative cost included assistant manager's salary, project consultant's fees, travelling expenses, books and miscellaneous expenses. The expenses incurred for administering the project do not include expenses for office space, expenses for computer and stationary. These Administrative costs would have increased only marginally if the Trust had covered 3,300 households. Other projects-related costs include: (1) cost of on-site infrastructure installed at Sanjay Nagar; (2) cost of carrying out physical surveys of Sanjay Nagar (181 households) and Pravinnagar-Guptanagar area (3,000 households); (3) cost of constructing 10 sample toilets at Sanjay Nagar; (4) newspaper advertisements for survey and construction tenders; (5) supervision fees; and (6) documentation charges.

Club has come forward to participate in the AMC's slum networking project.

Reasons for Failures

This experiment shows the pitfalls in managing any alliance, and particularly the alliance between quasi-government organisations, NGOs and the private corporations. It also sheds some light on the reasons for the city government's failures in providing relief to distressed areas. The latter experience strengthens the case for an alliance between the quasi-government organisations, NGOs and the private corporations.

Since delay in completion is the most striking failure of this project, we outline the major reasons for the delay. For successful completion, the Trust required active co-operation of other departments in the AMC. The purpose of setting up the SNP cell was to ensure smooth co-ordination with the other departments. However, at every step, the SHARDA Trust had to deal directly with each department, which behaved as a separate empire. None of these departments had any knowledge regarding the importance and details of this project. Most of the functionaries had a very negative, uncooperative attitude towards the project. For example, when we requested the town development office to mark the proposed town planning scheme roads on the Trust's survey map, the departmental functionary replied "Why should the AMC do this?" There were many such instances.

Delay and friction was also caused by lack of clearly defined role of the AMC functionaries. At the Sanjay Nagar construction site, the AMC engineer began to play a proactive supervisory role, despite the fact that SHARDA Trust had employed the contractor and was supervising him. There was tremendous confusion on site. Finally, the deputy commissioner advised his engineer to 'step back' in a letter addressed to him: "You have been placed in charge of Sanjay Nagar site which is the first slum taken up under the pilot project by SHARDA Trust constituted by the Arvind mills. The principal idea of placing you there was to see how the project is being handled by the professional agency... As the project is being handled by the Trust we are not required to directly deal with the contractors or the people at the site. We have to get involved in the process as mentioned earlier and interact with the management of the Trust for any improvement/corrections which are required to be made."[5]

Such problems with the AMC have caused enormous delays in carrying out the project. For granting approvals, giving information or carrying out a project task, the AMC takes an unusually long time. In spite of our vigorous follow-up, the AMC's average response time to such requests is around two months, as shown in Table 6. The delays caused by AMC result in financial losses to SHARDA Trust. Such losses are not reimbursed.

Although SHARDA Trust was prepared for bureaucratic delays, the experiences outlined above came as a big surprise to the Trust officials. The Trust was not only a co-financier of the project, but an important partner carrying out a prestigious project with the AMC. The AMC officials too were unhappy. In an interview during the project documentation,[6] the deputy city engineer in charge of the AMC's SNP cell averred that on several occasions they felt that they were not being treated as partners. Their well meaning interventions about the engineering aspects of the physical works were regarded as improper interference. They consequently felt sidelined and ignored. The administrative machinery of the AMC functions in a particular manner, he conceded, which may not conform to the corporate world standards; one might be compared with the metre gauge while the other with the broad gauge. But this did not justify the AMC being treated as if it had no *locus standi* in the project.

III
Public-Private Partnerships

Our experiences with the AMC represent the problems in forming partnerships with the government and quasi-government sector. There are two reasons for the difficulties in making such alliances work. The first reason is the same as the reason why any alliance is difficult to carry out. However, the second reason is more specific to the nature of the government and the quasi-government organisations. It has to do with the shared values in these organisations. We present the pre-conditions necessary for workable alliances between government, corporate and non-governmental organisations for urban poverty alleviation.

Definition of Alliance Roles

The very purpose of an alliance is to ensure a greater chance of success through co-operative activity than from going it alone. The key is to build on the unique strengths of each partner organisation, by assigning roles based on these unique organisational strengths. These roles must be explicitly defined in a common project document, a "Bible" for project implementation.

In our judgment, the unique strength of the government is its mandate from civil society and a large infrastructure already in place. In such projects, the government should play the role of a 'facilitator'. This means, besides co-financing the project, giving all necessary approvals, information and other support to the lead agency. The unique strength of NGOs is their ability to communicate effectively with the poor. Their role should be basically to work with the community to facilitate the physical upgrading work, as well as manage the community-based health and education components. The unique strength of the corporate sector is its managerial capability and its com-

petence in mapping out competitive business strategies. Therefore, the corporate sector should play the role of project manager and co-financier. It should also focus on the skill upgrading and income generation component of the project.

An alliance is meaningless unless each functionary understands his/her respective role in the alliance. Frequently the top brass conceives and negotiates alliances and delegates their day-to-day management to lower level supervisors, 'the troops in the trenches'. It is these troops in the trenches that are usually responsible for the failure of alliances. The onus of educating lower-level functionaries about their alliance roles rests on the shoulders of the top management of each partner organisation. Second, 'getting the job done' in an alliance involves close attention to a myriad of details. That the success of an alliance relies on attention to these details is a truth many managers literally learn on the job. In the slum networking project, we observed that process and politics received far more executive attention from the local government and the NGO than the 'real work'[7] of installing the infrastructure or other tangible steps towards improving the quality of life of the slum community.

Shared Values

The problems we have described are not 'teething problems' of working the alliance. These problems are endemic and inherent between government and quasi-government organisations. Lack of shared values in the organisation is the root cause of the problems. Gandhiji had perceived the councillors as the servants of the people[8] and said that citizens have the right to ask them to resign if they fail to discharge their responsibilities properly. The contemporary councillors[9] do not share these values. Consequently, the employees of the organisation also do not share these values. Among the employees of the Municipal Corporation, two sets of values are dominant: colonial values and the values regarding job security and enhancement in one's career. These values coupled with the Corporation's structure, and combined with the skills of the people cause the many problems discussed above.

The 'new rigour and order' introduced in the AMC by the municipal commissioner, Keshav Varma was, according to us, limited to only the 'creamy layer' of the AMC, and that, too, only in certain departments. The AMC's organisation structure, as experienced by SHARDA Trust over 30 months of the project duration, remained extremely functional and hierarchical. The hierarchical character of the corporation destroys all the employees' initiative. This, coupled with the value of concern only for one's career enhancement and job security, create systems in the organisation that are not conducive for ensuring quick response. The employees will use systems that will ensure that they cannot be blamed for any wrong decisions. In short the municipal corporation not working as a responsible partner in the alliance is inherent in the character of that organisation.

We are not pessimistic about the possibility of the councillors' values changing. However, this will only be possible when ordinary citizens stop being apathetic and demand accountability from their elected representatives. Only the citizens' 'pull factor' can change the values of today's government functionaries. The slum networking project at Sanjay Nagar is a small step towards mobilising this 'pull-factor' among low income communities in Ahmedabad.

Experience with NGO SAATH

Low level of achievement in community development was an issue on which there was considerable disagreement between SHARDA Trust and SAATH. The Trust was concerned that SAATH was not able to meet its own targets. SAATH's philosophy, akin to that of most NGOs, is that initiating and consolidating the process of change is more important than somehow meeting the targets. And, according to the NGO, its activities were already showing some impact on the pattern of living in Sanjay Nagar. Also, the two organisations disagreed on the skill upgrading component. SHARDA Trust believed that work on it should get underway soon. Skill upgrading was not a priority item for SAATH. During a visit to Sanjay Nagar by the MD of Arvind Mills and the deputy municipal commissioner, SAATH was asked to jointly prepare a plan for the community to avail of existing income generation schemes. SAATH felt that it was being 'pushed' and did not prepare any plan. The NGO was from the very beginning, wary of the alliance with the corporate partner, fearing the 'big brother' syndrome. In its 7th Annual Report, SAATH expressed its dissatisfaction, saying that "both the organisations have a different perspective and stand regarding development issues affecting the slum residents in the Slum Networking Project".

IV
Corporate Participation

Philanthropy to Enlightened Self-Interest

In spite of these experiences, we believe that the corporate sector should participate in urban poverty alleviation. It posseses certain strengths *vis-a-vis* the government and NGO sector. But if corporates are to participate meaningfully, the rationale for their participation must change from the philanthropy mode to that of an enlightened self-interest.

The role of industry, prima facie, is to create wealth through the production of goods and services. This production is to be carried out within a legal framework. The industry is expected to obey labour laws, pay taxes to the government and to respect the environment. Industries working within this framework are, according to us, fulfilling their 'social responsibility'. Anything beyond this is an additional burden. Investment in social development is a charge on profit before tax. In other words, social development is not the business or responsibility of the corporate sector. Nevertheless, certain corporates have, since their inception, made special efforts to go beyond their normal idea of business. Traditionally, the driving force behind such efforts has been philanthropy.

However, the philanthropy approach will not work effectively any more. Corporates can donate funds and be done with it. It is easy to give out doles. But this is not very meaningful. Most business houses do not formulate strategies for philanthropic activities. Sustained activities in this area is not a priority for the top management. Companies do not generally employ highly skilled persons for activities which run on a not-for-profit basis. A lax approach towards social development results in sporadic, ad hoc projects having little impact or long-term significance.

To make a mark in this field, corporates will necessarily require three basic attributes. First, a vision. A vision of a desirable society and the role of the company in that society. Second, the desire to be more than a donor or financier of development. Third and most importantly, the rationale for participation should be an enlightened self-interest. Unless the company has this kind of a stake in social development, it will not make a whole-hearted effort to bring about that development.

Corporate Strengths

Corporates can add considerable value to projects such as the Sanjay Nagar project through their direct participation. They

can bring in the requisite skills to manage the project and bring it to fruition within the stipulated time and budget. Their systems and structures are flexible enough to effectively respond to contingencies and unplanned events, without compromising the project objectives. Quality is an important corporate watchword. Most importantly, the relationship with the slum community has been like that of a business partner, rather than that of a donor and beneficiary, or a ruler and subject.

The Indian corporate sector possesses a unique strength *vis-a-vis* NGOs, especially the ones dependent on foreign funding. This is the ability to set its own agenda and work in a professional manner. It has the ability to take risks and test out new ideas. Self-funding and local accountability gives Indian corporates tremendous flexibility in day-to-day functioning, solid credibility and sound monitoring. Whether they admit it or not, NGOs are bound to work in sectors for which foreign funding is forthcoming. Very often, the Indian NGOs' development agenda is influenced by funding agencies on the other side of the globe. NGOs claim that they are 'accountable' to the poor in their constituencies, but the reality is quite different.

Corporates' Role in Skill Upgrading

In the long term, the urban poor can empower themselves only through economic empowerment. Economic empowerment can be achieved by upgrading their skills. As the Indian economy globalises itself, low-skilled people will be very badly hit. Therefore, development efforts should focus on helping the poor to upgrade their skills. Also, they will need to move into value added products and services if they are to significantly enhance their incomes. This is the role of the corporates. After all, who would be better equipped to help low-income communities in mapping out competitive strategies for their businesses? Day in and day out, companies identify viable businesses and train people to run them and compete worldwide. The corporates that go beyond being mere donors or financiers of development and involve themselves in economic empowerment will make a mark in the field of development.

V
Conclusion

The government of India and the state governments are concerned about providing housing to the weaker sections and creating employment. The Maharashtra state under the Shiv Sena-BJP government[10] launched its ambitious Slum Redevelopment Scheme (SRD) more than two years ago. Only one building containing 128 tenements has been constructed so far. The tardy progress made by the government raises doubts about its promise of building ten lakh free houses for slum-dwellers in Mumbai over the next five years. Similarly, the Jawahar Rojgar Yojana and employment generating schemes like the Employment Guarantee Schemes have failed to make an impact on the unemployment scenario.

The experiment in Sanjay Nagar throws light on the reasons why such good intentions of the government do not yield results. It also shows that we need a newer approach to solve the unemployment problem. We must upgrade the skills of the unskilled so that the unskilled can create for themselves well paying employment opportunities. To achieve this we strongly believe that the government, the NGOs and the corporate sector must work in partnership, with the government playing the facilitator's role.

Note

[The views expressed in this article are the authors' personal views. We would like to record our sincere thanks to V L Mote for the many suggestions and comments he made on this article. We would also like to thank Dwijendra Tripathi for permitting us to draw upon observations made in his forthcoming book *Alliance for Change: Slum Upgrading Experiment* in Ahmedabad.]

1 Slum networking is an integrated urban development strategy which attempts to tackle the infrastructure and environmental problems of slums in such a manner that the city as a whole benefits. By upgrading city slums, not as isolated islands, but as an urban net, it attempts to strengthen the city level infrastructure through networks. Actually, the networking strategy could not be demonstrated in the pilot project because geographically contiguous slums were not ready to participate in the project. Therefore, the Sanjay Nagar project is not an example of slum networking in the true sense of the term.

2 Letter of municipal commissioner to Municipal secretary, dated September 18, 1995, reference no1, slum upgradation department, Ahmedabad municipal corporation (translated from the original in Gujarati).

3 From the letter written by P U Asnani, deputy municipal commissioner (health and corporate planning), AMC, to V L Mote, trustee, SHARDA Trust, on March 4, 1996.

4 Flagstone paving has other disadvantages, including vulnerability to pilferage, inability to take heavy loads and higher long-term maintenance cost. Despite these facts, the AMC continues to use stone paving in its own sites under the slum networking project.

For a Politically Sensitive Gender Discourse

Rajeshwari Deshpande

THERE is no doubt that the demand for and granting of reservations to women in political offices have proved to be mere tokenism. All the same, the discussion around the issue, both within and outside the women's movement, has turned out to be very significant. These debates touched upon the crucial question of the interrelationship between the institutions of caste and patriarchy. The autonomous women's organisations as well as the women's fronts of the left parties had vehemently opposed quotas within quotas. However, there are a number of scholars who have recognised the need to seriously deal with the caste question if gender politics is to be advanced in Indian context.

There are two such formulations recently published in the *EPW* [Rege 1998 and Sonalkar 1999]. Both argue for setting up a new agenda for the women's movement as far as the essential and complex pattern of interrelationship between caste and patriarchy is concerned. Wandana Sonalkar emphasises that the category of women does not have sufficient unity to represent itself as a political group. On the other hand caste groups have more claims to being marginalised social groups with a social cohesiveness and common modes of being oppressed. This entitles them to seek political recognition as a group. Sonalkar argues that the struggles on behalf of women in India do not engage themselves with the forces of patriarchy on a social scale because they do not deal with the caste question. Familiar feminist initiatives get neutralised in the fractured social context in India.

Taking the argument further Rege articulates a dalit feminist standpoint. This standpoint has to be acknowledged and approved by the Indian women's movement in order to simultaneously deal with the forces of capitalism, patriarchy and brahminism. In other words, the women's movement needs to develop a political strategy to simultaneously address the issues of caste, class and gender to be relevant within the contemporary political set up.

Both Rege and Sonalkar are keen to point out that such a political agenda does not celebrate a variety of identity politics on behalf of women belonging to various castes. Rather, as Rege has rightly pointed out, a shift of focus from 'naming differences' to social relations that convert difference into oppression is imperative for feminist politics. Since caste operates at the institutional structural level, it perpetuates social inequalities to such an extent that the lower castes never have access to politics. The women's movement has to challenge these inequalities operating at the systemic level while dealing with the caste question.

These must be seen as very significant contributions to the theorisation about the women's movement as well as about Indian politics. It is for the first time that the Indian women's movement has engaged itself in a serious debate about the caste question. The issues raised by these discussions are relevant not only for gender politics but also for all those social movements which either negate caste as belonging to the superstructure or those who celebrate the category of people rather than differentiating them on the basis of caste and class.

Left politics in India has always neglected the significance of caste because of its orthodox understanding of the nature of Indian society. It has been discussed amply within and outside left circles. But the new social movements emerging as people's movements also tend to overlook caste realities. These struggles have engaged themselves in a political exercise of authenticating local communities. This exercise tends to overlook the caste inequalities operating at both the local and the larger societal level. The women's movement has shared the same perspective till today in its political practice. It has engaged itself in the political exercise of authenticating women without taking into consideration the essential caste class divisions among them.

That is the main reason why gender politics in India has remained a variety of identity politics. In fact its agenda has always strengthened this image. The movement has largely been engaged in attempts to politically legitimise a group that did not actually exist. That is why it articulated only those demands and raised only those issues which fitted in the pattern of identity politics at one or the other level. These were mainly related to misuse or insult of the female body and sexual relationships among human beings, thus generalising from the common experience of all women. However, the movement failed to situate these experiences within the broad context of political economy. At a more subtle level it failed to see and challenge the structural locations in terms of caste and class giving rise to these issues. While celebrating the personal as political, generally the personal experiences of urban middle class women were highlighted. Personal became political in order to publicly deal with patriarchy. Expressions of patriarchy were related to private experiences of patriarchy. As a result the women's movement exposed issues related to rape, dowry, sexual harassment and abuse of the female body, neglect of women's health etc. Gender politics was conceptualised in terms of granting justice to all the Indian women's *vis-a-vis* gender inequalities experienced by them.

The same considerations prompted the demand for reservations for women in politics. It was indeed a very naive political position adopted by the movement. In denying quotas to the lower caste women, these organisations completely failed to understand the complexities of the mainstream political context. As stated earlier, reservations ultimately proved to be mere tokenism. The political package extended by the state could have been utilised by the women's groups to expose the caste-based exploitation of women and perhaps also the shrewd strategies adopted by the 'casteist' male politicians in demanding quotas within quotas. However, this could have been possible not by opposing caste based quotas but by joining hands with the forces demanding them.

CORRIGENDUM

Indian Institute of Management, Ahmedabad
Revised dates for Summer School

With reference to the advertisement appearing on the inside front cover in the issue of February 27-March 5, 1999 the revised dates for Summer School are

Programme dates June 11-29, 1999 (instead of June 4-13, 1999)
Last date for receipt of applications April 25, 1999 (instead of April 15, 1999)

The demand provided a good opportunity to the movement to intervene in mainstream politics. But the movement failed to appropriate it. It is very interesting to note that the feminist scholars in India always criticise state legislation in the social sphere as neglecting the existence of pluralities and accuse the state of homogenising women. In opposing caste-based quotas the movement celebrated the same homogenised category of Indian women. Secondly, the demand for reservations also had a serious implication regarding the principle of representation as it changed the basis of representation from individual to group. If reservations are to be granted to women why not to OBC women or even men or to the disabled or homosexuals? All these groups can have their own claims of political representation. These claims cannot be entertained within the present political framework because it would lead to serious debates about representation and the concept of citizenship. The women's movement however neglected these subtlties and hastily sought reservations for women. It was a result of the crude development of the category of women by the movement.

It is indeed very difficult to organise struggles against patriarchy because it operates at the private-personal level and that too in a very subtle way. The problem becomes more complicated in a caste society. Therefore any struggle against patriarchy on a social scale has to initially combat caste inequalities. If gender issues are to be seriously brought to the forefront of mainstream politics, the movement has to discuss gender inequalities as operating through caste inequalities.

Till date the movement did not see gender issues through a caste-class perspective. Therefore the movement by and large remained apolitical in character. A false political consensus seems to be emerging around women's issues. It is expressed at various levels. The worst expression is the way in which the state seems to be co-opting the feminist agenda – granting reservations, chalking out health programmes for women, the judiciary protecting women from sexual harassment at workplaces, etc. In addition to these there is a general tendency within the agencies of mainstream politics (and also among social movements) to separate women and to discuss gender issues as related to the female body. This leads to NGOs identifying women as ideal target groups and departments of women's studies encouraged by the government. Like the issue of corruption, gender issues evoke a consensus around them and initiate middle class activism. That is why 77 per cent of voters approved women's reservation policy in a recently held voters' survey (*India Today*, May 31, 1996). Rightist forces can easily take over the feminist agenda because the movement is apolitical in character. In fact, the movement itself fell prey to the apolitical consensus around gender issues when a women's political party was formed in the wake of granting reservations to women. The apolitical character of the women's movement in India can be attributed to its neglect of the caste question leading to homogenisation of women.

The emerging consensus around gender issues must be seen as dangerous. In a competitive, unequal society no politics can be based on consensus. Politics must be understood in terms of confrontations and contestations. These confrontations take place at two levels, with the state and also with the dominant sections. However, politics in a competitive, unequal society also remains essentially strategic. It demands continuous alignment and realignment of social forces, appropriating and targeting the potential of the state and, most importantly, combating the focal points of exploitation. In other words the movement has to prioritise the political issues that it wishes to deal with in order to practise its political agenda successfully.

This means that the women's movement has to develop a more sophisticated understanding of the political context in which it operates. If caste groups prove to be more authentic in terms of their claims to political representation, the women's movement must respect these claims and join hands with them. If caste and class prove to be more obvious points of exploitation, the movement must give priority to issues of those women who belong to the oppressed castes and classes.

This would also mean joining hands with those political forces which are fighting for the oppressed caste-class groups even if they do not seem to be celebrating the conventional feminist agenda. In other words, gender issues can be effectively discussed and resolved within mainstream politics only by those political groups which simultaneously address the caste, class and gender issues and which are continuously engaged in confrontationist exercises. The feminist political agenda can be furthered only by a political party sensitive to the complex caste, class, gender relations and is willing to combat them politically. No doubt the autonomous women's movement has played a very significant role in Indian politics by exposing gender inequalities. It is still a major responsibility of the movement to continuously apply pressures from within as far as gender inequalities are concerned.

However, in itself the autonomous women's movement is unable to combat gender issues politically because it claims to represent a social group that is non-existent. The concept of sisterhood cannot serve as a basis for women's politics because it is fractured by caste inequalities. The women's movement needs to recognise that sisterhood is a utopia which has to be politically constructed by dealing with the forces of caste-class and patriarchy at the social level and not by isolating the gender issues.

My people - My strength

LIC's Group Superannuation and Group Gratuity Schemes - The driving force

Group Superannuation Scheme

- Contributions (inclusive of PF), are tax deductible up to 27% of salary.
- If implemented retrospectively, up to 80% of contributions (with respect to past service), are allowed for tax deduction spread over 5 years.
- Interest accrued at the rate of 11.75% to 12.8% p.a. (during the financial year 1998-99), depending on the size of the fund.
- The Superannuation Scheme can also be linked to life insurance cover.
- On retirement, a choice of pension payment plans is available.

Group Gratuity Scheme

- Simple administration, no more worries of planning for gratuity payments
- Attractive returns and tax benefits
- Scientific funding of gratuity liability based on actuarial valuation.
- Instalment funding for past liability, eligible for 100% income tax deduction in the year of payment.
- Employees insured for death benefit based on full anticipated service.
- Dual benefit of liquidity with high yield.
- Interest accrued at the rate of 11.75% to 12.8% p.a. (during the financial year 1998-99), depending on the size of the fund.

For details, mail us this coupon or contact us at the nearest LIC Divisional Office / Zonal Office

I would like to know more about the LIC Group Superannuation and / or Group Gratuity Scheme.
Please send me the details.

Vol XXXIV No 12 March 20, 1999

Black Economy and Macro Policy-Making in India

The major macro economic problems of the seventies and the eighties were integrally linked to the growing phenomenon of black income generation. The black economy should, therefore, have been a significant factor in analyses of the economy. Its non-inclusion in analysis resulted in a partial understanding of the Indian economy and often incorrect policy prescriptions. A discussion of the institutional practices of the black economy and an attempt to incorporate it into short-run macro analysis of the Indian economy. 681

Indian Bourgeoisie and Political Hindutva

The formation of a Hindu nationalist government in May 1998 at the crest of hindutva's recent electoral surge testifies to the increasingly authoritarian urges of India's ruling class. Hindutva's chances of holding state power more securely lie in a more complete hegemonisation of this now overwhelmingly capitalist class. Hindutva pursues this political aim in part by adapting its hitherto shrill and narrowly petty bourgeois ideology to the more settled nature, proclivities and imperatives of the ruling class. To this end it commands the resources of contemporary culturalism and neo-Gandhian discourse. 695

Telecom Tariff Reform

The suggestions made by the Telecom Regulatory Authority to reduce the price of international and long distance calls and raise telephone rentals and local call charges are eminently justified on efficiency grounds. Nor are the equity implications of the changes necessarily adverse. 672

Enron Revisited

With the commissioning of the first phase of the Enron power project in Maharashtra shortly, several issues critical to the management of the power system in the state will now have to be grappled with to ensure that the state electricity board's financial viability is not further undermined. 661

Infant Mortality Paradox

Kerala has recorded declining infant mortality, a high still childbirth rate and a high proportion of infant deaths in under one week. This paradox needs careful investigation. 713

Infrastructure Investment

Empirical analysis of the efficacy of public infrastructure investment in 15 states highlights that investment in social infrastructure has the closest linkage with economic growth across lagging, intermediate and leading states. 717

Derailing Railways

A reading of the railway budget 1999-2000 shows that the ministry has failed to evolve a coherent and effective strategy for capacity enhancement and technological upgradation. 666

Expendable Tribals

The several wildlife sanctuaries proposed by the Orissa government will displace thousands of tribals who have lived in these areas for generations. 667

Gunboats Again

The failure of America's Iraq policy vividly illustrates the limitations of latter-day gunboat diplomacy 671

Monetary Policy

The Reserve Bank's attempt to bring down interest rates is unlikely to revive industry in the absence of a sizeable increase in public expenditure and expansion of bank credit. 654

Education Guarantee

The Education Guarantee Scheme is grounded in the conviction that local accountability is critical. Community involvement in school management and the sense of local ownership of the school are what will make the difference, academic inputs and a teacher with basic educational qualifications being available. 726

Akalis' Secular Turn

The Akali tradition has been that whenever it is out of power all factions join hands and speak a belligerent language and when it is in office there is a power struggle in the party. The present feud between Parkash Singh Badal and Gurcharan Singh Tohra can be seen both as a continuation of this Akali tradition and something different in the present context of Punjab and Indian politics. 664

Perestroika?

EW/EPW does indeed deserve congratulations on its fiftieth anniversary, but for a reason different from those most of your letter-writers advance. I must admit I was not one of the magazine's fans in the late sixties and seventies, when I was an economics student. Whether its editorial viewpoints reflected the influence of Mahalanobis or Mao, they consistently displayed a blind prejudice towards market forces. When I migrated to the United States in the early eighties, I am afraid I lost touch with it.

Hence I was pleasantly surprised, on a visit to India, to pick up an issue of *EPW* at a friend's house. The lead editorial (February 13, 1999) pointed out the irrelevance of the Planning Commission's 'planning', and stated bluntly that 'major changes are imperative in labour laws and regulations to impart a measure of flexibility to the labour market and make possible the organisational restructuring so very necessary..."

My curiosity piqued, I checked the editorials in my friend's back issues over the past couple of years. I found a plea to embrace globalisation ("Rather than rail against these reforms, the task that lies ahead is to learn to adapt in international settings...Success will lie in the ability to engage – not in denial", August 16-23, 1997); a forthright call for the deregulation of oil prices and even the elimination of subsidy on kerosene (September 6, 1997); no less than three consecutive editorials calling for the government to immediately disinvest its sharholding in Maruti in favour of Suzuki (September 20 and 27 and October 4, 1997); strong support to the trade-liberalising exim policy (April 18, 1998); a call to reduce power subsidies to farmers (May 23, 1998); condemnation of protectionist measures, and a warning against excessive government borrowing (June 6, 1998); a defence of the liberalisation of gold imports (June 20, 1998); an admission of the government's inability to bear the growing burden of food subsidy (July 11, 1998); support for public sector disinvestment (September 5-12, 1998); a criticism of farmers' organisations' attack on Monsanto (December 5-11, 1998); a vigorous defence of the opening up of the insurance sector (December 12-18, 1998); and so on.

These are only a few instances; what should be noted is that even the remaining editorials hardly ever strike the old anti-market, anti-wealth-creation, themes. A consistent theme is the need to replace the 'outdated discourse' of public sector investment (May 30, 1998) with proper regulation of the private sector. No doubt there are a few notes pleading for the retention of directed lending, but that's about it. (However, one should note that there are very few editorials on economic topics in recent issues: the large majority are on political developments and strangely, on health and sports.)

Refreshingly, the *EPW* of today also does not suffer from a knee-jerk tendency to label the BJP. Its lead editorial of January 9, 1999 is quite fair to the BJP, and, unlike most of the press articles I saw in India, admits that Christian missionaries' activities in India are controversial. It even says legislation to regulate conversion "deserves consideration". Another editorial (February 6, 1999) courageously endorses the government's decision to move towards signing CTBT as "politically among the most unassailable decisions in international relations made by this country".

Whatever led to this *perestroika* in the *EPW*, it deserves support and encouragement from all open-minded persons. Here's to the next 50 years!

Fertility Decline in AP

THE paper on 'Fertility Decline in Andhra Pradesh' by K S James (February 20) sheds light on a major positive development that is taking place in the country. It gives hope that the population time bomb will ultimately be brought under control even though only after it has done a great deal of damage. However, one wonders why the author is reluctant to accept the role of mass media in fertility reduction in Andhra Pradesh even though he cites statistical evidence in its favour. In fact the mass media must be playing the same role in Andhra Pradesh as was played by literacy in Kerala. What should be recognised in this connection is that both literacy and mass media lead to better public awareness. It is possible that rural folk may score high on public awareness even though they do not know to read and write if they have sufficient media exposure through TV. On the other hand subsidised supply of foodgrains, while it provides economic benefit to the poor, is a factor which will encourage the poor to have more children since it considerably reduces the cost of bringing up children. Hence, it may not be correct to say that reduction in fertility can be brought about by the operation of PDS as is done in the paper.

P V RAJEEV

New Delhi

Stinking Criminal Justice System

THE recent statement made by Justice M N Venkatachaliah, chairman of the National Human Rights Commission (NHRC), that 60 per cent of all arrests made in India are "unnecessary and unjustifiable" underscores the need for the revamping of the police force and drastic reforms in the criminal justice system – suggestions made by the National Police Commission (NPC) way back in 1980.

According to Justice Venkatachaliah, in Delhi's Tihar jail, the largest in the country, only 10 to 15 per cent of the inmates were convicts, the rest have been languishing there as undertrials for years together. Most of these undertrials were arrested on petty charges. What is found in Tihar jail fairly represents the state of affairs in other parts of the country. The NPC, after a sample study, found out that a major portion of the arrests were connected with very minor prosecutions, and could not therefore be regarded as quite necessary from the point of view of crime prevention. Continued detention in jail of such persons meant avoidable expenditure on their maintenance. The NPC estimated that 43.2 per cent of the expenditure of the jails was over such prisoners who in the ultimate analysis need not have been arrested at all. Curiously enough, even after two decades things have not changed, as evident from Justice Venkatachaliah's observation that "unnecessary and unjustifiable arrests" accounted for 43 per cent of the total expenditure incurred by prisons.

One of the main reasons for such arrests is the arbitrary power enjoyed by the police force. The power to arrest any citizen without warrant even on flimsy grounds is granted to the police by Section 41 of the Cr PC. Apart from the Indian Penal Code, arrests are also made under local and special laws, like the Excise Act, Prohibition Act, Arms Act, Gambling Act, Suppression of Immoral Traffic Act, Motor Vehicles Act, etc. Under these acts, cases are registered, not on complaints from aggrieved parties (as under the Indian Penal Code), but on information and intelligence available to the police in their field work. This gives scope to the police to settle old scores by making arbitrary arrests of persons who may have provoked their ire, or from whom they can extort money. As the NPC pointed out, "It is generally known that false criminal cases are sometimes engineered merely for the sake of making arrests to humiliate and embarrass some specified enemies of the complainant, in league with the police for corrupt reasons". In fact, the NPC identified this particular arbitrary power of the police (to arrest without warrant) as the most important cause for corruption and malpractices, accompanied by extortion and harassment to the public. It is no wonder therefore that such false charges quite often lead to acquittals after years of unnecessary detention as undertrials in jails.

Justice Venkatachaliah has also referred to the high rate of acquittals (almost 80 per cent in cases involving heinous offences) and low rate of convictions. This is due to the failure of the police to make their arrests justifiable, as well as the ineptitude and corruption in the lower courts. The NHRC chairman has rightly pointed out: "...indiscipline is common in most of the lower courts nowadays, efficiency of witnesses' cross-examination has more or less disappeared and trials have become a farce". It is quite obvious that the concept of the independence of the judiciary from the executive is totally unknown in the lower courts, and is steadily getting eroded in the higher levels of the system. In the districts, one often finds judicial magistrates coming in police jeeps to attend courts. They can be even seen taking their cue from the police in delivering judgments.

As a remedy, the NHRC chairman has suggested reforms on the lines of the Police and Criminal Evidence Act of 1984 of the United Kingdom. Based on the recommendations made by a committee headed by Sir Cyril Philips, this Act streamlined police powers of arrest, detention and interrogation, by stressing the requirement for fairness, openness and workability. While this may be considered a laudable suggestion, one wonders how it can be carried out in Indian conditions where the police force consists of a vast mass of hardened musclemen (described once as the largest "single lawless group in the country" by Justice A N Mulla) who are totally ignorant of and indifferent to the laws of the land. As Justice Venkatachaliah has himself acknowledged, the majority of the complaints reaching NHRC relate to the police. Apart from arbitrary arrests, police torture and custodial deaths are the biggest blots on the Indian police system. These are compounded by the apathy – and often connivance – of the criminal courts. The judiciary at the lower levels is filled with equally ignorant and unscrupulous people (as acknowledged by Justice Venkatachaliah) who are supposed to dispense justice.

Clearly, India has to go a long way to reform its criminal justice system. It has not only to suitably alter the relevant provisions of the penal code, but also to radically change the mindset of its police personnel. It requires recruitment of better people and their training in the handling of cases in a fair and humanitarian way. The latest decision of the NHRC to establish human rights cells in state police headquarters could be a move in the right direction, provided these cells do not become yet another non-functional showpiece. There has to be a corresponding effort to carefully select and properly educate district and sessions judges in order to make the judiciary at the lower levels function independently and effectively, instead of being a handmaiden of a corrupt police force as it often tends to be.

GOLD DEPOSIT SCHEME

A Drop in the Ocean

A correspondent writes:

HOW is it that everybody is worried, quite rightly, about the scale of gold imports into the country, particularly since 1991, and still not asking the right question, about the advisability of allowing virtually unrestricted import of gold on private account? The union finance minister has proposed in his latest budget a scheme to mop up gold held in private coffers and hopes that through the scheme it would be possible for him to gather a sufficient quantity of gold to reduce "the need to import thousands of crores [worth] of gold every year". He expects lower gold imports as part of the domestic demand can be met through mobilising gold under his scheme.

Conservatively estimated, private gold holdings in the country may add up to not less than 15,000 tonnes (some estimates put the figure at close to 20,000 tonnes) which at prevailing international prices would be equivalent to $140 billion. This works out to be more than four times our present foreign exchange reserves. If the World Gold Council's estimates of gold imported by India in 1998 turn out to be correct, we would have imported gold worth $7.5 billion in a single year. This indicates how much of our foreign exchange earnings from exports of services as well as goods get diverted to a totally unproductive purpose. The question we really ought to be considering is whether to continue incurring such a high cost or revert to the ban on gold imports the way it used to apply before 1991, when the only quantity of gold legally possible to import on private account was on the basis of licences issued to exporters of gold jewellery. True, the one major consequence of such a ban was that the domestic price of gold tended to be vastly higher than the international price which encouraged smuggling of gold on a large scale. Naturally, this also meant that part of the exchange earnings of the country from exports of goods and services got diverted to financing such smuggling. Still the diversion could not have been anywhere near what is currently taking place to finance legal import of gold.

The scheme proposed by the finance minister is to authorise selected commercial banks to receive gold as deposits which will be redeemable in gold and which will carry a moderate tax-free interest on maturity. These deposits will also be exempt from capital gains and wealth taxes. The operational details of the scheme – the minimum maturity period, the rates of interest, varying perhaps with the period of the deposit, etc – have not been announce yet. What the finance minister has made clear, however, is that these deposits "will not enjoy [tax] amnesty".

Speculation is rife about how successful the gold deposit scheme will be in mopping up gold. The maximum officials are anonymously reported as hoping to mobilise under the scheme in 1999-2000 is Rs 5,000 crore, the gold equivalent of which at the current domestic price would be around 12 tonnes. Interestingly, the estimate of gold deposits likely to be mobilised is only marginally higher than the VDIS declarations in the form of gold and jewellery. Therefore even if the amount expected to be mopped up in gold deposits does reach the figure of Rs 5,000 crore, it may turn out to be a one-time collection, which may not recur year after year.

More important is that with a target of Rs 5,000 crore the scheme is unlikely to make any major dent on the import of gold. To be able to mobilise 10-12 tonnes in gold deposits is neither here nor there when the quantity imported is 800 tonnes a year. Isn't the finance minister claiming too much when he describes his scheme as "an extremely innovative idea"?

HEALTH

Shooting in the Dark

IN the last decade health has emerged as a major area of academic interest in the social sciences. Surveys and analyses of national data have thrown up an understanding of health care, health behaviour and health status of the people, which had not been available earlier. Many of these large research studies have been either sponsored or funded by governments which, more often than not, have been prompted to initiate them by international agencies. In sum, information on the quality of health care available, people's access to health care, their behavioural patterns and health status is no longer a matter of conjecture. There is sufficiently reliable information on the spread of diseases, their resurgence in certain areas, levels of patient care, availability of drugs in the system and so on. In the circumstances, why is it that the ministry of health does not access such information in planning its budget and charting the development of health care at either the central or state levels?

The annual exercise of putting up demands and being allocated budgetary support must indeed be a fairly simple-minded affair at the ministry of health. Over the last few years there have been any number of episodes of illnesses which direct attention to the need to strengthen the disease control programmes and the public health system. Yet allocations for public health continue to rise at an abysmal rate. Admittedly, health is a state subject and the central budget only defines the contours of a small part of the health plan for the year. Nevertheless, in the context of the changing epidemiological profile of the country, it is the most important part of a health plan. Central provisions for disease control programmes in most cases are to be supplemented by allocations from the state governments and therefore the actual amounts projected to be spent are not obtainable from the central budget. However, the central allocations play an important role in defining priorities and it is to be expected that these are planned on the basis on the latest data on the epidemiology of the disease. No such exercise seems to take place in the health ministry before demands are sent up to the finance ministry. Projections for the coming year appear to be worked out simply on the basis of what had been spent the previous year and the availability of grants from international agencies for particular programmes. For instance, while the resurgence of malaria has been much talked about, the budget provides just a 10.5 per cent rise in the allocation for the control programme. True, malaria takes away more than 30 per cent of the public health budget. This alone should prompt some thinking on a financial and performance review of the programme.

There is also evidence that centrally-managed disease control programmes are not the best way of controlling diseases. For instance, there are states or areas in states where malaria is not the major health problem. Under the present structure there is very little the states can do to change either the structure of the programme or its funding pattern. This should be prompting serious questions on the viability an efficiency of vertical, centrally-adminis tered programmes for particular disease Perhaps the case for making overall allo cations for health to the states and allow ing them to determine the pattern o spending according to their priorities need to be considered.

The case of the tuberculosis contrc programme is somewhat different and quit

pathetic. This programme has been much neglected in the past and has been revived only after the national AIDS control programme took off. This year even with a 44.8 per cent increase in the allocation, the programme still accounts for only some 14 per cent of the public health budget. Also, there is little reason to believe that the rise in the allocation has been prompted by the government's concern over the rising curve of the disease. Allocations for TB have shown no particular logic in the past.

The illogic of allocations in the health budget has been a long-standing feature. What is worrying this year is the finance minister's announcement that the central and state governments will provide matching funds for gram panchayats which will with their own contributions set up primary health care facilities. Given the disparities in levels of development across the country, is it not likely that gram panchayats in the better developed areas will be the ones who will come forward to set up primary health facilities, especially if, as the trend seems to be, fees for services/medicines are allowed to be charged? And as the government's own data show, it is the least developed regions which lack the minimum services which the state ought to be committed to providing to the people. Today more than at any time in the past it is possible to formulate and implement realistic health plans and programmes which may even provide health care for all by 2005, even if not health for all by 2000. But the government has to be capable of taking up the challenge.

SMALL SAVINGS

A Matter of Interest

IT is intriguing that although small savings collections have been delinked from the union government's budgetary operations by transferring transactions in small savings from the Consolidated Fund of India to the Public Account, interest on small savings continues to figure in the Consolidated Fund of India. Thus, in 1999-2000, out of the centre's estimated interest liability budgeted at Rs 88,000 crore, interest on small savings is put at Rs 18,235 crore, or over one-fifth of the total. There must be some strange logic why the finance ministry decided that while collections from small savings could be delinked from the centre's budgetary operations, this could not be done with respect to the interest due thereon. Possibly the ministry did not want the fiscal deficit figure to be brought down so very sharply in one go as would have happened if the interest liability were treated on par with small savings collections.

When some state governments had suggested to the union finance ministry in the Inter-State Council that the accounting procedure with respect to small savings collections be changed, surely they did not envisage that the centre would retain in its budget transactions in interest liabilities relating to small savings. One possible explanation why the centre has decided to continue the old practice with respect to interest on small savings could be that by doing so the centre can continue to make a profit by charging the states a much higher rate of interest on loans extended to them as the states' share of net small savings collections. The rate of interest charged to the states against such loans, which has just been lowered from 14 per cent to 13.5 per cent, is still much higher than the average interest cost the centre has to bear on outstanding small savings which works out close to 10 per cent. The state governments, as is well known, have been pleading with successive Finance Commissions against the exorbitant interest rate charged to them on their share of small saving collections.

Whether or not the states succeed in getting the centre to align the rate of interest charged on loans against small savings to the interest cost actually incurred by the centre, there is no reason why the interest due on that part of the collections which is transferable to the states should continue to figure in the centre's budgetary operations and therefore in the centre's fiscal deficit.

WOMEN

Unviable Scheme

THE General Insurance Corporation's 'rape insurance' scheme was a singularly ill thought-out proposal. Because of the haste and poor judgment of the government insurance company, a potentially useful scheme which would have offered cover to women at risk from a variety of hazards has now been rendered more or less unviable. Taken with the immediate response to it the episode throws up a disturbing glimpse of the distortions that progressive change can prompt.

The Rajeshwari Mahila Kalyan Bima policy, the GIC scheme as it stood when it was announced, was a ridiculous and callous attempt to 'compensate' women in distress. Launched by the prime minister on March 19 the scheme covered women in the age group 10 to 75 and offered insurance against disability caused by rape at an annual premium of Rs 15 for a period of one to five years. The extent of insurance cover depended on the degree of disability: the compensation for permanent disability would be 25,000 and Rs 12,500 for loss of a limb or eye. The scheme also offered insurance against disability caused from surgical operations, from snake-bites, drowning, murder and terrorist activity. Interestingly, the assessment of the degree of disability would depend on a doctor's report, a doctor of the insurer's choice. The scheme drafted by Oriental Insurance, originally meant to cover risks that women faced, included rape reportedly at the instance of the government.

It is hardly surprising that women's groups flayed the scheme – as they rightly pointed out, it seemed to acknowledge the inability of the government to prevent abuse of women and rape while offering compensation after the event. Even more shocking was the fact that the scheme would mean that the insurance company would arbitrate on the degree of 'injury' to the woman in order to assess the 'damage'. But more significantly, the scheme is based on the assumption that deciding on the extent of damage a woman suffers is a mere technicality, quite ignoring the long-standing debate in women's and legal circles on the issue of 'proving' a rape in court. Clearly, no attempt had been made to discuss the issue with women's groups. On a scheme aiming to offer compensation for injury specifically for women, surely, the perceptions and experience of groups working with women should have been drawn upon?

The GIC has now withdrawn the scheme and is said to be reconsidering it. However, the episode draws attention to the yawning gap between the projection of women's issues and their espousal in public and the unchangeability of social and cultural perceptions. It would be easy enough to chastise the government and the public sector insurance industry for using the issue of rape, a painfully traumatic event in a woman's life, for an insensitive political gimmick. The more difficult task is to ensure that in the current context of the state's dwindling welfare support to women, a scheme attempting to offer financial aid in times of crisis, such as injuries and accidents, is not allowed to fall by the wayside, and to actually invest it with wider scope.

CURRENT STATISTICS

***EPW* Research Foundation**

Exports have shown a sizeable fall in dollar terms in the first 10 months of 1998-99. Petroleum imports have also fallen by about 25 per cent, but because of the over 10 per cent rise in non-POL imports, the trade deficit has risen to $7.8 billion against $6.8 billion in the whole of 1997-98. Imports of chemicals and manufactured goods have declined, while capital goods imports have generally remained at last year's levels. It is the 'Others' category consisting of electronic goods, professional instruments and such new items which have contributed to the rise in imports. In exports, primary goods and gems and jewellery have stood their ground, while all other major exports, including textiles, have suffered a setback.

SRF

Financial Restructuring

IN order to capitalise on the liberalisation process, the company had zeroed in on industrial yarns, fabrics and fluorochemicals as its core business. The company disinvested its holdings in SRF Finance and SRF Nippondenso and acquired Ceat's nylon tyre cord plant in 1995 at a cost of Rs 325 crore. However, despite becoming one of the top players in the world in the nylon tyre cord segment after this acquisition, and having international level capacity, SRF was unable to post a satisfactory performance in 1997-98 While the company's net sales and operating profit were virtually stagnant, net profit plummeted sharply by 77.4 per cent following a steep increase in interest costs (up 12.3 per cent). Price realisation fell from an average of 231 per kg in 1996-97 to Rs 173 per kg in the year under review.

Meanwhile, as a part of its financial restructuring exercise, SRF has started retiring high cost debt. It received foreign currency loans worth Rs 108 crore from ICICI and DM, 18.9 million from IFCI and used the proceeds to repay ICDs, short-term debentures and short-term bank loans raised earlier. This move is expected to give the company some relief on the interest front which was one of the main factors affecting its performance in 1997-98. The company also tapped the capital market with a rights issue of Rs 48 crore.

SRF is currently India's leading manufacturer of nylon tyre cord fabric with a market share of 40 per cent in terms of sales, as also in refrigerant gases with a market share of 40 per cent. The company is also globalising its operations and for this purpose has set up a Rs 100 crore 8,000 tpa nylon tyre cord plant at Jabel Ali in Dubai. The plant was built in technical collaboration with Ayaha of Japan. The capacity of the plant is to be raised to 20,000 tpa soon. This facility is expected to help the company cater to the west Asian, African and European markets.

SRF has also become the only spinner in the country with fully integrated facilities including dipping. Also, it is currently a national leader in belting fabrics with a market share of 60 per cent, in addition to commanding a market share of 40 per cent in the fish twine segment. The company's fluorochemicals plant in Bhiwadi is a swing plant between chlorofluorocarbons and HCFCs and two-thirds of its production is exported to over 45 countries. It plans to develop new products as CFCs get phased out from the country. The company has hived off its ophthalmic lens business to a joint venture and has signed a marketing joint venture agreement in Paris recently with Essilor International SA, a world leader in plastic ophthalmic lens. The proposed name of the joint venture company would be Essilor-SRF Optics, and Essilor will be the majority shareholder with 74 per cent holding. This agreement will enable the joint venture to market advanced ophthalmic lenses in the domestic market.

CIPLA

New Export Markets

A leader in several segments in the pharmaceutical industry, Cipla has a diversified portfolio of brands. The company performed well in 1997-98 notching up a 13.8 per cent increase in net sales and a 20.3 per cent rise in operating profit. A sharp fall in interest charges (down 76.8 per cent) helped the company post a 44.1 per cent increase in its bottomline during the year under review. With earnings per share shooting up from Rs 35.4 to Rs 51, the company decided to raise the dividend rate from 35 per cent last year to 55 per cent. Cipla has had a generous payout ever since its inception. In fact, to date up to 92 per cent of its equity is made up of bonus shares issued earlier. No wonder the company enjoys a high investor fancy with its scrip quoting at a price to earnings ratio of around 26.5 times. It is also considered to be one of the most efficient pharmaceutical companies in the country today.

The company claims that its encouraging performance was mainly due to good margins on exports, rationalisation of product mix in the domestic market and its low interest costs. On the export front, formulations and bulk drugs contributed equally with the company exporting to the US, Australia, South Africa, Algeria, Yemen, Iran and Vietnam. The company introduced a range of sophisticated products during the year. These included Alerid-D (cetirizine, pseudoephedrine SR tablets) which is the antihistamine and decongestant combination for cold and congestion; and Amlopres L (amlodipine, lisinopril bi-layered tablets), a therapeutic advancement in hypertension management. It also introduced Aquatears (polyvinyl alcohol, povidone eye drops), a unique formulation for dry eyes; and Azee 1000 (azithromycin tablets), a single dose for management of STDs.

Meanwhile, for the first half of 1998-99, Cipla has posted a 20 per cent rise in net sales as compared to the corresponding period last year. Net profit too improved by 40 per cent over the same period. The company is targeting a turnover of Rs 575-600 crore for fiscal 1998-99 of which an amount in excess of Rs 100 crore is expected to come from exports. Exports have been a major focus point for the company and its policy of exporting high technology products contributed substantially to its overall profitability. In fact, Cipla overcame the decline in sales to the CIS countries and other setbacks by consolidating its presence in other international markets such as the US, Europe, Australia and regions of Latin America, Africa and west Asia. The company's exports, however, have been restricted due to the curb on export of new drug molecules unapproved by Indian authorities.

BLUE STAR

Market Leader

Airconditioning and refrigeration major Blue Star saw a mixed performance in 1997-98. While net profit was higher by 3 per cent over 1996-97, its operating profit declined drastically by 20 per cent. Only a sharp decline in tax provision (down 70.2 per cent) helped it post a 5 per cent increase in its bottomline during the year under review. The company maintained its leadership position in the central airconditioning segment despite subdued market conditions and a general liquidity crunch in the economy.

The company is now hiving off its software division into a separate company christened Blue Star Infotech. Though the software division currently contributes a mere 5 per cent of the company's total turnover, it is one of the fastest growing and most profitable businesses undertaken. The new infotech company will come into existence with a share capital of Rs 10 crore and shareholders of Blue Star will be given one share in the software company and three shares of Blue Star for every four shares held. The move to hive off the unit has been prompted by the fact that under Section 80HHE of the Income

Tax Act software exports can claim tax deductions only if exports are routed through a separate company.

Blue Star has signed a memorandum of understanding with the Agricultural and Processed Food Products Export Development Authority (APEDA) for setting up a cold storage facility at the Bangalore airport for cut flowers. The project envisaged a total outlay of Rs 1.2 crore and a total built-up area of 5,000 sq ft, inclusive of pelletisation facilities and would include phyto-sanitary and cargo clearance facilities. While Mysore Sales International, a Karnataka government undertaking, was expected to co-ordinate the project, APEDA was to fund the entire project.

Meanwhile, Blue Star is considering entering into a joint venture with US based York International Corporation for the manufacture of industrial refrigeration products. The two sides were first expected to conduct a feasibility study and a decision was to be taken only after that. While Blue Star is the largest player in the Indian industrial airconditioning segment, the US company is a global major in the chiller market. In fact the two sides already have a technical tie-up in place for about 15 years. Over the years, Blue Star has been introducing chillers, which is the heart of every airconditioner, through this tie-up. The current collaboration is for manufacturing centrifugal and reciprocating packaged chillers. These are manufactured at the company's Thane plant near Mumbai. The two companies are now planning to enter into a tie-up for the latest range of chillers, the screw chiller.

Blue Star, which has an installed capacity of 11 lakh airconditioning units at its Dadra plant, is planning to contract manufacture of components as well as finished products for its competitors. This will enable it to use the plant's idle capacity. The company's Dadra plant is currently operating at about 65 to 70 per cent capacity. The company is also planning to manufacture cooling coils, outdoor units for split airconditioners and window ACs for its competitors. Cooling coils are a vital input in every AC.

The company is now strengthening its cold room manufacturing base to meet the growing demand from hotels and multinational fast-food chains. For this purpose, it has recently entered into a manufacturing collaboration with the US based Kolpak, a leader in pre-fabricated PUF panels, besides its existing tie-up with US refrigeration equipment major Bohn since 1995.

Monetary Policy Hampered by Fiscal Inaction

The relatively credible programme of fiscal correction presented in the 1999-2000 budget, combined with low inflation and reduced credit offtake, has emboldened the Reserve Bank to try to bring down interest rates. However, the attempt is unlikely to revive industry in the absence of a sizeable increase in public expenditure and rapid expansion of bank credit.

I
Policy Developments

BOTH the *Economic Survey* and the Union Budget have predominantly focused on the need to reduce the fiscal deficit. If one aspect of the budget has acquired a degree of credibility (other than the reform of the excise taxes), it is the attempt made to contain the deficit by additional resource mobilisation through direct taxes and lower increases in expenditures and by dissociating from it the states' share of small savings collections. Even though symbolic, the establishment of a Guarantee Redemption Fund with an initial corpus fund of Rs 50 crore to help curb the growth of government's contingent liabilities fits in with the proposed medium-term strategy of attaining fiscal health; it is hoped that similar funds would be set up by the states.

In the altered composition of gross fiscal deficit of the central government, net market borrowings would now constitute the bulk (about 72 per cent against about 50 per cent in the recent past). For 1998-99 so far, the government has mobilised a gross amount of Rs 93,203 crore or a net amount of Rs 62,203 crore. However, the revised estimates for the year have placed the net market borrowing at Rs 64,911 crore, thus providing for a further cushion of Rs 2,708 crore. There is one more fortnightly floatation of 364-day treasury bills in March beyond the figures shown in Table 1 which may fetch about Rs 750 crore. Though the government has given out the market feeler that it is not planning to borrow anymore through dated securities this year, it is still contingent upon whether the use of ways and means advances remains within the limit of Rs 7,000 crore; as of March 5, they stood at Rs 6,853 crore. Even the tax revenue receipts up to February are reportedly behind those projected in the revised estimates.

For 1999-2000, the budget has provided for an estimated gross market borrowing of Rs 84,014 crore or a net borrowing of Rs 57,461 crore, that is, lower than the current year by about Rs 9,000 crore and Rs 7,500 crore, respectively. Though the size of market borrowings in 1998-99 was the highest ever, its immediate pressure on the financial system was mitigated to a considerable extent by the RBI absorbing as much as Rs 38,205 crore or 55 per cent of the net dated security borrowings. This was achieved rather smoothly by the confluence of a variety of factors: sizeable liquidity growth as a result of the Resurgent India Bonds (RIBs) and slower commercial credit growth. This, in turn, facilitated the RBI to unload on to the market, through open market operations (OMOs), securities worth over Rs 26,000 crore so far.

The relatively credible programme of fiscal correction, combined with low inflation and reduced credit offtake, has emboldened the RBI to reduce interest rates immediately after the budget: reduction of the Bank rate from 9 per cent to 8 per cent and the repo rate from 8 per cent to 6 per cent. The cash reserve ratio (CRR) has also been reduced by half a percentage point from 11 per cent to 10.50 per cent. Following these measures, some major banks have reduced their prime lending rates to 12 per cent and financial institutions to 13.50 per cent – reductions of about 0.50 to 0.75 percentage point each. While these may provide a boost to the business

psychology of the corporates, they are unlikely to help revive industrial activity which required an augmentation of the aggregate demand in the economy through a sizeable increase in public expenditure and rapid expansion of bank credit. Also, the above measures are on conventional lines, but the occasion demanded certain radical steps such as placing a cap on interest rates offered on bonds say, at 12.5 to 13 per cent, and bringing down the long-term rates of interest rather sharply to levels below those charged by banks for working capital. To facilitate the latter, the RBI could provide special refinance and rediscounting facilities to the FIs at the Bank rate or thereabout. Overall, a decisive thrust on bank credit and its distribution, and away from conventional monetary aggregates, is the need of the hour.

II
Call and Forex Markets

The call rates, generally ruling at 9-9.50 per cent, continued to be firm and stable almost throughout the month, except on reporting Fridays, because of the underlying tightness of liquidity (Graph A). This was evident from the RBI not receiving a single application for its fixed-rate repos for an entire week towards early February and for some days in mid-February. The liquidity squeeze came despite inflow of funds through interest and redemptions of government paper and repo reversals (Table 2). The tightness was caused by State Bank of India, the largest lender in the call market, remaining out of the market for almost 10 days during the month as it was reportedly diverting its rupee resources to buy dollars, either for the government or for some oil companies. At the end of the month, the two-day strike by bank employees on February 25-26 further contributed to the liquidity tightness. The NSE's Mumbai inter-bank offered rate (MIBOR) ranged from 8.01 per cent to 9.29 per cent and the bid rate (MIBID) from 8.51 per cent to 9.31 per cent during the month, with unusually low standard deviations. The unususal stability observed in call rates was evident from the simple averages of the rates remaining at 9 or 9.1 per cent for all the four weeks of the month (Tables 3 and 4). In the post-budget period, the RBI's announcement to cut interest rates and the cash reserve ratio (CRR) failed to bring down the call rate immediately.

Forex Market

Most of February was yet another period of calmness in the domestic forex market and stability in the rupee's exchange rate *vis-a-vis* the US dollar. The RBI's reference rate moved within a narrow range of Rs 42.40 to Rs 42.50 to a dollar for the first 24 days of the month (Graph B). Some additional dollar purchases by SBI were squared off against improved inflows of FII investments and invisibles. In trade-weighted terms, the rupee in fact appreciated by about 1.5 per cent both in nominal and real terms between January 29 and February 19. In the forward segment, banks and traders preferred short-duration covering and hence one-month premia firmed up and premia differentials considerably narrowed (Graph C).

There was, however, a small correction after the government of India's *Economic Survey* was released on February 24 which, with its observation on the need to monitor closely the value of the rupee to ensure that our exports continued to be price competitive in the light of exchange rate developments in competitor countries, set off speculation on the possible downward adjustment of the rupee value or even its free floatation after the central budget. For the next three days, the rupee rate slipped each day to trade finally at a low of Rs 42.70 on February 26. But, with the budget speech not signalling any drastic changes in the country's forex policy and with the RBI following up the budget with reductions in interest rates but without any easing of forex market regulations, forward premia fell in the process of adjusting to lower

interest rates In the spot market, corporates sold dollars and banks were forced to unwind their long dollar positions built earlier. As a result, the rupee gained ground against the dollar, with the RBI's reference rate touching Rs 42.51 to a dollar in the first week of March and Rs 42.43 in the second week.

III Primary Market

Dated Securities

The market received some respite during February as there was no fresh borrowing by the central government through dated securities – either by way of auction or by private placement. There was, however, the last tranche of three state government loans. The states of Goa, Andhra Pradesh and Uttar Pradesh put their 12.50 per cent 2009 issues on tap with no notified amount. After the state of Punjab successfully raised funds through an auction in January, a variant of the experiment was adopted in respect of these states, that is, leaving the amount of subscription to the market but at a fixed coupon. The experiment succeeded, with the state of Goa receiving the targeted amount in the first two hours of the tap opening, resulting in closing of the issue by 12.30 pm on that day. The other two states too received the targeted amounts in the next two days and the issues closed on the third and the final day of the tap. The three states together raised Rs 850 crore.

Treasury Bills

The yields on 14- and 91-day TBs showed a wide variation during the month For instance, the yield on 14-day bills alternated between 9.13 per cent and 9.39 per cent during the four weeks and the variation in the yields was despite the fact that there was no devolvement on the RBI or PDs in any of the auctions; it reflected unevenness in the pattern of bidding by the market caused by uncertainty on the interest rate front. It also indicated that the yields were completely market driven.

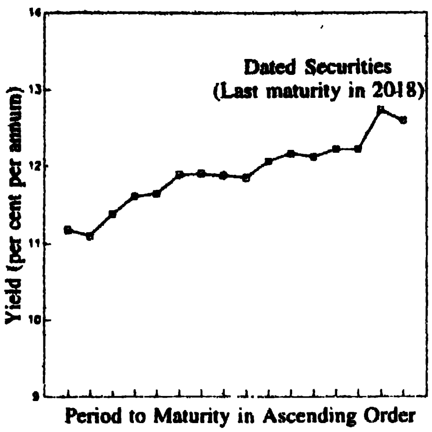
Figures in parentheses in cols 3 to 6 represent numbers and amounts of non-competitive bids which are not included in the total
Figures in the square brackets under cols 8 and 9 represent weighted average price and respective yield.
* Bracketed figures in col 7, if any, relate to devolvement on primary dealers, exclusive of RBI – No bid.

Graph E: Yield Curve for Dated Securities: Day of Maximum Transactions (February 24) During the Second Half of February 1999



The cut-off yield on 91-day bills was raised from 9.37 per cent in its first auction to 9.54 per cent in the subsequent three auctions and that on 364-day bills from 10.48 per cent on February 10 to 10.65 per cent on February 24. The notified amount for the latter paper has been kept constant at Rs 750 crore since January.

Commercial Instruments

According to data released by the RBI, commercial paper (CP) floated by corporates fell from the peak of Rs 1,215 crore during the fortnight ended January 15 to Rs 972 crore during the fortnight ended February 15 and further to Rs 762 crore in the next fortnight. The interest rates in the fortnight ending February 28 were at the shorter end higher by about 60 basis points reflecting uncertainties but were marginally lower at the longer end compared to interest rates of a month ago. Interest rates on CPs at 10.20-13.00 per cent during the latest fortnight were also significantly lower than 11.75-18.00 per cent on April 15 last year. With the lower interest rates induced by reduction in the bank rate and the RBI's repo rate effected on March 1, the CP market is expected to get a boost.

The data on Certificates of Deposits (CDs) released by the RBI pertained to November 6, 1998 when CDs outstanding had dipped to a low of Rs 5,858 crore as compared with the peak of Rs 14,584 crore as of April 10, 1998. There is hardly any activity reported in this paper but, with the year-end approaching, banks move towards window-dressing, and hence we may witness some activity in the CD market. Reductions in short-term deposit rates by some banks may also help the revival of the CD route.

Bonds Market

Buoyancy in the private placement segment continued unabated. The latest press release from Prime Database discloses that in the first nine months (April-December) of the financial year 1998-99, 124 institutions and corporates mobilised an amount of Rs 26,719 crore which represents a 6 per cent increase over Rs 25,127 crore raised in the corresponding period last year. Among these, the all-India FIs and banks topped the list with 55 per cent of the total mobilisation (Rs 14,592 crore) followed by state-level undertakings, 20 per cent (Rs 5,443 crore); private sector, 19 per cent (Rs 5,130 crore); PSUs, 5 per cent (Rs 1,403 crore); and state FIs, 1 per cent (Rs 150 crore).

If the previous month was dominated by debt issues from banks, the month of February was predominant particularly with state PSUs, and almost all of them

infrastructure-related. The government of Maharashtra's four Irrigation Development Corporation (IDC) issues, viz, Konkan (KIDC), Tapi (TIDC), Vidharbha (VIDC) and Godawari Marathwada (GMIDC), have all been oversubscribed. These issues collectively raised Rs 690 crore by offering 14.5 per cent coupon rate on five-year guaranteed bonds with yield to maturity at 15.03 per cent. Among the issues which were carried over from the previous month, KSEB and APSEB fared well to meet with the targeted amount, whereas, TFCI faced it tough mainly due to downgrading of its rating by ICRA from 'LAA' to 'LAA-'. Among the fresh entrants, SAIL too suffered from downgradation and could collect merely Rs 50 crore so far on its seven-year privately placed secured bond offering a better coupon of 14.5 per cent to raise Rs 300 crore plus Rs 150 crore as greenshoe option. Yet another PSU issue in the market facing tough time has been the LAA rated seven-year bond from Bharat Electronics (BEL). It aims to raise Rs 100 crore by offering 13 per cent rate of coupon which is the lowest by any PSU in recent times. A five-year NCD from ITI was oversubscribed to the tune of Rs 150 crore against the issue size of Rs 94 crore. The issue carried an indicative band of 12.9-13.4 per cent and the final rate was arrived at through book-building mechanism. In the PSU category were also present the issues from Hutti Gold Mines Company (Rs 10 crore plus over-subscription – already mopped up Rs 7 crore) and Damodar Valley Corporation (Rs 120.55 crore), both with seven-year non-convertible bonds. The former offered a higher coupon rate of 14.75 per cent and is guaranteed by the government of Karnataka, whereas the latter's un-guaranteed bond offered 13.5 per cent.

The Konkan Railway issue sailed through successfully due to its innovative structuring. This three-year paper carrying a coupon of 12.6 per cent has met with the proposed amount of Rs 50 crore; it is still in the market to garner the greenshoe amount of Rs 30 crore. Managed by Kotak Mahindra, the issue carried an 'American Put' which implies that investors can exercise a put option anytime after the specified lock-in period of one year by giving a notice of 30 days, 60 days or 90 days which would, respectively, be entitled to a discount of 0.5 per cent, 0.25 per cent or redeemable at par.

Among the financial institutions (FIs), the ICICI's Safety Bonds-VI closed on February 9 after collecting Rs 450 crore against the issue size of Rs 600 crore and is likely to hit the market early next month with same size and instruments except a new one in line with retirement bond named as 'Wise Monthly Income Bonds'. IDBI came up with Flexibond Series VI to raise Rs 750 crore plus an option to retain an equal amount of over-subscription. Except the Retirement Bonds, all the three instruments, i e, Regular Income, Growing Interest and Infrastructure bonds, have the same features as the last issue. The new instrument – Retirement Bond – has a face value of Rs 5,000 and minimum investment is four bonds. On the offer are three options of receiving annual payments by the investors after a specified wait period. The options are: (1) seven annuities of Rs 1,500 per bond from the end of third year (YTM: 13.79 per cent); (2) 50 per cent of principal amount back at the end of fifth year plus five annuities of Rs 2,085 per bond from the end of sixth year (YTM: 14.05 per cent); (3) 10 annuities of Rs 1,635 per bond from the end of fifth year (YTM: 14.13 per cent). The Infrastructure Bonds enjoy tax benefits under Section 88, 54EA and 54EB. The IFCI's 150 crore issue was oversubscribed and collected Rs 200 crore. It had the option to retain the over-subscription. On the offer were five-year and seven-year bonds offering 14 per cent and 14.25 per cent rates of interest.

Among the banks, Bank of India, Central Bank of India and Syndicate Bank came to market, raised the targeted amounts very smoothly and closed soon thereafter. Only one NBFC was present in the market, that is, Shriram Transport Finance Company, which offered a five-year NCD to the investors in the private placement segment. The issue has been rated AA by Duff and Phelps. The coupon rate is 15 per cent for one-year and 18-months; 15.5 per cent for two-year and 16 per cent for three- to five-year tenure. The amount it proposes to raise in not known.

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum * Yield rates of these sub-groups of t-bills and dated securities have been used for the graphs. Securities with small-size transactions and inflation linked bonds have been dropped from the above list but included in the respective totals.

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction.

2) Current yield has not been worked out for treasury bills.

In the private corporate sector, Tata Industries is a new entrant. This innovatively structured seven-year bond is optionally convertible in the sense that the investors have an option to covert the bonds into shares of Tata Teleservices after three years, and thereafter, after every three months. Deepak Fertilisers continued from previous month with its five-year NCD in the private placement.

Insofar as the closures are concerned, most of the issues were quite successful in meeting their targeted amount. Responses to bank issues in particular were overwhelming. Next month is to witness issues from NABARD (Rs 100 crore); Bank of Baroda (Rs 400+200 crore); Global Trust Bank (Rs 75 crore) and ICICI (Rs 300 + 300 crore). Also in the offing are issues from 12 state financial corporations (Rs 423 crore, collectively). All these bonds are going to be of 10-year tenure carrying 12.5 per cent rate of coupon payable half-yearly. None of the bonds has put/call option. The RBI has accorded SLR securities status to these guaranteed bonds issues. International Finance Corporation (IFC), a member of the World Bank group, is also in the waiting list to come out with 'rupee bonds' issue in the Indian domestic debt market. Though difficult to get since this kind of issue is not permissible under the present rules, approval to this effect from RBI, Ministry of Finance and the other regulatory authorities is awaited; if nevertheless granted, it would be the first of its kind in the country.

Securitisation

Jindal Vijaynagar Steel entered into a securitisation agreement with a European company for Rs 163 crore. It was also reported that SBI Caps has decided to float special purpose vehicles for securitisation of receivables from petrochemicals, power and telecom companies and housing rentals by the beginning of the next financial year. The RBI had asked ICICI to frame guidelines for securitisation of receivables to boost infrastructure financing. Meanwhile, Air India received a letter of comfort from the Union Ministry of Civil Aviation in order to help the airline securitise its future receivables on tickets worth $ 200 million.

Ratings Dilemma

In a surprise and debatable announcement, CRISIL has decided not to make public any longer the ratings issued for private placements of debt which is done at the instance of the issuer and investors. This has been done on the consideration that such ratings are extra-regulatory ratings; these are not mandated by the law and are only issued to give investors in these private placements an understanding of the credit risks. This statement has sparked a fresh round of debates on the 'accepted' versus 'unaccepted' ratings. 'Accepted ratings' are those that are issued by a credit ratings agency and accepted for use by the issuer concerned, while 'unaccepted' ratings are those that are issued by a rating agency but are not accepted for use by an issuer. Normally, all accepted ratings are made public while unaccepted ratings are never disclosed.

IV
Secondary Market

Dated Securities

In the initial part of the month, the sentiments in the government securities market were determined by the aggressive open market operations (OMOs) of the RBI. As upward revision was effected in the OMOs' price list, prices of dated securities moved up by 7-8 paise at the shorter end. In the subsequent weeks, liquidity shortage affected the government securities market. The outright transactions thus steadily declined (Appendix Table). The weighted YTM, which fell from 11.36 per cent to 11.24 per cent in the second week, picked up to 11.32 per cent and further to 11.41 per cent in the subsequent two weeks as the prices became subdued. As a result of the impending central budget and monetary policy changes, the focus of the market was on the shorter end and hence, the yield curve became relatively flat, particularly in the second half of the month (Graphs D and E).

Open Market Operations

Due to a general shortage of short-term liquidity, the RBI's OMOs during February (Rs 2,590 crore) were not as successful as those of January (Rs 5,092 crore). Even so, overall, the RBI has succeeded in unloading a substantial amount (Rs 26,000 crore) out of its load of government paper. This has been done by progressively raising the yields offered: thus the weighted average of yields during February for the OMOs securities was 12.35 per cent against 11.45 per cent in January. The OMOs were once again active on the budget day when the finance minister indicated towards an interest rate cut. The RBI used the OMO price list to step up yields furher after the interest rate cuts were announced on March 1 by placing long-dated securities (2010 and 2013) on its sale list at prices lower than those in the market. The response to RBI's fixed-yield repos continued to be lukewarm as the call rates remained firm (Table 8); so were to the repos outside the RBI (Table 9).

Bonds and Other Instruments

The secondary market transactions in PSU bonds and CPs in the month were considerably less than the normal (Table 10).

Enron Revisited

Madhav Godbole

With the commissioning of the first phase of the Enron power project in Maharashtra shortly, several issues critical to the management of the power system in the state will now have to be grappled with to ensure that the state electricity board's financial viability is not further undermined. What is specially significant is that these issues have to be faced in the changed context of the share of power generations by independent power producers going up very substantially in the coming years.

WITH the commissioning of the first phase of the highly controversial Enron power project in Maharashtra shortly, one chapter of the epic struggle against this project will be over but the other, more challenging one, is about to begin. Several issues which have been agitating the minds of objective observers and the general public will now have to be grappled with in managing the power system in the state. This is all the more relevant keeping in view the fact that the share of power generation by independent power producers (IPPs) is due to go up substantially in the coming years. It is estimated that by 2002, Maharashtra would have a total installed capacity of over 19,000 MW. New projects being set up by IPPs – Enron through Dabhol Power Company (DPC), Reliance Industries and Nippon Dendro Ispat – between them would account for 57 per cent of the capacity addition, the balance being added by the Maharashtra State Electricity Board (MSEB) (36 per cent) and the central pool (7 per cent). It is therefore, appropriate that the issues arising from this changed context are discussed at some length to ensure that MSEB's financial viability is not undermined further.

At the outset, a note must be taken of the significant events which have unfolded more or less simultaneously with the impending commissioning of this large base-load power project. First, the Congress Party, which by all indications is poised to come back to power at the next elections scheduled to be held in February 2000, has announced that it will review – and possibly slash – the rate at which the state electricity board purchases power from Enron's Dabhol plant. Second, the state government has reduced the per horse-power tariff for agricultural sector substantially in defference to the wishes of Shiv Sena chief Bal Thackeray. This has imposed an annual burden of Rs 181 crore on MSEB. The state chief minister has announced, "This is the first phase. In the second phase, we are considering providing free power to the farmers"! Third, even with the concessional agricultural tariff which prevailed in the state, the arrears from agricultural consumers have gone up to Rs 850 crore. The state government has announced that agricultural consumers who pay 50 per cent of their arrears before May 31, 1999 would be exempted from paying the rest of the amount. Fourth, the state government has categorically announced that the electricity supply to farmers will not be disconnected even if they do not pay electricity dues. Fifth, the arrears of electricity charges from local self-government institutions such as gram panchayats, municipalities and municipal corporations total over Rs 500 crore. The state government has announced that if these bodies pay 10 per cent of the arrears, their power supply will not be disconnected by MSEB. Sixth, in a writ petition filed by the Thane-Belapur Industries' Association against steep increase in industrial tariff, when large concessions are being given to certain other categories of consumers, the Bombay High Court has, in an interim order, directed the state government this month to set up a state electricity regulatory commission expeditiously and to refer the tariff increase for industrial consumers to it. However, if such a commission is not set up, MSEB has been directed to apply to the court if any further increase is to be effected in tariff. Unfortunately, this order applies only when tariff for any category of consumers is to be increased and not if any concessions are to be given to the consumers!

Among the various main doubts raised about the Enron project was the reservation whether the state was in need of such a large addition of capacity to its base load power generation. These objections were considered unfounded by MSEB and the state government. Even the centre, which was backing this project strongly throughout the negotiations, had overruled this objection. Recent reports show how valid were the fears expressed by the so-called detractors of this project, including this author. Union power minister P R Kumaramangalam has admitted that, "States like Maharashtra are now looking for buyers to contract out the expensive [Enron] power they are burdened with". Hinting at high cost power like that of Enron, he said that, in many cases, paying the penalty of fixed charges will be cheaper than paying for the expensive power. The minister further said that these states (like Maharashtra) which had taken upon themselves an obligation to provide off-take of power generated by projects like Enron, may find it difficult to get takers for expensive power. Even power deficit states like Uttar Pradesh, Delhi, etc, are now realising the emerging trends and are expected to wait for better deals. In fact, some of the SEBs have drawn up interim plans for the transition period where they are planning to improve the efficiency of the existing plants to meet the short-term shortfall. This is all the more disconcerting in the face of the claims of the union power minister that power tariffs of new mega power projects are set to come down by as much as 50 per cent (*The Economic Times*, January 5 and 8, 1999).

It is unfortunate that all those who were involved in the clearance of Enron project did not pay adequate attention to the fact that Koyna hydro-electric power project phase IV for peaking power generation of 1,000 MW is scheduled to be commissioned in the middle of 1999, more or less simultaneously with the Enron project. Several small hydro-electric projects are expected to add a total of another 90 MW of peaking support. This will more than wipe out the peaking power shortage in the state.

The industrial recession has, no doubt, been partly responsible for reduced rate of growth of demand for power in the state. But this does not explain fully the excess availability of power with the two private sector power distributors in Mumbai. There is already 400 MW surplus power with the Tata Electric Company (TEC). According to some news

reports, Tatas are expanding their distribution network by offering power supply to the erstwhile consumers of Bombay Suburban Electric Supply (BSES). The fight over consumers and lower power tariff has now been taken to the state government for arbitration. Some may consider this a cause for rejoicing but permitting large capital assets to be kept idle due to excess capacity is a luxury which a capital poor country such as India can hardly afford.

Backing down in MSEB's power stations which supply power at a cheaper cost will be the inevitable result of committing guaranteed offtake of power from IPPs at unduly high plant load factor (PLF). It is unfortunate that its full implications for the finances of MSEB are still not appreciated fully by the board. This is evident from the comments of the chairman of the board as brought out in the article entitled 'Enron India and a Problem of Plenty' (*Business World*, December 22, 1998, January 6, 1999). It is difficult to subscribe to the statement of the chairman of MSEB that "backing down our own plants will be cheaper".

MSEB's overall financial position is highly precarious due to large subsidies in power tariff for agricultural consumers as also domestic users and local self-government institutions. The loss in revenue is partly made up by higher tariff to industrial consumers. In such a situation, it is hardly appropriate for MSEB to permit captive power generation as it implies foregoing large revenue. Against this background, it is difficult to understand how MSEB and the state government has permitted captive power generation capacity of 164 MW to be set up in the state by Reliance (48 MW), Larsen and Toubro (46 MW), Lloyds Steel (30 MW), and Indo Rama Synthetics (40 MW). Inexplicably, the state government has also permitted the Reliance Industries to supply power to two major industrial units in Thane-Belapur area directly from its proposed Patalganga power generation project, instead of selling all the power to the state grid. This is likely to lead to an annual loss in revenue of Rs 100 crore for MSEB.

In the same vein was the decision of the state government to give further concessions to Reliance Industries for its Patalganga project a few months ago by relaxing the earlier power purchase agreement. The levellised tariff for purchase of power by MSEB is reported to have been increased from Rs 1.41 per unit to Rs 1.48 per unit. Cover against exchange rate fluctuations has also been enlarged.

A reference may also be made to the observations of the Comptroller and Auditor General (C and AG) contained in his audit report on government of Maharashtra (No 2, commercial) for the year ended March 31, 1997. It states, "The PPA [power purchase agreement] with RPPPL [Reliance Industries] was entered into in August 1996 for setting up a gas based plant with a capacity of 410 MW at Patalganga. The location of the power plant was changed from Nagothane to Patalganga, after award of project. Though reduced completion period of 24 months as against 36 months initially quoted was one of the reasons accorded for change in location, corresponding reduction in interest during construction (forming part of project cost) was not given resulting in undue benefit of Rs 20.90 crore per annum to RPPPL in the form of higher capacity charges" (p xi). Obviously, no lessons have been learnt from the monumental mistakes made in approving Enron project. MSEB and the state government continue to be as lax as ever in protecting the interest of the state and its electricity consumers.

There seems to be no long-term perspective in the state government regarding the restructuring of the power sector. Its actions and pronouncements so far are ad hoc and arbitrary. Over a year ago, the state government announced its intention to set up a state electricity regulatory commission but there has been no further progress. The comprehensive recommendations made by the Rajadhyaksha Committee in December 1996 on restructuring the sector are gathering dust. Instead of looking at privatisation of distribution in the state as a whole, MSEB and the state government seem to be toying with the idea of privatising distribution selectively. Accordingly, MSEB has commissioned a study for privatisation of distribution in New Mumbai. Needless to say, any such piecemeal action will mean MSEB forgoing profitable areas of distribution and remaining saddled with loss-making rural and semi-urban areas of the state.

The Enron imbroglio will be remembered for a long time for the futility of public interest litigation (PIL) which has otherwise been such a powerful tool for redressal of public grievances and checkmating the excess and arbitrary actions of the executive. Inexplicably, the high court, while dismissing the first PIL at the admission stage itself, came to the conclusion that, "We do not find any material or evidence to substantiate the contention of the petitioners that the contract in question is arbitrary or illegal or against public interest. On the contrary, all the facts and circumstances indicate the contrary... The grievance of the petitioners is based on the sole ground of the failure to follow the usual procedure of inviting tenders, which as stated by us earlier, is not an invariable rule. In our opinion, in the present case, it may not be an appropriate mode. Negotiation was the only appropriate mode which has been done in the most reasonable manner. The decision has been arrived at after long deliberations and discussions and consideration of all relevant factors" (AIR 1995 Bombay 235). It is unfortunately true that each of these observations can be contested on very valid grounds.

When the matter was agitated in the same court through two PILs in 1996, the court refused to intervene by citing the rule of *res judicata* and observing that it is not a technical rule but it is a rule of public policy (AIR 1997, Vol 84). Some of the observations of the court are, however, worth recalling. The court,*inter alia*, stated, "But once it [Shiv Sena-BJP coalition government] decided to revive the project, it acted in the very same manner as its predecessor in office had done. It forgot all about competitive bidding and transparency. The only transparency it claims is the constitution of the negotiating group. The speed with which the negotiating group studied the project, made a proposal for renegotiation which was accepted by Dabhol, and submitted its report is unprecedented. The negotiating group was constituted by the Government of Maharashtra on 8th November 1995. It was asked to submit its report to the state government on 7th December 1995. The committee, we are told, examined the project, collected data on various similar other projects as well as internal bids including data on a similar project executed by Enron in the United Kingdom, held considerable negotiations, settled the terms of revival of the project, got the consent of Enron and Dabhol to the same on 15th November 1995, just within a week of its constitution, and submitted its exhaustive report along with data and details to the Government of Maharashtra on 9th November 1995, just 11 days after its formation, much before 7th December 1995 by which date it was required to submit the same. The speed at which the whole thing was done by the negotiating group is unprecedented. What would stop some one to say, as was said by the chief minister in the context of the original power purchase agreement, 'Enron revisited, Enron saw and Enron conquered' – much more than what it did earlier" (p 107).

Everything about this project has been unprecedented. It was not therefore surprising that the negotiating group, which comprised experts, failed to go into a number of major issues pertaining to the project which were agitating the public mind. One of these, for example, pertained to the guaranteed offtake of power by MSEB by permitting the project to operate at a very high PLF. It was repeatedly urged in the public criticism that this will imply MSEB backing down its own low cost power stations. It was unfortunate that this was not gone into by the negotiating group with reference to any load flow studies. In any case, such studies do not form part of the report of the negotiating group. *The Summary Report of the Negotiating Group on Dabhol Power Company*, which was released for public information, merely states that "with a view to assess the load situation in the state, both present and future, the committee relied on actual load study available from MSEB which is attached *vide* Annexure X" (p 12). However, what is contained in Annexure X is daily system report for October 31, 1995, system status during peak periods and night off peak periods for the same date, planned and emergency outages on units and trippings, generation overview, etc, again for a particular date. On page 13 of its report, the negotiating group has made yet another cryptic observation that, "in addition, the committee also conducted a study on optimum operating cost minimising load factors from various generating stations in the state and are satisfied that the proposed load factor is justified". It is surprising that the negotiating group did not consider it fit to provide any data in its report to support its observation on such an important issue which will have a vital bearing on MSEB's financial health in the coming years. Obviously, the committee's conclusions on this point were erroneous.

The implications of the perceptible increase in the pooled cost of generation of MSEB after Enron power is received in the grid were not gone into by the negotiating group at all. The discussion in the report in terms of levellised tariff rather than the estimated yearwise tariff of Enron (based on some clearly spelt out assumptions) failed to bring out the seriousness of the problem. It is necessary to underline that what matters for policy decisions is the actual tariff at which power will have to be purchased by MSEB from Enron from month to month. For example, according to the C and AG report referred to earlier, "the expected cost of power from DPC [Enron] and RPPPL that would be available for sale by MSEB is Rs 4.69/KWh and Rs 3.71/KWh respectively, in March 2001 as against expected average realisation of only Rs 2.40/KWh based on average realisation in 1995-96 and cumulative average rate of growth of 8 per cent over five years". As it appears now, the state government will be unwilling, or may find it difficult, to revise the tariffs payable by consumers adequately to compensate MSEB for the high cost power of Enron and other private power projects which are due to go on stream in the next two years. In the light of the high court judgment referred to earlier, the state government will have to either approach the state electricity regulatory commission, if it is established by the state government, or it will have to approach the high court for giving effect to the tariff increase.

A reference may be made in this context to the provisions of the Electricity Regulatory Commissions Act, 1998, which provides that in the discharge of its functions, the central commission shall be guided by such directions in matters of policy involving public interest as the central government may give to it in writing. If any question arises as to whether any such direction relates to a matter of policy involving public interest, the decision of the central government thereon shall be final. Similar powers have been given to the state governments in respect of the state electricity regulatory commissions. These are wide and sweeping provisions and could be easily invoked to nullify any actions of the regulatory authority. This is amply evident from the recent decision of the central government to keep in abeyance the telephone tariff notified by the telecom regulatory authority of India (TRAI). If the stand of the central government in respect of the powers of the TRAI in regard to the revision of telephone tariffs is any guide, it is doubtful whether such regulatory authorities, whether at the state or central level, will have any freedom to fix reasonable tariffs from time to time. In fact, the very purpose of setting up such regulatory authorities for various sectors is likely to be frustrated by the centre's stand in respect of TRAI.

An independent comprehensive post evaluation of the highly questionable decisions to award 'fast track' power projects to IPPs and subsequent decisions of government of Maharashtra to impoverish MSEB will put the issues in proper perspective and provide useful guideposts for the future.

Akalis' Secular Turn

A S Narang

The Akali Dal tradition has been that whenever it is out of power, all factions join hands and speak a belligerent language; and when it is in power there is a power struggle in the party. The present feud between Parkash Singh Badal and Gurcharan Singh Tohra can be seen both as a continuation of this Akali tradition and something different in the present context of Punjab and Indian politics.

SINCE the reorganisation of the state in 1966, the Shiromani Akali Dal (SAD) is in power for the fifth time in Punjab now. It has been in power by itself or in coalition with other parties. Every time it has come to power, factionalism in the party has come in the open within one year and culminated in the division of the party. The present feud between Parkash Singh Badal and Gurcharan Singh Tohra can be seen both as a continuation of this Akali tradition and something different in the present context of Punjab and Indian politics. One major difference this time is that there is no immediate threat to the Badal government. This is partly due to the brute majority of the Akali Dal in the assembly in which defection of even 20 plus members is covered by the anti-defection law. There is also a change in the power alignments within SAD.

No doubt there has been an overall decay of the democratic system in the country. This decay has been marked by personality based politics, corruption and cynical manipulation of issues and people. Punjab is no exception to that. Here, also, different parties, groups and individuals scramble for power, unmindful of sound political values or social concerns. However, in view of the peculiar demographic situation of Punjab, the popularity of the mythical doctrine of amalgamation of religion and politics in the Sikh faith and the experience of militancy during the 1980s, the present nature of Akali factionalism can be interpreted in different ways and its effects on the future of Punjab can be predicted accordingly.

A reference to the historical and social context can help in the better understanding of the situation. In its origin, the SAD was the product not of politics of the state but of the church embodied in Sikh gurudwaras. It was formed in December 1920 as a co-ordinating agency to raise and train volunteers for action in what is known as the Gurudwara Reform Movement to take gurudwaras out of the control of the 'mahants' (priests) who were managing them as their personal property in the most corrupt manner. Right from the early days of its inception, SAD was facing internal differences with regard to modes and strategies of agitation, its ideology and leadership. Some saw it purely as a religious movement to reform the gurudwara management, others looked upon it as a part of the larger movement for the freedom of the country. Yet others linked it with the revolt of the peasantry.

On the whole, in the given situation, the Gurudwara Reform Movement, which got statutory recognition for the Shiromani Gurudwara Prabandhak Committee (SGPC), not only succeeded in freeing the gurudwaras but also played an important political role in the institutionalisation of Sikh politics. The SGPC and the Akali Dal ultimately emerged as the primary institutional expressions of the communal and political consciousness and the identity of the Sikhs.

In conceptual terms, the SGPC can be described as a political system or organisation which looks into a range of Sikh affairs. It deals with the different Sikh sects and the Punjab government. It also has huge assets. Control over the SGPC provides control of the material and symbolic assets of this organisation. Elections to the SGPC are conducted by the state and anybody or any party can contest them. The Akali Dal, on the basis of its historical role, has been gaining control over th SGPC by articulating or even over-articulating the traditional ethnic political aspirations of the Sikh community. The Akali Dal has been presenting itself as the only representative body of the Panth.

As the proclaimed sole spokesman of the Panth, the Akali Dal has been suggesting that Sikhism, unlike most other religions, is not merely a way of worship but also a social system. As soon as the Sikh people are deprived of political power, Sikhism becomes distant from its elan and ethos. This move toward political power, however, brings out class, caste, family, economic, secular and political differences. Sikhs, as any other community, are not a homogeneous community. There is a division between rural Jat Sikhs and urban Khatri-Arora Sikhs leading to the clash of interests between farmers and traders as also between urban and rural social values. Among the rural Sikhs, there is a sharp division between Jat farmers and scheduled caste landless or small kisans. Here class-caste differences coincide.

Till early 1960s, SAD was under the leadership of urban Sikhs. Although the rural Sikh farmers supported SAD for SGPC elections, they generally supported the Congress for the legislative assembly elections. Later, due to the change in Congress policies, the Jat Sikhs, like other farmers of north India in general, started moving away from the Congress. They took over the Akali Dal after a formal division between the Master Tara Singh and Sant Fateh Singh factions. Since then, SAD has primarily been representing the farmers' interests as far as legislative politics is concerned. However, within farmers, class differences on the basis of old family feuds, personal ambitions, big, small and middle farmers do exist. In this situation, both individual and factional leaders attempt to capitalise on Sikh doctrine in which subordination of the individual will to the collective will is complete. The general will here exists as a real will and not merely as metaphysical fiction as a result of the belief that the Guru is present in the Khalsa (community) and the opinion of the community is the will of the Guru. It is from this doctrine that the concepts of Sarbat Khalsa (assembly of the whole community) and Hukumnamas (edicts of the Akal Takht which has members nominated by the SGPC) have been derived.

Until the beginning of the 1980s, all these tactics were used moderately and polemically as, in spite of the religious orthodoxy, economic and social differences among the Sikhs have been real. For the Jat Sikhs particularly, the association with religion has been more in sociological than metaphysical terms. Their behaviour is governed more by the instinct of tribal freedom and tribal kinship than other worldly concerns for heaven or hell. In view of this, the Akalis had

started moving towards moderation and secularism. During the Emergency and in the post-Emergency elections, the co-operation between the rural-oriented Akali Dal and the urban-based Janata Party was quite impressive. Tohra occasionally spoke in a controversial language, but Badal was able to establish the party's secular credentials significantly as the chief minister.

Soon after the 1972 elections, the Congress, however, started to play the game of one-upmanship *vis-a-vis* the Akalis in the use of religion. One reason for this was that the Congress chief minister, Giani Zail Singh was not a Jat. For his survival, he projected himself as the promoter of Sikh religion. At the same time, by now Indira Gandhi's Congress had started using the politics of communalism. In Punjab, apart from appealing to Sikh sentiments, it also began to exploit factional conflicts among some Sikh sects and the Akali role in these. One sect that came handy to the Congress was the Damdami Taksal headed by Sant Jarnail Singh Bhindranwale.

Pressures on the Akalis were mounting from other sides also and these were causing differences between the ecclesiastical-organisational axis and the legislative wing of the Akali Dal. At the time of the 1979 SGPC elections, it looked for a moment that the MLAs led by Badal and the followers of Tohra and Talwandi would fight to the finish. By encouraging organisations like Dal Khalsa and Bhindranwale, the Congress not only started creating an alternative centre of power in Akali politics but also sharpened the factionalism in the Akali Dal. To become the spokesmen of the Sikh community, leaders and factions started blowing up Sikh grievances in a belligerent language. Indira Gandhi obviously allowed the situation to drift and take a serious turn.

Caught in a cleft-stick and facing a two-pronged attack, the moderates in the Akali Dal became irrelevant. To justify their acts of omission and commission, the supporters of the government, the militants and the Akalis reinvented the institutions of Sarbat Khalsa and Hukumnamas as well as the political role of the head priest (Jathedar) of the Akal Takht from the Sikh traditions according to their own conveniences. The price that the country, the state and the Sikhs paid for this politics of opportunism is well known by now. After the 1984 events, the Sikh masses looked upon the Akal Takht as a symbol of their identity. Within Akali factions, the control over the Akal Takht became important.

After the decline of militancy and the restoration of the democratic process, a large section of the Akali Dal began to realise the futility and dangers of confrontation for the sake of confrontation. They were worried that the extremists could take charge of the Akali Dal and isolate them besides inviting ruthless repression by the state. Moderate Akali reassertion received mass support. The Akali Dal, however, always remained in a dilemma. The line which separates religion from politics is blurred and the Akali Dal cannot easily give up its religious appeal. The gurudwara-based Jathedars have to play a role. On the other hand, the demographic structure of the state is such that it is difficult for the Akali Dal to form the government by itself without support from significant sections of Hindus. It is in this context that there is always a conflict between the ecclesiastical-organisational axis and the ruling political group.

Traditionally, in Akali politics there have been three power centres revolving around the party president, the SGPC president and the leader of the legislative wing who becomes the chief minister whenever Akalis form the government. Since 1985, after the assassination of Sant Harchand Singh Longowal, the same person has been the leader of the legislative wing and the party president. Earlier it was Surjit Singh Barnala and now it is Badal. This is another cause of dissatisfaction in a section of the party. Tohra, who is known for his political manoeuvring capabilities and has always remained with the mainstream Akali Dal in spite of his somewhat extreme views, thought that he could articulate the dissatisfaction in some organised manner. Badal, confident of his position in the assembly and the support of the BJP, decided to consolidate his position in the SGPC also. In spite of the reconciliatory efforts made by some Akali leaders and Tohra himself, he not only got Tohra ousted as the SGPC president in a humiliating way but got a person completely of his choice elected in his place.

The election of Bibi Jagir Kaur as the first woman president of the SGPC seems to be a well calculated move. It will not be too easy for Tohra and his supports to oppose a woman. At the same time, Jagir Kaur, a minister till yesterday, will in all probability be a proxy president. It is significant that at the election meeting on March 16, Akali leader K S Badungar opened an envelope which contained Badal's message to the members giving the names of those he wanted elected to the respective posts. The message was faithfully accepted.

There are both negative and positive aspects of this development. Moderation is regaining support in the Akali Dal. The clergy's overindulgence in politics is being questioned. Here, it may be mentioned that Jathedar Ranjit Singh, the recently suspended chief priest of the Akal Takht, in his short tenure in the last few years, issued more Hukamnamas than proclaimed in the last 50 years or so. People like Tohra, who keep on harping on concepts such as that Sikhs are a separate nation, stand isolated. Already other such leaders, like Simranjit Singh Mann, have been marginalised.

How genuine and honest is this effort? The past history of the Akali Dal, including Badal's own behaviour, is not promising. In 1969, when the moderate Justice Gurnam Singh was leading the Akali-Jan Sangh coalition government, Badal led the revolt against him in somewhat emotional religious language. Again when in 1985 Barnala became the chief minister, Badal not only criticised the Rajiv-Longowal accord but also warned Barnala on the issue of sending police to gurudwaras. The Akali Dal position has been that whenever it is out of power, all factions join hands and speak a belligerent language. When it is in power, there is a power struggle within the party. Reports of Badal monopolising all power for himself and his family members are quite credible. Tohra's allegation that Badal is grooming his son to succeed him is not without basis. People in Punjab are talking about widespread political corruption in the administration. The names of family members of Badal are openly mentioned in this regard. Badal's son, who is new in politics, has got a place in the central ministry. Badal, in spite of his career-long opposition to the retention of Article 356 in the Constitution, supported its proclamation in Bihar.

There are apprehensions that, as in the past, this internal factionalism of Akalis will bring militancy and violence back. But, as mentioned above, Punjab society is unlikely to approve of that. Much will also depend on the role that other parties and groups like the Congress play in their own political interests. The media and Sikh intellectuals can use this situation to get the Sikh masses out of the control of Jathedars and gurudwara-based politics.

Derailing the Railways Further

S Sriraman

A reading of the railway budget, 1999-2000 reveals that the ministry has failed to evolve a coherent and effective strategy for capacity enhancement and technological upgradation so that the railways can play a relevant role in the next century in the country's development.

THE Status paper on Indian railways (GOI 1998a) brought out by the ministry of railways last year had raised hopes of significant measures to put the organisation back on the rails in order that it may support the high growth path that has been envisaged under a liberalised economic framework. It was thought that railways would be radically reorganised and that public authorities responsible for the rail sector would play a highly active role in that process. Serious attempts made by the minister himself and his officials to build up a consensus on the need to evolve an effective strategy that would involve massive investments in capacity enhancement and technological upgradation of the railways have apparently failed as is revealed by a reading of railway budget for 1999-2000 presented to parliament last month. When read together with the recently released Ninth Plan document which, in a rather limited way, seeks to provide a sort of a blueprint for survival and even growth of the railways in the next millennium, the feeling is one of utter disappointment.

The objective of the Ninth Plan as far as the railways is concerned "would be on strengthening the capacity of the Indian railway system as the prime carrier of long distance bulk freight and passenger traffic. To this end, the railways will concentrate on multiplexing and electrification of dense corridors, improvement in reliability of operations, containerisation of smalls and optimisation of total system operations." The budget, which could have served as a springboard to operationalise a strategy to launch the network into a high growth trajectory and become part of the renaissance of the rail industry globally, attempts precious little.

A dynamic tariff policy is a necessary precondition for successful growth of even a public service organisation like the railways. However, tinkering with passenger and freight tariffs in an arbitrary way has been a characteristic feature of tariff fixation in the Indian railways. This has happened despite recommendations of several expert committees [GOI 1980, 1993] who have opposed this policy since such a policy upsets the rate structure which is normally expected to be based on certain perspectives reflecting relative costs, class rates, traffic leads and socio-economic importance of different commodities. The minister has proposed a 4 per cent across-the-board increase in freight tariff at all distance except up to 50 km in which case a 25 per cent concession has been offered. This concession is sought to be justified on the ground of weaning away short-haul traffic from road transport. Again, in this context, while the move to introduce new long-distance trains may possibly be welcomed, the introduction of new short-distance intercity trains is a retrograde step especially in view of the effective road transport connections available between these points. Such efforts severely undermine the evolution towards an optimal modal mix.

In the case of passenger fares, a rationalisation to take into account differences in the levels of comfort as between sleeping and sitting accommodation as also the superior comfort of travel in airconditioned classes has been proposed. As a result, fares will be varying between 1.55 times the basic second class fare for the sleeper class to 14.4 times the basic fare for AC 1st class. While implicit in this scheme of things is consideration of cost factors, more explicit are demand considerations which have, historically, served as the basis for the value of the service pricing principle adopted by many systems all over the world. On the Indian railways, passenger traffic is traditionally classified as suburban and non-suburban. For historical reasons, what is called suburban traffic is concentrated mainly in the metropolitan cities. The non-suburban traffic is carried by four types of passenger trains: (i) ordinary trains, (ii) mail and express trains, (iii) superfast trains, and (iv) special categories of trains called Rajdhani and Shatabdi trains. The classification of intercity trains into these four categories plays an important role in fixing the level and structure of long distance fares on Indian railways since differentiation in train categories is based upon the quality of service factors, the main items of which are journey time, departure and arrival timings, number of halts, the type of seating or bedding supplied, the position of dining car or pantry car and other amenities. Thus, these factors form a logical basis for charging differential fares even for travelling similar distances. In other words, variation in fares while it is reflected in the variation in costs of service provision, it is more so due to a consideration of affordability of the users to pay different fare levels. However, it does appear that a stage seems to have been reached where not much leverage is possible at the higher end of the spectrum of fares since diversion to the road mode is emerging. This is revealed by stagnating upper class flows. It may still be possible to target the long distance second class sleeper segment for additional revenues since growth continues to be buoyant.

In the White Paper on the railways projects (1998b) brought out last year, the ministry had focused on the issue of expansion of the railway network, which was proceeding in terms of a number of financially unviable but, socially desirable projects. It was also reported that many of these were included in past budgets without proper surveys and even without requisite clearance. It was further emphasised that such a process resulted in finance being spread thinly over so many projects on a continuing basis that none could be expected to take off in a reasonable time period. Accordingly, the paper pointed out the need for prioritisation of these projects and their implementation. The current budget does not even attempt to make a beginning in this direction. On the other hand, the list of new projects that have been cleared seems to be getting longer. In a matter of months, projects worth hundreds of crores of rupees have been cleared. Surely, the basis for such clearances could have been provided. This would have been in line with the present thinking that transparency is essential in planning and implementation of public schemes.

More importantly, the White Paper had stressed the need for a substantial hike in budgetary support to take care of financially unviable projects. In this context, it is perhaps useful to emphasise the role of the railways in meeting public service obligations. The social obligations in the Indian railways were estimated to be of the order of Rs 3,000 crore in 1998-99. A good part of this obligation is a result of loss on passenger traffic, which is being cross-subsidised by freight traffic. During the period 1980-1995, the cost of social burdens has ranged between 13 per cent

to 20 per cent of gross traffic receipts. The Railway Fare and Freight Committee [GOI 1993] had pointed out that if the railways was simply relieved of this social burden, they would not have to depend on budgetary support to fianance outlays. Alternatively, it was argued that the level of rail tariffs especially freight would have been lower, even after payment of dividend liabilities, if this burden was taken off the railways' shoulders. It is well recognised that the scale of public obligations imposed by the government service without any real or full compensation for the financial impact of such obligations has damaged operating revenue and reduced the investment capacity of railways. Further, the government has not behaved as a responsible shareholder and is forcing the railways to borrow from financial market at high rate of interest. According to the budget, railways would be extending market borrowings to include long-term loans with a maturity of 15 years. In 1998-99, the railways had tapped this segment for the first time to supplement borrowings through bonds. The issue that is raised here is the failure to distinguish between tasks imposed on the railways and indebtedness that is resulting from the imposition of such tasks. It is perhaps ripe for a serious consideration of the issue of providing explicit subsidies to the railways while at the same time freeing the general exchequer from provision of capital grants, which are arbitrary and are a great source of uncertainty to railway planners and policy-makers.

The proposal to create a fund for converting unmanned level crossings to manned ones is a welcome step. The status paper had mentioned the possibility of a levy on road vehicles to serve as a source for the fund. With additional levies on freight and vehicles being earmarked for the purpose of recently National Highway Development plan, such a possibility is ruled out. The budget does not make an explicit commitment but spells out the need to tap member of parliament local area development schemes budgets for these schemes. But it is necessary to target their conversions within a specified time framework and also involve state and local governments in such ventures. The absence of co-ordination at the ground level has really hindered implementation of such action plans in the past.

The important role of a local authority in managing local services especially in urban areas has been highlighted by a number of studies. Accordingly, the formation of the Mumbai Vikas Rail Corporation was greeted with great enthusiasm. However, it is understood that this organisation is merely to be involved in carrying out the implementation of the various rail projects under the Mumbai Urban Transport Plan-II (merely replacing the existing Metropolitan Transport Project). In other words, its role would not extend to operations. If this is to be the reality, the suburban commuter can only look forward to greater travel discomfort in the years to come, additional facilities under Mumbai Urban Transport Plan-II notwithstanding. Policy decisions would continue to be taken in Delhi where other priorities matter.

What is important at this stage is to properly define the role that the railways will be expected to play in the next century. However, in order to define that role clearly, it must be understood that, with the anticipated increase in traffic flows and to achieve significant reductions in traffic flows in other modes, heavy investments will be required on the railways. However, much Rail Bhavan may acknowledge this emerging need, its action plan fails to reveal such a concern.

Struggles against Sanctuaries

Debaranjan Sarangai

The state government has proposed several wildlife sanctuaries which will displace thousands of tribals who have lived in these areas for generations. This has generated a large-scale protest movement around the issue.

THE tribals in the state have experienced large-scale displacement due to industrial development as well as big dam projects. At the Similipal sanctuary project inhabitants of four villages have been protesting for over two decades and the government is yet to evacuate them. Now the government is targeting more tribals for several proposed sanctuary projects in the state. The Kotagada sanctuary situated in the tribal dominated Kandhamal district is being opposed by the resident tribals there.

Kandhamala is one of the tribal dominated districts in Orissa. Nearly 53 per cent of the people are tribals. The government of India announced its proposal to set up a sanctuary in the district spreading over three blocks of Kotagada, Tumudibandha and Daringibadi in 1981. Subsequently, notice was issued in December 1981 for hearing objections but was not served. The same procedure was repeated in 1985 when the notice was issued but not served until the Supreme Court direction came in 1996 and the administration kept people ignorant of it. But when the district administration on the same year all of a sudden banned shifting cultivation, cattle grazing and restrictions were imposed on firewood collection in the proposed sanctuary that startled the local inhabitants.

Nearly 32,000 people of these three blocks will be displaced for the proposed sanctuary. This 400 sq km project area would displace people in different phases. Firstly, the peripheral villages, then the core area villages will be evacuated. Finally, the villages coming within outer circle of the sanctuary project will be evacuated according to a district official who wishes to remain anonymous. In the north of the sanctuary lies the Mundigaarha forest block and in the south Laseri (Extension) Bhandri Srirampur forest block, in the east Simalbadi forest area, and in the west Rayagada forest area. People of the area are mainly dependent on shifting cultivation. For years tribals and other caste people like dalits who have a minuscule presence in the areas have been doing shifting cultivation in the forest. A few people have some patta land. People told me that they have been doing it for ages and they do not destroy jungles by shifting cultivation. Had it been so, there would hardly have been a jungle. Generally, they clear a patch of land which is not covered by thick forests. They do not even

cut big trees for the purpose. They cultivate a patch of land for two to three years continuously and leave it for regeneration. It is their way of forest conservation. They produce paddy, millet, black gram, green gram, red gram, turmeric, etc, through shifting cultivation and in patta land.

Besides shifting cultivation, people of the area are dependent on seasonal collection of forest produce. They collect hill broom, tamarind, honey, mahua flower, siali leaf, etc, from the forest. The market for forest produces here is not primary collector friendly. The monopoly rights of state level co-operative societies and their nexus with business people are the reasons behind the distress sale of all forest produce. Primary collectors do not get remunerative price not even the price fixed by the district price fixation committee headed by the district collector. No doubt the local tribals eke out seasonally albeit low return against hard labour.

Owing to a ban on shifting cultivation, the living conditions of a major chunk of the population of the locality has worsened. The tribals can neither go into the forest for collection of firewood nor are the collected forest produce remunerative. The state is pushing away the tribals from all possible source of livelihood. Most of the people have absolutely no source of food except for searching of roots and tubers in deep forests. Occasionally, they get some work in the government-sponsored construction activities and on the land of the few landowning people. Ban on shifting cultivation here is a well-structured plan of forceful displacement by the state.

Interference of the state in the life and livelihood of the indigenous people is opposed by them worldwide. Kondh tribals of the Kotagada range have also initiated their opposition since they heard about the proposed sanctuary. Pahadi Sangrami Mancha under which banner the struggle is being spearheaded was formed in response to the district magistrate's promulgation of the ban. people's protest gained momentum after the announcement of parliamentary election. On the eve of the election people in large numbers gather near Subarnagiri on February 14, 1998 with their traditional weapons with a promise not to cast their vote since they did not expect anything from 'welfare state'. Nearly 32 ballot boxes on the election day came to district headquarter without a ballot paper.

Though the government has restricted the entry of people into the forest and banned shifting cultivation it has leased out the bamboo forest to a private company based in Rayagada. The Mancha prevented the company from its cutting the bamboo. Recently, the Mancha has decided not to co-operate with government agencies and in this form has started opposing the developmental work at the block level. The other day the district collector came for the innauguration of a watershed project financed by the DRDA. But people of the locality gheraoed the collector and restricted his entry into the area. People also protested against the suppression of information by the administration. Finally, the collector agreed to provide a map of the sanctuary and other related information.

Time and again the government is issuing notices for public hearing. People officially came to know about the sanctuary for the first time by notice served on January 9, 1998. Subsequently, two notices have been served for public hearing on April 19 and July 10, 1998, respectively. In the last notice people have been told to bring pattas in support of their land. The Wild Animal Sanctuary Act says that those who have patta land would not be displaced. In tribal society where patta is of no use, people would hardly have pattas to prove their ownership of land. A few people have actually patta land to protecting their rights. The large number of tribals who do not have patta land would definitely be forcibly displaced. This is a ploy to divide people along the issue of patta. People in the region are not allowing revenue officials to conduct surveys to ascertain the number of patta and non-patta holders.

Besides Kotagada sanctuary another sanctuary in the new district of Gajapati has also been constituted by the government and resentment from the tribals under the banner of Lakhari Loka Surakshya Manch is in the offing. People of the Lakhari area where 15,000 tribals of 11 panchayats would be displaced are opposing the sanctuary project tooth and nail. In a congregation of tribals at Luhagudi they took a vow not to leave their land and also to oppose the entry of the local MP and MLAs in that area.

Nine more other sanctuaries are reportedly in the offing. Though chief conservator of forest (wildlife) said that no tribals would be displaced due to 'paucity of funds', notices have been issued in almost every case. There are voice of protest from other areas like Padia sanctuary in Koraput district and Athamallick in Cuttack district. The formation of an alliance of such protests is now under way to challenge state's arbitrary decision.

The debate centres on whether the tribals are responsible for either decrease in animals numbers or depletion of forest or both. Since generations tribals have been staying with animals in the forest; the state is now coming declaring areas as sanctuaries which will displace them as if they were the culprits.

Euro and Emerging Commercial Opportunities

Kalyan Raipuria

The emergence of the euro as Europe's single currency has been the most important single change in the international economy in the last some quarter of a century. Those, both countries and business organisations, who are quick to take advantage of this momentous development will be the 'winners'.

AMONG the many factors which have recently driven business around the world, market liberalisation, development of technology, notably IT, globalisation of industrial and service activities and integration of financial markets are major ones.

A wave of many players studying and operating on these factors has led, on the one hand, to a number of new management prepositions and, on the other, to several examples of proactive business participation around the world. The emergence of new IT applications, like digital, have added a new dimension to the competitive atmosphere. Competitive organisations have come up as 'winners' and have maintained or improved their market position even in the face of certain elements of 'a new global economic disorder' These include the south-east Asian financial turmoil, Russian exchange crisis, recent Latin American developments, the continuing recession in Japan, the second largest economy of the world, the large trade deficit of the US, the near 10 per cent unemployment in Europe and over-capacity in China, besides its losing public sector.

With the dawn of the euro, confined to eleven euro-zone countries, on January 1, the 'winners' will again be those who take advantage of the change over first. The alluring euro as Europe's single currency, having received a bullish reception, has been the biggest change in international finance since the abolition of fixed exchange rates 26 years ago.

The euro-zone countries have a tremendous potential for expansion of markets, particularly in services, given the size of the currency exchange market of the order of \$ 1.5 trillion per day, and bonds and stocks markets of the order of \$ 5.1 and \$ 4.3 trillion, respectively. The market capitalisation stands at \$ 1.8 trillion, while bank assets are as large as \$ 11.13 trillion. The euro-zone constitutes over 16 per cent of world merchandise trade (estimated at \$ 5.3 trillion) as the annual exports and imports of the euro-zone amounted to \$ 861 bn and \$ 760 bn, respectively, in 1997. The zone accounts for 30 per cent of world trade in commercial services (estimated at \$ 1.31 trillion), as exports and imports amounted to \$ 381.4 bn and 372.6 bn respectively in 1997. The substantial surplus in trade as well as balance of payment is indeed one of the main strengths of these countries. The zone's total foreign resources stood at \$ 290 bn at the end of 1998. The likelihood is that the euro will emerge stronger than the US dollar over a period. Thus the euro-zone, besides its large currency and stock markets, is also likely to become the magnet for capital which is what its designers aimed at.

With the euro-zone enlarged by the inclusion of the four remaining EU member countries (Denmark, Greece, Swedan and the UK) and further with the expansion of the EU, the market is likely to be very large and unique, making the world multipoler Whether the expected commercial expansion, with some mergers and acquisitions, takes place sooner or later, the euro-zone will definitely provide virtually one market of about 300 million population and GDP of \$ 16.3 trillion, the tapping of which would require very efficient and responsive financial system support. Growing IT application and increasing participation will be the mainstay for the 'winners' in the euro-zone. Countries which would be able to show proactive participation by way of invoice switching, borrowings, under different options, and financial deals, and work-out support policies will get an increased share. The role of an efficient financial system in this context cannot be overemphasised.

In case of India, the Narasimham Committee on the Financial System (1991) was prophetic in recommending liberalisation and reform of the financial sector. The transformation which has taken place in banking and non-banking finance is reflected, on the one hand, in market-based credit, interest, monetary, borrowing and exchange rate policies and, on the other hand, in higher capital adequacy on the lines of the Basle norms, improved asset quality and asset liability matching.

As the (second) Narasimham Committee on Banking Sector Reforms (1998), as also the RBI's report on *Trend and Progress of Banking, 1997-98* have brought out, the per cent of net non-performing assets (NPAs) to total advances has come down to little over 8 per cent, but need to be brought down further to 5 per cent by 2000 and to 3 per cent by 2002. The number of private and foreign banks is now nine and 42 respectively. The increased net profits of public sector banks over a short period show the possibilities of further marketisation and improvement in productivity and profits. This situation should further lead to developments like 'universal banking' and electronic transactions. According to Narasimham, the convergence of the Indian financial system with the international system can be speeded-up through risk diversification, autonomy and customer satisfaction

Narasimham has also come out with the idea of creating one-stop financial supermarkets in the country, offering an array of financial instruments through product developments (S Ranganathan Memorial Lecture, IIC, New Delhi, November 11, 1998). The world over, the focus is on the customer needs, including the needs of exporters and importers, rather than on organisations and functions. Of course, in order to avoid a crisis like in south-east Asia, the 'bubble sectors' like real estate and stock markets should be kept out, but insurance, venture capital and the like should be covered. Open foreign currency exposure needs to be restricted. Financial supermarkets, having the benefit of economies of scale, may first serve the needs of international commerce, notably trade-related as also other services. Fears of monopolistic and cartel practices need to be overcome by a proper, legal and regulatory framework, and an evolved supervisory system.

One of the national objectives of the financial system should be to efficiently support the foreign trade sector for expanding markets abroad. In the context of the euro, therefore, a proactive game-plan needs to be pursued by the financial system without waiting for 2002 when the 11 currencies of the euro-zone will be replaced terminably. Already, the EU members who are out of the zone are feeling the pressures of their trading entities apprehending erosion of competitiveness.

The dawn of the euro has meant not only the emergence of a new single currency, but has also thrown open several opportunities and challenges in respect of financial services and 'virtualisation' of business entities around global brands, both made possible by availability of low-cost, high-bandwidth technologies for communication, and the IT system. Indian business should meet some of the requirements of the emerging markets due to outsourcing by the euro-zone so that foreign exchange earnings and profits can be increased at a significant rate. A wait-and-see approach may be prudent in respect of risk activi-

ties, but is otherwise likely to prove a cause of loss of opportunities. Indian exporters and the financial service players would gain by aligning themselves with the euro as early as possible.

The inter-bank euro-denominated deals struck by the Bank of America (for L & T and IPCL) and ABN Amro with the SBI, on the eve of the euro-launch were examples of proactive business, though more of as signals than real attempts to capitalise on the opportunities.

The RBI Working Group on the euro (October 1998) has brought out the issues and the implications which can help a proactive game-plan, including its recommendations regarding media, publicity, public initiative, customer education, HRD and training in the financial system Among other things, according to the working group, switching to the euro would mean an investment, including of time and financial and human resources by the companies, besides review of trade promotion, new business as well as new strategies and new contracts in the new context. Small and medium enterprises need to find new ways to organise their individual efforts to be viable and match the big boys.

As euro-zone plans for harmonisation of taxes and duties progress, there will not only be increased product and price transparency all round but also efficiency and stability in transaction costs, such as reduced or no banking fees for conversion of euro currencies. With the observed and projected low inflation (below 2 per cent), price stability will be the hallmark of the euro-zone, while low interest rates would enable expanded trade finance and capital transactions at low cost.

Certain guidelines have been issued by the International Chambers of Commerce to be useful during the transition period, which should be used for expedient preparation, including of business strategies, with the objective of early chipping-in.

Business organisations would be well advised to take a longer-term view to be able to meet the real challenges of business expansion. Strategies should include choice of right business locations, a review of critical parameters like production and infrastructure cost, as multiple locations for business may not be necessary. New ways to differentiate products will have to be found to overcome the absence of price variations across the euro-zone expressed in the single currency.

Fear of an increasingly closed euro-zone market, earlier seen in terms of 'Fortress Europe', may again prove irrelevant and self-defeating.

It is not enough to say that the business community and the banking system are ready to get into the exchange system of euro and expand the level of reserves as currency strengthens. If Indian business can be proactive in terms of taking a view of emerging business in goods as well as services at the earliest, aiming to expand foreign exchange earnings and to increase profits, the EU would be a source of strength for business in other markets.

Lessons for regional co-operation from EU and euro are clear as a 'role model'. A long-term approach to form customs union, community, and then a free currency area, beyond a free trade area, in south Asia as a whole needs to be actively discussed. The issue of Asian Currency Union (ACU) and an Asian currency (say, an asio) was put by the Philippines' president on the agenda of the recent ASEAN summit in Hanoi and found its way into the six-year Action Plan. This is considered a long-term possibility, given the strong regional linkages.

[Based on the author's key-note address to a colloquium organised by FIEO in New Delhi on January 22, 1999 The views expressed are personal]

US Policy on Iraq

Latter Day Gunboat Diplomacy

Harold A Gould

The failure of America's Iraq policy vividly illustrates the limitations of gunboat diplomacy.

IF the numerous attacks launched by the United States and its various assortment of allies against Iraq have proved nothing else, it is that so-called 'smart bombs' are really not all that smart. The misfire in Basra that killed many innocent civilians punctuates this fact. As do the persistent and essentially fruitless attacks now being conducted against Iraqi air defence systems. Repeatedly, the claims that have been made for these robotic instruments of surgical destruction have turned out to be vastly exaggerated. As has the political payoff supposedly accruing from their use. Saddam Hussein has merely rolled with their punches, dusted himself off, and resumed his dogged attempts to rebuild his military machine. There is a good reason for this sombre result. Gunboat diplomacy is passe. It did not work all that well in its original incarnation, viz, during the colonial era when it took the form of armed shallow-draft boats plying the Yangtze river taking pot-shots at war lords and remnants of the Ch'ing dynasty who got in the way of economic pillage by western imperialists. Its current manifestation, carrier task forces plying the Red Sea and Indian Ocean launching bombers, fighters and cruise missiles against recalcitrant west Asian states in an attempt to bend them to the will of the world's only superpower, does not do it either. In Iraq's case, its main accomplishment has been to enable Saddam Hussein to bolster his authoritarian grip on his people and heroise him in the eyes of radical Arab nationalists.

It is not that military means are never an acceptable aspect of foreign policy. Everybody knows that there are times when the use of force is unavoidable, as clearly it was in the second world war when the Axis powers posed a pervasive threat to the survival of liberal institutions throughout the world. As it was when Chinese troops poured across the Indian border in 1962 and threatened to destroy its national self-respect. The problem arises when the world's last superpower resorts to the use of force as a bullying tactic, as a substitute for an enlightened foreign policy, or as a means of covering up for the failure of a bad one. Informed strategic thinking, by contrast with gunboat diplomacy, sees military action as only the last resort when all measures short of war have been exhausted.

The failure of America's Iraq policy vividly illustrates this distinction. In 1991, Operation Desert Storm at least had the virtue of enjoying wide consensus in both the West Asia and the world community. Only Jordan among immediately contiguous Arab states refused to join the UN mandated coalition which the US led against Saddam Hussein. Turkey joined it as well, and so in varying degrees did many European states.

However, the aftermath of military victory revealed that even in these favourable circumstances there was little understanding of why the battle was fought in the first place, and even less understanding of what must follow politically in order to consolidate the fruits of victory. In the words of *Washington Post* correspondent Jonathan Randall, "Rarely in the history of human conflict had so great a power mobilised so many allies, moved so many troops and so much *materiel*, yet remained so purposely incurious about the nature of the enemy's society..."

The tragic flaw in the 1991 UN operation which consigned it to the status of gunboat diplomacy was the failure to go the extra mile and make sure that Saddam was either removed from power or at minimum politically neutralised within Iraq. This would have required no more than one more day of allied military action followed by a clear and comprehensive policy of breaking the Saddam faction's stranglehold on the Baath party, encouraging some degree of political separatism for both the Mosul Kurds and the Basra Shiites, and encouraging improved human rights for all Iraqi citizens. Instead, the US, as leader of the coalition, decided it must appease its Turkish ally by downplaying the political aspirations of the Kurds, placate its Saudi ally's (and its own) phobias about Iranian fundamentalism by inhibiting the political aspirations of the ethnically distinct Iraqi Shiites, and, in the name of 'regional stability', limit its own post-war initiatives to encouraging a military coup. Even if successful, the latter would have done nothing more than replace Saddam with another Iraqi general who would have employed the Baath party apparatus to perpetuate the Sunni-dominated Iraqi ruling class's power monopoly, which has been the country's bane for decades.

The best chance for a way out of its policy dilemma toward Iraq is for the US to formulate policies that do justice to the history and culture of the region instead of trying to shoot its way out of its self-created policy paralysis. This means initiating measures which in the long run offer some hope of modifying the Iraqi regime. First and foremost, the economic sanctions must end. Their principal effect has been to pauperise the Iraqi people and make them more dependant on the whims of the Saddam dictatorship than ever. Second, all possible means should be employed to pluralise Iraqi politics This requires actively encouraging a sufficient measure of political autonomy for the Kurds and Arab Shiites to enable them to parry Saddam's and the Baath party's autocratic predilections. Third, the Clinton administration needs to follow through on its recent pledge to support opposition groups both within and outside the country. The Iraq National Congress is one such formation but not the only one. There are indigenous nodes of opposition among both the Kurds and the Shiites that can be encouraged and actively supported. The goal should be a crystallising coalition of dissidents whose empowerment would permit the Iraqi people to reform themselves from within, according to their own light. US power could then concentrate on what a superpower should be concentrating on: The broad parameters of international peace and security rather than trigger-happy exercises in outmoded gunboat diplomacy.

Welfare Implications of Telecom Tariff Reform

Pinaki Das
P V Srinivasan

The suggestions made by the Telecom Regulatory Authority of India to reduce the price of international and long distance calls and raise telephone rentals and local call charges are eminently justified on efficiency grounds. Nor are the equity implications of the changes necessarily adverse.

THE Telecom Regulatory Authority of India (TRAI) recently made suggestions to reduce the price of international and long distance calls and increase that of local calls and telephone rentals. The debate that has followed this suggestion is mainly concentrated on addressing the question whether elimination of subsidies is desirable on grounds of equity. The possible adverse implications of the proposed reform on the achievement of the social goal of universal telephone service has also been a matter of concern. Another criticism of the TRAI recommendation has been that it has been based on Australian price elasticities which may not be relevant for India [Vyasulu 1998]. In this paper we address each of these issues in detail. We argue that the suggestions made by the TRAI are well justified on efficiency grounds. Moreover, the equity implications of the recommended price changes need not necessarily be adverse. Subsidising telephone rentals and local call rates is not the best way to achieve greater penetration. The efficiency costs involved in this are too great to be ignored. Other cheaper methods such as targeted subsidies need to be explored. Bringing down long distance prices is also welcome since it would pre-empt inefficient entry when the long distance sector is opened up to competition.

Estimate of own price elasticity of long distance calls for India based on public call office (PCO) data turns out to be very high. The elasticity is high enough to bring about an increase in producer surplus through a reduction in price rather than an increase. This means that consumer as well as producer welfare can be improved through a reduction in long distance rates alone without having to increase the local call rates. Since price elasticity is very high, marginal social cost of raising funds from taxing long distance service will also be high compared to taxation of other goods. This means that funds for achieving social goals such as telephone coverage in rural areas should be obtained from outside the telecommunications sector where the social costs would be lower.

Universal Service: A Demand Side Problem

The concept of universal service has played a role in regulatory decision process even in developed countries such as the US. Several interpretations have been given to the objective of provision of universal services. During the initial stages of development of telecom industry this concept pertained to geographic scope of the network. That is, telephone service should be available in all areas of the country and within easy reach. A more recent interpretation of this concept of universal service is that, local residential service should be made widely affordable by keeping the telephone rates as low as practically possible. Another way of looking at this concept is that access to telephone services should be available to all regardless of their ability to pay. This is the idea behind the provision of public telephones. Yet another argument is based on economic considerations. Because of the network externalities that get generated, there is a need to promote increased subscription to the telecommunication network. Benefits from access accrue not only to the subscriber added to the network but also to all those existing subscribers who can potentially reach him/her.

The objective of universal service, in the sense of affordability, has been pursued through pricing policies designed to maintain low rural rentals and local call rates. Prices were even held below marginal costs through a cross-subsidy from long distance calls. The disadvantages of such a system are many. First of all it involves costs in terms of efficiency losses. Since prices are different from marginal costs of provision of the service it distorts consumption decisions. It is also inequitable because all local users pay the same low rate irrespective of their ability to pay as reflected by their incomes. Targeted subsidies are more efficient.

Finally, and most importantly, subsidisation of local rates and rental charges may not really serve the objective of universal service. Theoretical and empirical studies of demand for access have shown that the decision to connect to the service is extremely insensitive to price of access and relatively much more sensitive to income levels [e g, Taylor 1994 and Hausman 1997]. TRAI recommendations for tariff changes are based on the assumption that local calls are currently being priced below their marginal costs of production, and that long distance calls are priced above their marginal costs. In fact, this kind of cross-subsidies would only imply that inefficiency in local exchange service is being encouraged in the garb of promoting universal service. If the local services are open to competition the costs are likely to decline significantly and the need to subsidise local rates will decline. Also if price is held above cost for cross-subsidy purpose, as in the case of long distance calls, it can attract inefficient entry. Consumer interests will be best served through adoption of economically efficient pricing, encouragement of competition and reforming the system of providing universal service.

A major problem faced in the provision of universal service is in terms of geographical coverage. Covering distant rural areas with low subscriber density involves high costs. So far, it appears that the DoT has only been tackling the supply side of the problem, and the emphasis has been on finding technological solutions to covering widely spread areas with a low subscriber density. The usage, or demand side of the problem has by and large been ignored; it was assumed that supply will create demand. Of the 0.6 million villages in the country about 0.33 million have telephones. Of these about 5 per cent of the villages have rural exchanges and the rest have just village public telephones (VPTs) connected to the nearest rural or urban exchange. This remarkable coverage has actually been achieved in the last three to four years during which period more than 50 per cent of the villages have been covered. Considering the size of the country and the scattered nature of its villages this is no mean achievement. But there is a lot

that these impressive numbers hide. How many of these VPTs actually work? How many are in use? Survey of villages in Kutch district, Gujarat, revealed that more than 60 per cent of the multi access radio relay (MARR) VPTs were faulty. Of the remaining, a high percentage were disconnected due to non-payment of dues, so that in effect, very few are in actual use [Das 1998]. Provision of access does not ensure its use. Several social and economic factors intervene, creating a situation where, on the one hand, we find the state allocating funds with great difficulty to provide access to remote villages and, on the other hand, the VPT goes out of use within months of its installation Such a paradoxical situation undermines the very concept of universal service coverage.

What could be the reasons for this evident lack of maintenance and frequent disconnections? Inappropriate location of the VPT, inability to pay for the service, inadequate awareness regarding the uses of telephone and lack of incentives for the person in charge of maintenance of VPT, appear to be the major problems. Ideally the telephone should be located in a place where it can be accessed by all sections of society, for the longest possible duration, and someone should be nearby to collect the money and to receive messages Since 1991, the VPTs have been installed mostly at the panchayat premises The sarpanch is susceptible to 'popular' pressures from villagers who take it as a benefit provided free by the government In some cases the sarpanch pay the entire VPT bill out of his/her own pocket or allocates a part of the funds at his/her disposal for this purpose. However, this is not true in general and the telephone gets disconnected due to non-payment of arrears, after being in use for a few months.

It is only in recent times that the department is allowing VPTs to be installed in village shops – usually a grocery store. Earlier most of the VPTs were installed in the village post office; consequently people had to pay for the calls. The post office is under no obligation to provide 'free' service, and calls get paid for; so is the case with the local grocer. Other possible sites for location are the village school, or the temple/mosque/gurdwara. From the point of view of maintenance it becomes very important that there exist a person or group in the village who will directly benefit from its use and hence be motivated to ensure continuity of service. Even where VPTs are in working condition, the revenue generated is low; one reason for the low volume of calling is the lack of STD facility in most rural areas. The government plans to provide a telephone in every village by the year 2000 and expects the private operators to share this responsibility. But as the network reaches out to more and more remote areas the potential for generating calls is likely to diminish In the short run, therefore, franchising VPTs cannot be a solution as it works on usage volumes.

Finally, telephone does not seem to touch the lives of the rural poor; only a few who are in need of day-to-day communication can hope to benefit by its use. Universal service, even if it were achieved will not really mean much to a vast majority of rural India, unless provision of telecom service in the villages is integrated with a much wider programme of dissemination of information and knowledge that fundamentally reorient rural living The rural sector lags behind in telephone usage and adopting of other new information technologies mainly because of economic barriers as well as low educational levels.

To conclude, at present achievement of universal service requires more of tackling the demand problem rather than the supply problem, though both are of equal importance Unless the problems discussed above are adequately solved, universal service will continue to remain a myth, even if the supply side of the problem is taken care of.

Price Elasticity of Demand: Implications for Tariff Reform

In its proposals for telecom pricing the TRAI had to base its calculations on elasticities obtained for Australia [Government of India 1998]. The major reason for this is the lack of appropriate data suitable for estimating demand relations. For example, it is difficult to obtain a break-up of telephone usage between residential and business customers or between local and long distance calls. As long as the DoT was the sole provider of this service, it had devoted its entire effort to managing/containing the backlog of supply and as a consequence the data that were generated in that process were predominantly in terms of penetration rates and waitlists. The thrust for data hunting coincides with the opening of the sector to private investment and it is unfortunate that most of the data that are being generated now are proprietary in nature – data that may never enter the domain of public debate. Even in developed countries, since 1980s, because of the increased competition data have become proprietary in nature making the access to data increasingly difficult. Yet the important issues that concern the investor,

Table 1 Price Elasticity of Demand for Long Distance Calls

Explanatory Variables	Public Call Offices (1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

Note The regression results using data from each of the eight public call offices are given separately The dependent variable is duration (seconds) of calls made per day (acd) in each time and distance zone during a two-month period Number of observations is 18 since there are 6 distance zones and 3 time slots A semi-log functional specification is used [log(acd) = B0 + B1(price) B2(Ddz1) + + B5(Ddz5)+ B6 (Dtz1) + B7(Dtz2)] Price is measured in rupees per minute of call duration Ddz1-Ddz5 are dummy variables indicating the distance zone in which the call is made 1 denotes the shortest and 6 the longest distance zone. Similarly, Dtz1 and Dtz2 are dummy variables indicating the time slot in which the call is made. 1 denotes the peak period (8 00 AM to 7 00 PM) and 2 and 3 denote off-peak periods Dtz1 takes the value 1 if the call is made in time zone 1 Dtz2 takes the value 1 if the call is made in time zone 2 (6 00 AM to 8.00 AM and 7 00 PM to 9 00 PM) For each of the distance zones, prices in the time slots 1,2 and 3 are in the proportions 4 2 1

as well as the consumer at large, like those relating to the question of cross-subsidisation and tariff rebalancing can hardly be resolved without an idea of the relevant cost and demand parameters.

In a study on telephone usage demand for India, Das and Srinivasan (1998) make use of PCO data to estimate price elasticities of long distance calls. The data source for this study is the printout of detailed bills for eight STD PCOs of Tiruverambur (near Trichy) for the billing period November 1993 to January 1994. This data set contains information on each call made during the two months for each of the PCOs; the duration of the call, destination called and the time of the day when the call was made. Unlike in the household or personal level data, in the PCO data the caller identity is unknown. It is therefore impossible to identify residential and business demand parameters separately. It is also not possible to analyse the effect of socio-economic variables on the call behaviour. However, the information is sufficient to estimate the own price elasticity of demand for long distance calls. Tiruverambur being a small town, the PCO data is likely to represent only the low end users such as the small businesses, households, the travelling public and customers from the surrounding areas without access to telephones. The demand patterns observed therefore need not necessarily represent the general consumer behaviour. At the same time if one considers the fact that PCO traffic constitutes a sizeable portion of the national traffic the estimates can be taken with a greater confidence.

Although telephone tariffs are fixed for the period for which the PCO data have been considered the price per minute of call varies with the time of the day and day of the week, when the call is made and the distance zone to which it is made. In order to get adequate price variation it is assumed that there is no price induced substitution between calls made to different distance zones. If this assumption is not made, then one has to estimate call demand for each of the distance zones as a function of own price and the prices of calls to all other distance zones (substitute prices). In such a case, one is left with very little variation in prices, price per minute of call in each of the distance zones taking only three possible values corresponding to the three time slots in a day. This assumption, however, is a very reasonable one. Hardly anyone would substitute a call to a person in one distance zone by a call to a different person in a different distance zone simply because the latter is cheaper. One could of course, expect the length of a call (or number of calls) made to a person in a high price distance zone to be lower as compared to calls made to low price distance zone. Or, the longer the duration of a call is likely to be the higher are the chances that it is made in off-peak hours where the price applicable is lower. Although the relative prices of calls made in the three different time slots are the same across different distance zones, it can still be expected that the frequency with which calls are made in different time slots varies with distance zones. This gives us an opportunity to estimate price sensitivity of demand for calls even though the tariff structure is fixed for the data period. In all the PCOs considered it is noticed that for the largest distance zone the number of calls made in the off-peak period are higher than in the peak period. This is because the longer the distance, the higher is the price of a call per minute and hence higher is the benefit of substituting a peak hour call for an off-peak hour call. Thus, given the data on the length of calls made and the time and day at which they are made, one can obtain the price elasticity of calling time.

The estimates of own price elasticity have been obtained by using a semi-log functional form. Demand, which is measured as the average call duration per day, is expressed as an exponential function of price (rupees per minute of call) and other exogenous variables such as dummy variables for time and distance zones. This specification implies that the price elasticity of demand is proportional to price and therefore allows the estimation of elasticity for different price categories. The price coefficient obtained from the regression equations for the different PCOs varies from –0.07 to –0.19 (Table 1). Since the regression equation is of semi-log functional form the price elasticity is obtained as the price coefficient times price. Thus, for the lowest price category (rupees 1.64 per minute of call time) the elasticity estimate ranges from –0.11 (–0.07×1.64) to –0.31 (–0.19×1.64) and for the highest price category (rupees 39.30 per minute of call time) it varies from –2.75 to –7.47. For the middle level price category (rupees 19.65 per minute of call time) it varies from –1.37 to –3.70.

The price elasticity of demand for calls in the least price category can be assumed to approximate the price elasticity of local calls. The own price elasticity of demand for the long distance calls is approximated by the estimate corresponding to the intermediate price category. The elasticity values in the case of local calls are comparable to those obtained for developed countries. However, the values for long distance calls are much higher than those obtained for these countries (Table 2).

One major implication of the very high own price elasticity of long distance calls is that welfare gain (increase in both consumer and producer surplus) is possible through a decrease in the price of long distance calls alone without touching the other prices [Das and Srinivasan 1998]. This will hold so long as the price charged is in excess of marginal cost of production (or, equivalently marginal cost to price ratio is less than unity). In fact, welfare gain can be achieved by decreasing prices of all the three items: long distance, local and rentals. A decrease in all three prices leads to increase in consumer surpluses from the consumption of these items. When the own price elasticity of long distance demand is high, a price decrease results in an increase in producer surplus also. This result however, depends on the value chosen for the price-cost mark-up. For the given own price elasticity (–3.7) this result will hold only when the ratio of marginal cost to price is below 0.7. The results presented here have been obtained by

TABLE 2: OWN PRICE ELASTICITIES FOR INDIA AND OTHER COUNTRIES

Country	Year of Study	Local Calls		Long Distance Calls	
		Short-run	Long-run	Short-run	Long-run
USA	1973	–.21	–.27	–.88	–1.03
Canada	1972	–.20	–.70	–.11	–2.57
Sweden	1974	–.27	–.38	–	–
Great Britain	1974	–	–	–.72	–1.12
Australia	1997	–.04 to –.38	–	–.21 to –1.55	–
India	Current	–.11 to –.31	–	–1.37 to –3.7	–

Note: (–) indicates estimates not available. The estimates for countries other than India and Australia are all obtained using time series data with price deflated revenue as the dependent variable and relate to combined residential and business demand [source, Taylor 1994]. The estimates for Australia are as quoted in Government of India (1998). The estimates for India are obtained using PCO data where the dependent variable is the duration of call made. The own price elasticity of local calls is approximated by the elasticity of the average call duration per day of calls made in the least price category (Rs 1.64 per minute of call time). For long distance calls, the price elasticity is approximated by that obtained for duration of long distance calls in the middle level price category (Rs 19.65 per minute of call time).

assuming a value of 0.6 for this ratio. For the both the local calls and telephone rentals this ratio is assumed to take the value 1:4. The increase in consumer surpluses, along with the rise in producer surplus in the case of long distance calls, outweighs the loss in producer surplus arising from a reduction in local call tariff and rental charges. Thus, if the demand for long distance calls is indeed highly price elastic as is evident from PCO data and the price-cost mark-up is close to the value assumed, the proposed reform will lead to a welfare improvement. The TRAI could in fact afford to decrease long distance prices alone or even decrease all three prices and make it widely acceptable to the public. The fact that decreasing prices of all the three items: local, long distance rates and telephone rental can increase welfare gain indicates that the current structure of cross-subsidy is itself inefficient. One could have subsidised local calls further by choosing to charge a lower price on long distance calls! But beyond a certain point further reduction in long distance rates would start resulting in a loss of producer surplus. This is because the result depends on both the magnitudes of own price elasticity as well as the price-cost mark-up. For a given price elasticity as the price-cost mark-up approaches zero, a price fall is more likely to result in loss of producer surplus. Thus at some point of time if long distance rates are to be reduced without affecting producer surplus, the other rates have to be increased thereby reducing cross-subsidies. This brings us to the issue of equity implications of such a move.

Equity Implications of Proposed Price Changes

It has been argued by some that the recent proposals of TRAI are undesirable from equity point of view. The decrease in rates on long distance and international calls is being interpreted as benefit accruing to the rich and the increase in the price of local calls as a loss to the poor. While it may be true that low volume users are mostly local call users, it is not necessary that all of them are poor. So there is really no justification for providing subsidy uniformly to everyone. Targeting subsidies to particular user groups – low income and other deserving groups such as rural VPT users, elderly and widows – would be a better way. Although, the high volume users are predominantly long distance callers, they may be making equally large number of local calls. Long distance calls as a proportion of total calls need not necessarily be high for them. In other words many of them would be using both the services and removal of cross-subsidy need not imply a net transfer of benefits to them.

One might argue that a better way of achieving equity is through cross-subsidisation of the residential by the commercial users. However, it may not be easy to make a distinction between the two groups. Even if such a distinction is possible in practice the firm might be passing on the increases in the cost of inputs to the final products' price. In such a case the incidence on the final consumer is not obvious. In any case the purpose of equity is already being served by the inverted block tariff structure currently in place, where in the high volume consumers face a higher marginal price compared to the lower volume ones.

Concluding Remarks

The main purpose, as laid out in the National Telecom Policy [NTP 1994] of allowing private participation in the telecom sector was to bring in funds for network expansion. It was also expected to bring in better service and infusion of state of the art technology that would follow naturally from competition (guided by a regulator) and involvement of international players. The process of selection of licensees had two main ingredients/criteria; (1) licence fees and (2) network roll-out and village coverage. The high licence fees pledged during the bidding process are apparently the biggest threat to the profitability of the present basic licensees. It is perhaps no coincidence that, short of scrapping these fees altogether, the tariff revisions as suggested by TRAI, could go a long way in making these held up investments viable. It would also enable the entrant operator fulfil its VPT obligations better. On its part, the TRAI, in authoring the tariff rebalancing that ensures viability of private investment, needs to be equally vigilant about compliance to network roll-out and village coverage promised by the licensees; this would be in keeping with the objectives of NTP 1994. Thus, the rationale of the TRAI recommendations is very clear: to bring tariffs in line with costs; thereby prevent inefficient entry in the long distance sector (which is to be opened up for competition) and also to encourage efficient and low cost technologies in the local loop competition. The main opposition to these recommendations has been on equity grounds as well as the possible adverse implications for the social goal of universal service provision. We have argued in this note that the fears expressed on these counts are not reasonable.

The emphasis on universal coverage stems from the realisation of the link between telecommunications and development. But in practice, this link remains largely confined to the urban-manufacturing society. To carry it over to the rural sector presents the most important challenge to the government. Trials or demonstrations of the use of different services and promoting the use of telecommunications and diffusing of new technologies should be part of the government's strategy for achieving universal access. There are areas that offer new economies of scale. For example, telecommunication network can help small businesses reach out to a sufficient number of customers to form a viable market. Another example is a public service such as distance learning or adult literacy through the internet. Courses can be initiated from anywhere, as long as a school is in the network. If a number of spatially separated schools can join in use of a course then there can be a sufficient economy of scale to offer it. Other applications are possible in the areas of rural health care and law enforcement where telecommunications can help in better co-ordination of delivery and administration of these services. Dissemination of information in areas like micro/macro weather forecasting, and along irrigation canal systems can also be useful avenues where telecommunication can be helpful in much broader spheres of rural activity. Only when telecommunication comes embodied in technologies/practices that are of direct relevance to the rural poor, will universal service truly become relevant in the rural areas.

[We are grateful to Deepanwita Chattopadhyay and Shikha Jha for helpful comments.]

Men nearly always follow the tracks made by others and proceed in their affairs by imitation.
– Nicollo Machiavelli, *The Prince* (1514).

THIS book is an expanded version of the author's Ohlin Memorial Lectures delivered at the Stockholm School of Economics in 1995. It is an extraordinary piece of work; it opens up a wide window through which the reader can see across continents, centuries, and civilisations. The subtitle gives away the vastness of its scope and much more, while the title makes you hold your breath in suspense.

The architecture is superb. The society, Lal visualises, has a number of different processes with their respective equilibria that could explain social outcomes. They can be distinguished by the period of time over which the equilibrating forces work. The quickest working is the commodity process of supply and demand, which leads to a market equilibrium. The second fastest are the processes leading to an equilibrium regarding material beliefs – beliefs which are related to ways of making a living, that anthropologists and archaeologists call the material forms of a culture. These processes shape the organisational framework within which the market operates. Changing signals from the environment can alter such material equilibria within the life time of one generation. Third, next slower moving are the cultural equilibria associated with another set of beliefs – known as cosmological beliefs – those related to understanding the world around us and the humankind's place in it which determine how people view their lives – its purpose, meaning, and relationship to others. These would seem to require at least a generation or two to alter. Finally, there is the darwinian evolutionary equilibrium associated with the 'selfish gene' which we have inherited from our thoroughly selfish ancestors who roamed for millennia in bands of hunter-gatherers. Evolutionary psychologists say that given the time frame of darwinian processes of 'inclusive fitness' – it takes about 10 thousand years to produce a new species – much of our current biological nature must have been formed in the distant past, in particular during the hunter-gatherer phase of our development. It is unlikely that natural selection has since markedly changed those instincts. The evolutionary equilibrium is thus the slowest-moving of all. We can ignore it in this investigation, except for its legacy in our mind.

In the perspective of historical long run, as Braudel has so eloquently shown, "mountains, not monarchs...come first". That is to say, relative factor endowments – of land, labour and capital – remain the most basic building block to explain many surprising outcomes in the spheres of culture, economics and politics. They are the DNA of the story Lal tells. But he is not committed to either crude geographical or historical determinism. Lal looks "at parts of world history through a very, very wide lens!".

The early stirrings of civilisation took place about 10 thousand years ago with the invention of agriculture in the hills of nothern Iraq or Kurdistan where wild wheat and barley were abundant as nature's gift. In course of time ancient civilisations arose in the river valleys of the Tigris and Euphrates, the Nile, the Indus, and the Yellow. These civilisations were based on fairly intensive cultivation with annual cropping nursed by irrigation. The regions in the north and in the south of these abodes of agrarian civilisations had different ecological conditions, not favourable for intensive cultivation. They became nomadic pastoralists, the north herding cattle and horse in grasslands, the south rearing sheep and goats in semidesert. These pastoralists of the north and south, as much as the settled agricultural civilisations on which they preyed, were an essential part of the dynamics that has created the modern world.

As the subtitle of the book goes, next comes culture, to which belong material as well as cosmological beliefs. The material base produces the philosophy and the means of living.[1] The rich Nile valley lies isolated and protected between empty deserts on either side. Egypt derived its prosperity from annual inundation of the Nile, which never fails to rise, even if floods differ greatly in effectiveness. By contrast, Mesopotamia lacks clear boundaries and was periodically looted by the mountaineers on its east or the nomads on its west. For much of its grazing it depended on uncertain rainfall and on the banks of its river Tigris which was most unaccountable, turbulent, and dangerous. Both societies, Egypt and Mesopotamia, reflected the natural rhythms of the season in their festivals. But whereas in Mesopotamia they were imbued with a sense of anxiety, with the solemnities moving from deep gloom to exultation, in Egypt they merely reaffirmed that all was well with the world. The Egyptians, the ever optimists, had a static view of the universe, believing that the cosmic order had been established at its creation. Denying the reality of death, they considered life to be everlasting:humans survived even though the body decayed.

If ecological differences account for these different cosmologies of the two ancient religions, they can also explain that of the third major near eastern religion which has had even longer life and has changed the world – Judaism. The nomadic people had a third form of kingship which differed from that of the ancient Egyptians and Mesopotamians. This type of polity is found among people who acknowledged kinship above every other bond of loyalty and whose coherence derived from a shared nomadic past than from what they had achieved as a settled community.

The Hebrew cosmological beliefs, Lal narrates, were formed in a kingless period. Their god was a transcendent god who had primacy over any other earthly powers. And the tribes accepted a king only under exigency to "go before us and fight our battles" against alien oppression. Thus where kingship was a function of the gods in Egypt and a divinely ordained political order in Mesopotamia, for the Jews it was an institution set up to deal with an emergency. Thus, unlike the kings of the Egyptians and the Mesopotamians, the Hebrew king lacked sanctity. "The relationship with his people was as nearly as secular as is possible in a religious society. Nowhere else in the near east do we find this dissociation of a people from its leader in relation to the divine."

Our hunter-gatherer ancestors have bequeathed us rugged, egotistical indi-

vidualism. Meanwhile, human nature has acquired another trait – 'brotherly love' – from culturally transmitted cosmological beliefs. The latter is often labelled 'collectivism'; but Lal prefers the term 'communalism' instead. However, communalism has a very different meaning in India. So I shall refer to it as 'fraternalism'.[2] Ever since the rise of the great Eurasian civilisations both individualism and fraternalism have been ingrained in man's character. Some social psychologists have attempted a quantification of these attributes across different cultures. One important finding is that the west is more individualist than the rest. In this respect the west appears to be closer to the hunter-gatherer societies than to agrarian civilisations which were primarily fraternalistic. But, inasmuch as the west, too, was initially a part of the ancient agrarian Eurassian civilisations, its current exceptionalism needs some explanation. Why and how this changeover took place and with what consequence is a central theme of this book. And on it hangs an interesting tale.

Individualism may be defined as "the view that the society is constituted of autonomous, equal units, namely, separate individuals and that such individuals are more important, ultimately, than any larger constituent group. It is reflected in the concept of individual property, in the political and legal liberty of the individual, in the idea of the individual's direct communication with God." English local records, legal textbooks, and autobiographical documents show that since the 13th century England has been a country where the individual has been more important than the group. The present English family system is much the same as it was in 1250 AD and is not the result of the industrial revolution of the 18th and 19th centuries. There is little doubt that by the 13th century individualism was in place in at least a part of western Europe.

But its origin goes back to papal decisions in the sixth and 11th centuries. The two revolutions of Pope Gregory I on the family, and of Pope Gregory VII in the creation of modern legal institutions, have had lasting effects on the west, besides being the crucible for its key cosmological belief – individualism. In response to queries raised by Augustine, the first Archbishop of Canterbury, in year 597 Pope Gregory I forbade four popular habits: marriage to close kin, marriage to close affines or the widows of close kin, the transfer of children by adoption, and finally, concubinage, a form of secondary union. Gregory thus overturned the traditional Mediterranean and West Asian patterns of legal and customary practices in the domestic domain. These papal injunctions inhibited a family from retaining its property and promoted its alienation. This is, of course, what the church wanted, for, from its inception, it had grown and become a rich landlord through gifts and donations. Hereafter, the church's accumulation knew no bound.

In year 1075 Pope Gregory VII declared the political and legal supremacy of the papacy over the entire church and the independence of the clergy from secular control. Gregory also asserted the ultimate supremacy of the Pope in secular matters, including the authority to depose emperors and kings. About this time the moment of self-generating economic expansion came to western Europe. There was no single outstanding technological innovation behind this expansive movement, but a combination of many circumstances: growing accumulation of capital, rising population, the return of the Mediterranean to western control, the political decline of the Greek and Moslem empires, all helped to open up everenlarging propsects of the west. The papal revolution provided the institutional infrastructure for this western economic dynamic. The most important for the economy was the development of the law of the merchant in which various rights and obligations associated with commercial relations came, under the aegis of the church, to be consciously interpreted as constituent parts of the whole body of law.

For the west that marked the turning point. Between the sixth and 11th centuries thus Popes Gregory I and Gregory VII paved the way for the primitive individualism to rise from the slumber lulled as it was by the cultured human propensity of fraternalism (a k a 'collectivism' and 'communalism') which in turn had grown in the agrarian civilisations of Eurasia. The 18th century enlightenment further invigorated individualism. In the following two centuries individualism had wreaked havoc in the west by disrupting family life, prompting crime, violence and drugs. For the modern world it is of immense significance.

In Lal's perception of history, let us recall, the starting point is geography from which flow philosophy, polity, and finally the economy. What I find missing from all this is the reverse flow: the feedback from economics to politics, philosophy, and even geography, and the simultaneous evolution of all of them together, however, non-synchronous. Of course, 'that is Mount Everest' is a brute fact as Lal insists; but our knowledge about the mound of earth is not a fixed, known datum. To be sure, land can be upgraded, labour can be improved, and capital can be accumulated by the free will of the people. Factor endowments are not altogether exogenous. To be more specific, I do not find 'man' as a self-conscious 'rational animal'[3] playing a role anywhere in Lal's description. He or she is shown always dictated by mountains, rivers, deserts, Pope, priest, or prophet. He or she always toils hard to deliver surplus to the parasitic elites. And those elites, in turn act like robots that somehow make the primary producers behave. Even those elites do not decide, they do not choose, so they are as good as dead. I shall illustrate this point further with reference to Lal's attempt to rationalise the Hindu caste system as a mechanism for resource allocation. I shall argue that our ancestor aryans had as many as five options to address the fundamental problem of survival. Lal nowhere proves that the caste system was for them the best solution. He takes the caste system as given, and then proceeds to rationalise it.

About three thousand years ago pastoral aryans entered India. In those days they themselves were divided into three broad classes (not yet castes, mind you), viz, the brahmanas (priests), the kshatriyas (warriors and aristocracy), and the vaishyas (common people). Advancing through the Gangetic plain they defeated the "darker, snub-nosed, indigenous non-aryan peoples", and treated them as 'dasas', almost equivalent to slave, but not quite. Now the 'varna' the colour of the skin, comes to the forefront: the aryans are fairer, the other darker. The dasas were offered a place at the fringe of the society under the category of shudras. With this addition the outlines of four-class varnas became rigid. Whilst the four varnas provided the broad conceptual framework for the evolving Hindu society, in practice the social system consists of numerous occupation-specific subcastes or 'jatis', all ordered in rank. The interweaving of these micro subcastes is the real fabric of the fragmented Indian society, rather than the more aggregative, macro varnas.

Farming came to be largely dependent on the shudras, most of whom in the earlier phase of aryan conquest were landless and hence of very low status. By about the second half of the sixth century BC a social category even lower than the shudras appeared, the so-called untouchables, who were considered outcastes, beyond the pale of aryan society. They were assigned the job of scavenging. Thus the broad contour of the Hindu caste matrix was drawn. In

course of time thousands of divisions and subdivisions would spring up.

Lal's thesis is that the caste system provided a subtle and enduring answer to the aryan's need of maintaining rural labour supply. It established a decentralised system of control which did not require any overall and larger political community to oversee, and it confirmed that any attempt to start new settlements outside its map would be difficult if not impossible. The division of labour by caste and its enforcement by local social ostracism were central to the schema.

Any oppressed group planning to leave a particular village to set up on its own would find that, if it were confined to a single caste group, it would not have the necessary complementary skills specific to other castes to start a new settlement. They would therefore have to recruit members of other complementary castes to join them in fleeing the aryan perimeter. The likelihood of that would be remote. For some of those other complementary castes would already have a high ritual and economic status, with little incentive to move to the more uncertain environment of a new venture.

Lal illustrates Robinson (Crusoe) Chatterjee, stranded alone in an island would not survive long. For, being a brahmin he would not fish, till land, or climb a tree to gather mangoes. Likewise, one may add, Robinson (Crusoe) Kamar, in a similar plight, will perish almost the same way as he knows nothing but the craft of a blacksmith. Even before starvation he may die of shame as there is no priest around to do 'puja' for him and bless his soul every morning.

The division of the labour along caste line could be maintained, Lal claims, purely through the instrument of social ostracism without a central church or political coercion. He cites Akerlof's model of caste equilibrium as a proof of 'An Economic Rationale for the Hindu Social System'.[4] But I see little relevance of that algebraic construction, however elegant, in the context of our ancestor aryans, some three thousand years ago, pondering over how to send labour to the farm on the valley. Here are my reasons for doubt. The Akerlof production function has only labour as input. Labour is of two kinds, namely, vaishya and shudra, to use the terminology of Lal [1988:41]. Now comes the rub. The firm's production function is additive. And that robs Lal of his own argument in favour of caste system, that is, the organic complementarity of caste division of labour. For given such a decomposable production function all shudras could just walk out of the aryan captivity and live happily ever after in a separate village of their own.[5] Well, let that pass.

Second, the wage rate is equal to the marginal productivity of labour by assumption. The production function is, of course, homogeneous of degree one. So at the end of the day the entire product gets exhausted paying for wages.[6] Under the circumstances the high-caste Hindus would have nothing left to eat. Well, let that pass.

Third, the high-caste Hindus have read their Machiavelli carefully. They know that once a tradition gets started and runs for a while the word will get around. Information being an expensive item, if for nothing else, poor vaishyas and shudras will imitate whatever they see and hear, imitation being a deep-rooted attribute of human nature.[7] Soon the atmosphere would look like that of a decentralised costless general equilibrium so familiar to economists.

But that tranquillity at the surface is a bit deceptive. The machinery of caste has as a set-up cost as well as operating costs. To introduce and maintain a caste regime, one imagines, it would take a lot of scriptures, slokas, mantras, rituals, pujas, and tons of ghee, not to mention threats and actual application of royal force on occasions. All this does not come free. The moment such costs are inserted in the Akerlof model the results are somewhat disturbing. The ratio of vaishya and shudra labour now becomes subject to a specific law of motion.[8] Contrary to what Lal assumes implicitly, it is too much to expect the caste system by itself to preserve that required castewise proportion over three millennia, unless human procreation is functionally and appropriately related to caste. To bring about the necessary labour-market equilibrium by regulating with caste codes the human habits of reproduction in an economy no less complex than that of Walras or of Arrow-Debreu would be no mean feat, if possible at all.

Europe had slavery. China had a sort of serfdom. Maybe, the aryans in India could not try either for whatever reason. Is there any other way? Besides caste control at least two more come to our mind. To begin with, we ought to distinguish between ends and means. The basic problem of the non-working aryans in the Gangetic valley was to procure a steady supply of *surplus-product* from primary producers, not a captive supply of farm labour as such. Tying up low-caste people to inferior jobs is just a means to that end. They could have got that surplus-product by extracting in a market what Marx calls 'absolute rent' as distinct from the Ricardian differential rent. That would, of course, require regulating the supply of land, which was not impossible. Land was never free or in excess supply. In those virgin swamps of tropical forests on river Ganga, land had to be cleared and reclaimed at high cost. Cultivation also involves operating costs – seeds, irrigation, manure. In a word, the poor could not afford it on their own.[9] Under the cirucmstances regulating land supply would have been presumably no more difficult than fine tuning labour supply to myriad jobs by monitoring demography subcaste by subcaste which is done in Lal's schema.

A fifth alternative suggests itself. After all, necessity is the mother of invention. In history technological innovation has been the society's response to resource constraint. All those resources which the Hindus poured into running the caste show could have been better spent on making labour-saving devices if labour was the bottleneck. Our ancestors have revealed their competence in many a field. Why they misused this route remains a mystery to me.

We have argued that caste cannot be an efficient mechanism for intersectoral allocation of labour. Nor can it be an effective valve for modulating aggregate labour supply. Since there was very little activity outside of agriculture, and no city to flee to, the question of 'tying labour to land' does not arise. And the caste tag is not a high boundary-wall around affluent aryan villages, nor is it a fence posted on the ground, nor even a hammer to pound with; so it could not be wielded as a means to nail a person down to a particular village or to a specific landowner. Caste was conceived in the womb of racial prejudice, not of economic calculus. Once born it has had its own life. It has served as a tool of exploitation. Lal reached wrong conclusions because he asked wrong questions. He focused on wrong periods of history. He should have positioned himself at the dawn of the creation, not at the high noon of caste configuration captured as it is in the Akerlof model. This completes our proof of the following.

Theorem: Lal's doctine of so-called Hindu equilibrium is false. Division of labour by caste cannot sustain long-run economic equilibrium. It condemns the economy to stagnation and decay. QED.

A reviewer has the liberty to question an author's construction without offering a replacement. Regardless of that privilege I shall venture to speculate on how the caste system, despite its weaknesses came into force in the first place, and then

what makes it stubborn.[10] I shall do it by analogy.

For over a century the first six keys on the top row of letters on a typewriter are Q, W, E, R, T, and Y. But this keyboard is not the optimum arrangement of letters for promoting speed and accuracy of typing. Most of the world's records for speed typing have been set on typewriters that use the Dvorak Simplified Keyboard (DSK), patented in 1932 by August Dvorak and W L Dealey. Yet the QWERTY standard has not been overturned; on the contrary now it has even invaded by the personal computer. This phenomenon is explained in terms of 'network externalities' on which there is a vast and growing literature.[11] At a more formal level using the mathematics of non-linear Polya process it can be shown that "the technology that comes to dominate – the structure that emerges – does not necessarily have to be the 'best' or most efficient; events early on can lock the system into an inferior technological path."[12] Furthermore, "once a single-technology structure emerges and becomes self-reinforcing it is difficult to change it. If it were desirable to re-establish an excluded technology... an ever-widening technical changeover gap would have to be closed."[13]

At the dawn of the aryan era in India there were five conceivable agrarian and social 'technologies', namely, (a) slavery, (b) serfdom, (c) labour-saving innovation, (d) extraction of absolute rent, and (f) caste division. No one has yet demonstrated the superiority of the fifth over the others. Yet by some quirk of history it got introduced in some remote past, and have stayed there till today – in free democratic India. This is an instance of a path-dependent process, "where the past is present in the future".[14] Voters and their leaders in parliamentary democracy may appear perfectly 'free to choose'. Their behaviour, nevertheless, is moulded invariably by events long forgotten and shaped by circumstances in which neither they nor their interests figured. Like the great men of whom Tolstoy writes in *War and Peace*, "[e]very action of theirs, that seems to them act of their own free will, is in an historical sense not free at all, but in bondage to the whole course of previous history..." (Book ix, ch 1).

The initial line of racial demarcation between aryans and non-aryans had long been washed away by the flow of time; the original ground for discrimination had vanished over the millennia. Only its phantom haunts us even today. To break away from this tyranny of history we must listen to Mohandas Karamchand Gandhi: "Down with the monster of caste that masquerades in the guise of Varna".[15]

Despite my disagreement on several points I must say this book is an epic; it is a mirror at which we can reinvent ourselves.

Notes

1 Philosophers, to be sure, draw their concepts from the surrounding conditions [Russell 1945] Over the centuries several systems of thoughts have enriched human consciousness. Western philosophy focuses on the physical universe, while Indian philosophy meditates on the individual's communion with metaphysical, and the Chinese thoughts contemplate on social order [Radhakrishnan 1952.6] I am not sure if this regional variation can be fully explained with reference to hills, rivers, and deserts.

2 Adam Smith (1759, 1776) invokes two sets of human faculties or propensities that make society viable One is man's "original desire to please, and an original aversion to offend his brethren"; it is a centripetal force that holds the society together. This we call fraternalism The other is man's pursuit of his own self-interest, encoded in the famous sentence: "It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest " This is individualism, potentially a centrifugal force On the former Smith (1759 140-41) writes· "Man .ought to regard himself, not as something separated and detached, but as a citizen of the world, a member of the vast commonwealth of nature.. Whatever concerns himself, ought to affect him no more than whatever concerns any other equally important part of this immense system." Smith continues "We ought to view ourselves, not in the light in which our own selfish passions are apt to place us, but in the light in which any other citizen of the world would view us What befalls ourselves we should regard as what befalls our neighbour, or what comes to the same thing, as our neighbour regards what befalls us."

3 Aristole defines 'man' as 'rational animal' Rationality can be given a narrow meaning - formal consistency, or non contradiction in the sense of classical logic. Aristole has three laws of thought: the law of identity (A is A); the law of non-contradiction (nothing can be both A and not-A); and the law of excluded middle (something is either A or non-A), where A stands for anything whatsoever. In formal logic these laws are rendered as truths about propositions respectively. if p, then p; not both p and not-p, and either p or not-p, where p is any proposition. Economists usually reckon rationality as mere conformity with these laws

Rationality has another, far deeper, connotation in which it is identified with 'reason' — reason as a faculty of thinking and exploring the reality. Man is a rational animal in both the senses of rationality, narrow and deeper

4 This is done in the earlier book, Lal (1988:41-45), the argument is carried over to Lal (1998)

5 Let q be the output of the firm, x vaishya labour, x' shudra labour, and a and a' their respective marginal productivities. The production function in Akerlof (1976) is: $q = ax + a'x'$, as shown in Lal (1988:41). The two inputs are perfect substitutes; the isoquant is a straightline. Output can be produced with either x or x' alone. So, the shudras can run away and setup their own colony.

6 Let w and w' be the wages of vaishya and shudra labour respectively By the marginal productivity theory of wages, $a = w$ and $a' = w'$. So, $q = ax + a'x' = wx + w'x'$ This is the standard condition of zero profit in perfect competition After meeting the wage bill the landowner will have nothing to eat

7 See Bikhchandani et al (1992, 1998) and De Vany and Walls (1996).

8 Let t denote tax to meet setup and operating expenses of caste administration. The equation of note 6 above now takes the form. $ax+a'x = wx + w'x' + t$. Rearrangement of terms yields· $x/x' = [(w'-a')+t/x']/(a-w)$, or equivalently, $x'/x = [(a-w)-t/x]/(w'-a')$ The model no longer allows: $a=w$ and $a'=w'$. The point is that as a result the vaishya-shudra labour ratio gets precisely specified by the model Who or what guarantees the maintenance of that proportion in the economy?

9 True, "of the three elements of an agricultural structure... - free land, free peasants, and non working landowners – any two elements but *never all three can exist simultaneously*" [Domar 1970·21, emphasis in the original] Here Domar is talking of Russia in 16th and 17th centuries and of western Europe in the closing days of Roman empire.

Lal invokes Domar to rationalise the Hindu ensnaring of the poor in caste trap. But we must remember that for the aryan gazing over the marshy tropical forests on river Ganga the scene was vastly different. By no means was land free The Domar model does not fit here

10 Caste system is still going strong in India "One recent survey in eastern Uttar Pradesh for instance, finds that as many as two-third of the headmen in 82 surveyed villages belonged to the thakur caste – the traditional landowning upper caste in that region notorious for oppressive subjugation of the lower castes" [Dreze and Sen 1995:105n 106n] "In Uttar Pradesh, for instance, it is still possible to find villages where a powerful landlord has actively opposed the creation of a village school" [Dreze and Sen 1995:107] This phenomenon of landlord resistance to the spread of elementary education has been noted elsewhere in north India.

A Much Studied State

K R G Nair

Industrialisation in Kerala: Status of Current Research and Future Issues by P M Pillai and N Shantha; Centre for Development Studies, Thiruvananthapuram, 1997; pp 74, Rs 110.

KERALA has always fascinated researchers because of its being an outlier on a chart of commensurate development in economic and social spheres. The relatively low level of economic growth as indicated by low per capita state domestic product has also been accompanied by incidence of considerable levels of poverty and unemployment. The Kerala model of economic development is hence increasingly coming into question in recent years. Further, even when the Kerala model was in vogue, doubts used to be expressed about the adequacy of the development of manufacturing industry in the state of Kerala. The status report on current research on industrialisation in Kerala by Pillai and Shantha hence addresses an issue of great contemporary relevance.

Faithful implementation of pro-poor policies by relatively more enlightened governments in Kerala is often stated to be the main hurdle in the way of Kerala's industrial development. It is argued that sincere implementation of land reforms and minimum wage legislation has resulted in low capital formation and militant trade unionism. All this, it is said, has led to low productivity of labour, low level of capital formation and flight of capital and enterprise away from Kerala particularly in the field of industry. Pillai and Shantha have quoted the results of a number of detailed studies to clearly show that such views have to be taken with not a pinch, but a spoonful of salt.

It is heartening to know from this status report that the rate of savings in Kerala is higher than that for India as a whole. It is also interesting to note that it is more factors relating to the structure of industry and not region-specific factors which are responsible for Kerala's low rate of industrial growth. It is also revealing that the feeling that industrial relations are relatively worse in Kerala compared to the neighbouring states is a mere perception and is not based on facts.

The status report is in fact very well presented. It is split into seven chapters and begins with an introduction giving the *raison d'etre* of the study. After a brief review of historical studies in chapter 2, the survey goes on to discuss studies relating to the traditional, modern and small-scale sectors in chapters 3 to 5. Chapter 6 examines the different organisational structures being tried mainly in the public sector, critically evaluating their relative performance. The concluding chapter is a welcome one and identifies a number of issues for further research in the field. Besides, the usual bibliography, the status report also contains a very useful Appendix giving source material for different types of studies on industrialisation in Kerala. The brief status report has been very painstakingly brought out and contains very few printer's devils.

Research by correspondence has many pitfalls and there are distinct advantages if the researcher is in the area that is being researched. From this point of view, the starting of research centres including the Centre for Development Studies (CDS) away from the capital in the 1970s and 1980s was expected to promote regional balancing of research both in terms of origins of research and also of the region researched. Hence, the fact that the bibliography to this monograph lists a large number of MPhil and PhD dissertations dealing with this issue is very gratifying. The authors deserve congratulations for putting these, many unpublished, together for future reference by researchers.

In the view of many, however, no survey on regional development in India is complete without reference to the seminal work in this regard by Galina Sdasyuk and P Sengupta and published by the Registrar General and Census Commissioner of India (1967), not mentioned in the report here. Works like the one by Seth (1987), dealing exclusively with regional development of industry, which can definitely help one gain sharp insights to Kerala's industrial development also find no place in the report. It is true that the authors have admitted that theirs is not an exhaustive survey of work in the field. But readers cannot be blamed for missing these relevant pieces of research in a status report dealing with the topic.

One also looks in vain for a certain critical assessment of the works cited. The study lists the NCAER Techno-economic Survey of Kerala without any reference to industrial sectors identified for development in Kerala. One would have liked to know the extent to which the predictions of crystal gazing three decades back have turned into reality. The exact point of time till which studies done are taken into account in the status report is not mentioned by the authors. In fact one of the interesting pieces of work in the field is by Sunil Mani (1996). One wondered why this work does not find a place in the status report brought out in 1997, till one finds out that this status report was prepared in early 1996 and actually finds a mention in Sunil Mani's work.

The Black Economy

Missing Dimension of Macro Policy-Making in India

Arun Kumar

The major macro-economic problems of the 1970s and the 1980s were integrally linked to the growing phenomenon of black income generation. The black economy should, therefore, have been a significant factor in analyses of the economy. Its non-inclusion in analyses resulted in a partial understanding of the Indian economy and often incorrect policy pronouncements. This paper describes the institutional practices of the black economy and incorporates it into the short run macro analysis of the Indian economy.

The need to incorporate the black economy is not simply an empirical matter, but a theoretical necessity. The circular flow of incomes changes with the black economy. Black incomes are first defined. Transfers are not included, but their implications for national incomes, savings and velocity of circulation are presented. The theoretical analysis yields counter intuitive results with regard to tax evasion, investment and savings, subsidies, balance of payments, etc. The empirical trends since the 1970s, say, with regard to unemployment, inflation, the fiscal gap, current account deficit or investments and savings can be better explained using this framework.

I
Introduction

ECONOMIC policy making is based on an analysis of the economy as it is perceived to exist (called 'theory') and the goals that are considered desirable. The analysis unravels interrelationships amongst what are considered to be the key variables and the policy-maker uses this understanding to try and achieve the desired goals Often, in India, policy has not achieved the intended

This failure could be for several reasons of which two important ones are (a) the theory itself may be erroneous or inapplicable to the particular case and (b) implementation may be faulty. Some deal with the latter as an aspect of the former rather than as independent factors. This is an example of differences in perceptions amongst analysts and a pointer to disagreements amongst economists or policy-makers over what is theory. One strand of thinking is that theory must correspond to facts and independent of that it has no existence except as a curiosum.

The relationship between theory and facts is a tortuous one. It involves a process of abstraction which is not unique and on which there is seldom agreement amongst economists from different schools of thought. Often there are difficulties with the data (facts) itself. Many theories are supported by the same limited set of facts This is familiar to Indian economists. One aspect of a weak data base in India is the existence of a substantial black economy. This makes variables unobservable or only partly observable. Consequently, while a theory should be tested with the complete data set, often that has not been possible.

For instance investment and savings in India have a link with the black economy so that they are partly unobservable Hence, the observed data will not show the expected equality between the two In fact, data may be farther distorted by imposing an equality through the category of errors and omissions Further, if the BOP data are strongly influenced by smuggling, under- and over-invoicing and flight of capital and these are not taken into account then the usual three-gap model used for analysis may lead to erroneous policy prescriptions.

If the size of the black economy was insignificant, error due to its existence would be small and analysis could be treated as a first approximation This is legitimate since precision in economics is seldom feasible However, most estimates (including guesses) suggest that since the 1980s, the size of the black economy may be upwards of 20 per cent of the GDP. In other words, it is comparable (not that it is a sector in the National Accounts) to the contribution of agriculture or industry to GDP.

Consider, input-output ratios cannot be measured accurately for industries where the black economy is substantial [see section on the sugar industry in Acharya and associates 1985]. If underestimation of output is widespread even for the organised sector in industry (not to mention the unorganised) and excise duty evasion seems to suggest that, the contribution to GDP may be seriously underestimated and capacity utilisation or factor productivity underestimated.

Economists both from the Left and the Right have largely ignored the existence of the substantial black economy in India.[1] This poses two classes of problems. The first relates to the measurement of key variables and the second to analysis. Secondly, even if the true magnitudes of the black and the white part of the variables could be obtained, there would be problems with analysis. The interrelationships amongst the black and the white variables taken independent of each other may turn out to be different from that assumed for the whole economy. Moreover, there may be cross-relationships between the white and the black components In effect analysis based only on the white part of the data is likely to be erroneous when the black economy is substantial.

The New Economic Policies (NEP) introduced in 1991 mark a major shift in policy paradigm. According to the proponents of these policies, this was necessitated by the failure of policies prevailing till then. However, neither the analysis of the failure of earlier policies nor the NEP take into account the existence of the substantial black economy in India. In other words the shift in policies is based on inadequate analysis. A prerequisite to policy change is an understanding of the nature of the crisis in the Indian economy, why it developed and whether the NEP are the required corrective?[2] As a backdrop to this analysis it is useful to ask, what is the government's case for NEP?

The article presents in Section II the macro-economic case for NEP and its critique on the ground that it ignores the black economy. Section III argues that the black economy is significant in the Indian economy. Section IV presents the modified National Income Identity incorporating the

black economy. Section V uses the modified identity in a short period setting to draw inferences relevant for macro policy-making. These results are used in Section VI to point to certain macro features of the Indian economy which have been otherwise ignored. In Section VII, these results are used to reinterpret the observed macro-economic trends in the Indian economy since the 1970s. Section VIII is used to critically analyse NEP in the expanded framework to assess its likely impact. Finally, in Section IX, certain policy conclusions are drawn.

II
NEP's Macro-Economic Case

The proponents of NEP listed the following economic problems which need correctives. The growing international debt and the BOP crisis. The rising fiscal deficit, the high rate of inflation and slow economic growth. Technological backwardness was identified as a critical factor in the slow down in the rate of growth of the economy and the continuing inability to export enough to meet the rising import bill. The public sector because of its net negative savings was identified as the cause of the growing fiscal deficit. NEP are supposed to deal with these and other related problems [see GOI 1993].

The opening up of the economy is supposed to make it more efficient. Inflow of foreign capital is expected to upgrade technology and boost exports. Privatisation of the public sector is taken to make it efficient and reduce the drain on the exchequer. Cuts in expenditures like subsidies and transfers to the states were suggested to reduce the fiscal deficit which in turn is supposed to lower the rate of inflation and eliminate the BOP crisis. The following National Income Identity (model) consisting of the three gaps in the accounts of the private sector, the public sector and the external sector forms the basis of these arguments.[3]

$I - S = M - X$ where I stands for Investments, S for Savings and X and M for Exports and Imports, respectively, of goods and services.

$M - X$ = Inflow of foreign capital, or the supply of foreign savings. The above identity with two gaps can be rewritten in the following form:

$$O = (I - S)_{private} + (I - S)_{public} + (X - M) \qquad ...(1)$$

It has been argued that for the Indian economy, the gaps in the private and the external accounts have been negative while that in the public account (the fiscal deficit) positive. In other words, the fiscal deficit is financed by the private sector and the external sector. The inflow of external resources, year after year, resulted in the rising external debt and finally to difficulties on BOP account. The inability of the national private sector to finance the public sector is supposed to result in excess demand and inflation. Following this argument, a reduction in the fiscal deficit would reduce demand and help cure both inflation and the BOP crisis. Devaluation was recommended to reduce the leakage of demand from the national economy and to generate an export surplus to overcome the problem of rising debt.

In the longer run, the NEP hope to stimulate private savings, investment and exports through concessions to profit earners. The opening up of the economy is supposed to enable inflow of foreign capital and associated technology. Removal of rigidities in the system (freeing of prices, exit policy, etc) are supposed to enable free movements of capital and its more efficient use. While overall demand is sought to be curbed, it is assumed that growth will follow supply side responses.

Critique of NEP's Marco-economic Formulation

Such an analysis suffers from five problems. Firstly, it relies on use of official data which are based predominantly on the white economy. Secondly, by itself eq 1 does not tell why the causation will run from the fiscal gap to the other two. Thirdly, even if the causation is accepted, in a given situation, what will be the split between the other two gaps, i e, the impact on inflation or the BOP? Fourthly, the time period involved in the (ex-ante) analysis is never clearly specified. Lastly, there are important analytical linkages between the three gaps that are missed out when only the white economy is taken into account.

Take the first point. The use of data from the white economy alone in eq 1 is erroneous since the equation refers to the actual values of each of the variables consisting of the white plus the black magnitudes. Hence the equation cannot be expected to be fulfilled with data from some undefined portion of each of the variables. Since the white portion of each of the variables is a different proportion of the total value, it is not even that the former can act as a proxy for the total.[4] As shown in Appendix 3, when the actual magnitudes are used, the sign of the external gap turns out to be different from the one assumed above. This is due to a leakage of savings from the Indian economy in the form of flight of capital and smuggling in of gold, sliver and other items.

Secondly, eq 1 is inadequate from the point of view of causation [see Bacha 1990]. It is unclear (a) why output and price changes do not close the $I - S$ gap internally and (b) whether $M - X$ leads to this gap or its result? Answers to these questions are essential for policy formulation. Further, any concessions to capital for investments and exports (as suggested by NEP) raise the share of profits in national income (if they are to act as incentives). The implication of this for output and price adjustment cannot be studied without explicitly introducing distribution in the national income identity (eq 1).

Thirdly, it is clear from eq 1 that the impact of the fiscal deficit on the external gap is dependent on the degree of openness of the economy. In a closed economy, no matter what the fiscal deficit is, the external gap would be zero. As the economy opens out, the fiscal deficit would have a larger impact on this gap but its extent is unclear.

Fourthly, often, the variables in eq 1 are rewritten as functions of some other variables [Bacha 1990] – like consumption and imports as functions of income. This implies an implicit use of more than one time period but then investment becomes a more complex variable dependent on expectations and time lags. This needs to be clearly spelt out to make the ex-ante analysis needed for policy purposes feasible.

Lastly, each of the three gaps are affected by the others because of the generation of black incomes (see Appendix 2). For instance, the true investment in public sector is less than the budgetary magnitude due to the siphoning off of funds. This shows itself as the savings of the private sector both inside India and outside. Savings of the public sector are also affected since profits of the public sector are skimmed off during sales and purchases of inputs. These once again accrue as the savings of the private sector (households or firms). In effect, the public sector gap based on the white data turns out to be larger than it actually is because of the transfer of savings to the private sector. In reality, public sector's investments are smaller while its savings are higher by the amount of leakages. Transfer of savings from the public to the private sector both within and outside India has been going on.[5]

If the above analysis is correct then it is clear that the national income identity, eq 1, has to be rewritten (a) incorporating the black economy explicitly to bring out the interrelationships amongst the various variables, (b) using only the short period for analysis, (c) incorporating causation, (d) explicitly bringing in income

distribution, and (e) using the true magnitudes in the modified national income identity.

III
Does Black Economy Matter?

The Magnitudes

The size of the black economy, usually reported as percentage of the reported GDP at market prices, is substantial, whichever method of measurement is used. Acharya and associates (1985) estimated the size of the black economy (not counting smuggling and illegal activities) to be 20 per cent of the white economy for 1980-81. Gupta (1992) pointing to errors in this estimate corrected it to 42 per cent of GDP for 1980-81 and 51 per cent for 1987-88. The monetarist estimates yielded a figure of 47 per cent for 1978-79.

Kumar (1994) suggested that estimates from different methods are not comparable because of the various definitional and methodological inconsistencies and problems in these estimates. Most importantly, due to lack of definitional clarity, there is double counting and transfers and capital gains are clubbed together with factor incomes. Correcting for these infirmities, Kumar and Sen (1993) assumed in their calculations a figure of 30 per cent for 1990-91.[6]

This implies that the black economy which is concentrated in the tertiary sector [Kumar 1988b] was by 1990-91 larger than the primary or the secondary sectors. If so, can it be ignored in any macro analysis of the Indian economy? For instance, in the analysis of output of goods and services or demand (specially consumption) patterns.

Can one treat the white economy as a proxy for the total economy, consisting of the black and the white components? This would be possible only if the various ratios remain unchanged. But on available indications (Appendix 3) this would be an incorrect assumption so that the black economy needs to be explicitly introduced in the analysis. All this has major implications for analysis and policy.[7]

With regard to the external sector also, the magnitudes of the black economy in relation to the official data are very significant. For instance, while official exports in 1990-91 were $18 bn, 170 tonnes of gold valued at Rs 6,000 crore ($2.2 bn) at the then current domestic prices was smuggled in. In 1990-91, there was an estimated annual flight of capital of $5 billion and smuggling of other items (silver, electronics goods and synthetics) of at least another $1.5 bn. This is financed through two sources. Firstly, the havala markets which short circuit the accrual of foreign exchange to government reserves. Some of these items are remittances by Non-Resident Indians and under- and over-invoicing of exports and imports. Secondly, the profits from drug trafficking.

Further, savings held abroad (in foreign exchange) by Indians were said to be at least $100 bn. Interest earned on this would have been at least $6 bn (annually). Adding up all this, the country lost in 1990-91 foreign exchange of at least $15 bn, not counting drug traffic earnings. This amount would be equal to 80 per cent of the official exports. If this loss had not occurred, in 1990-91, the country would have had a current account surplus and not a deficit of $9.7 bn.

This is not all, the black economy raises the import intensity of the economy and causes legal imports to rise. As such, the country's BOP cannot be discussed without taking into account the black economy and the leakages from it. Finally, the flight of capital, smuggling in of gold and other items are an aspect of the black savings in the national economy so that no meaningful discussion of the savings-investment behaviour and the associated multiplier, etc, is possible without taking into account the black economy in India.

National Income Accounts and Black Economy

Analysts ignore the impact of the black economy on the macro-economy either because they have not developed the required analytical framework and/or because they argue that the data are not available (or are unreliable). Apart from the fact that if the black economy is as large as estimated by some, and, therefore, analysis not taking the black economy into account is erroneous, analysts are happy to use the data on the white economy

Appendix 1. Estimates of Elements of Black Investments and Savings
(As per cent of white GDP at market prices)

Given the definition of black incomes used in this paper, only factor incomes are considered. As such, investments in real estate, transactions in the secondary share markets, capital gains, bribes, etc, are not considered here. As far as possible, estimates are given for 1990-91

(1) Siphoning out of public sector savings through cuts on sales and purchases and over-invoicing of investments 6 per cent of value Small projects may have 15 per cent leakage and the large ones 6 per cent Additional activities, like, bank frauds, financial irregularities, electricity leakages need to be estimated. This is like a minimum estimate.	5.3 per cent
(2) Under-invoiced inventories at 20 per cent of increase in inventories	0.3 per cent
(3) Over-invoiced plant and equipment in the private sector Assume that it equals the capital required to be put in by the private owners of the companies, i e, 16.5 per cent of the capital declared to have been invested	0.8 per cent
(4) Smuggling in of gold, silver and gems and jewellery	1.9 per cent
(5) Flight of capital through over- and under-invoicing of exports and imports	1.6 per cent
(6) Transfer of funds through the havala route.	1.0 per cent
(7) Profits on drug traffic accruing to Indians	3.7 per cent

Appendix 2: Actual Investment, Savings, Export and Import Definition

Actual $I = (I_{priv} + I_{pub})_{white} + (I_{priv} + I_{pub})_{black}$
Actual $S = (S_{priv} + S_{pub})_{white} + (S_{priv} + S_{pub})_{black}$
Actual $X = X_{white} + X_{black}$
Actual $M = M_{white} + M_{black}$

The black components above may be written in terms of their components as.

$I_{private, black}$ = incremental holding of gold, silver, gems and jewellery and balances in foreign accounts – over-invoicing of investment + under-invoiced inventories (including holding of commodities for speculation) + undeclared investments in the formal and informal sectors (including, for speculation) + increase in cash holding + investment in illegal activities.

$I_{public, black}$ = over-invoicing of investments

$S_{private, black}$ = Black savings propensity ∞ [over invoicing of private investments + over-invoicing of public investments + over-invoicing of purchase of material (including, wages) + under-invoicing of sale price + value of undeclared production (legal and illegal) + cuts on contracts of public sector] + black savings of informal sector – benami investments in banks and post offices

$S_{public, black}$ = Cuts on contracts for sales and purchase of goods and services

X_{black} = Under-invoiced exports + export of drugs + under-invoicing of tourist expenditures + savings of Indian labour working abroad retained there through the havala route + returns on assets held abroad.

M_{black} = Under-invoiced imports – Over-invoiced imports + smuggling + Indians undeclared expenditure abroad on education, health and tourism

Gold, silver and gems and jewellery are included in I since they imply equal investments abroad through leakage.

whose statistical basis is often no more firm than that relating to the black economy.

Data from the unorganised sectors of the economy have a weak basis [GOI 1989]. This is true both for the manufacturing sector and the tertiary sector. Often these are only crude ratios of the organised sector activity or based on inadequate benchmark estimates which are then blown up by equally inadequate indicators. The finance minister has indicated that excise duty evasion maybe of the order of 40 per cent [Budget Speech 1993]. This implies that even for the organised manufacturing sector, the official production data have a large margin of error. After all, data reported to the excise department are the data provided to the income tax department and the Annual Survey of Industries (ASI) and these are the data used in the National Income Accounts.[8]

If the degree of uncertainty is as high as 40 per cent of the output for the sector whose data are supposed to be the most reliable than in the case of the unorganised sectors (with substantial self-employment) and specially in the tertiary sector the degree of uncertainty is likely to be much more than 40 per cent.

Similarly, the implications of the previous section for the estimates of savings and investments are serious. They are leaking out of the country. Some of these are reflected in gold holdings in India, flight of capital and accounts held abroad by Indian nationals. None of these enter the national income accounts.

This opens the possibility that capital inflows from abroad are smaller that the outflow of savings from the black economy (Appendix 3).[9] Investments by foreigners in India are small but investments abroad by Indians based on the flight of capital and accruals from smuggling activities have been substantial. Thus while M – X based on official data may be positive, reflecting a net inflow of foreign capital, there is another term $(I - S)_{\text{foreign black}}$ from the Indian private sector which reflects a drain of capital. In effect, the white accounts have been misleading with respect to the savings behaviour of the economy.

Given that the margins of error in the various components of GDP may be large, how much faith should the analyst have on the GDP data from the national accounts? It is surprising that though the degree of uncertainty is large in each of the components of the GDP, yet, the sum of these components is used as if it is precise. Further, even though it is the existence of the substantial black economy which creates the errors in the data on the white economy, few analysts make the attempt to rectify this defect by incorporating the black economy into their analysis.

In brief, two points emerge regarding the use of data from the black economy. First, the degree of uncertainty in the data for the black economy is certainly higher but that is a quantitative matter and cannot be the reason for excluding the black economy from theoretical analysis. For instance, the issue is not only of the missed savings from the black incomes but of their direction of flow. Secondly, the uncertainty in the data for the white economy relates in a large measure to the existence of the black economy.

IV
Black Economy and National Income Identity

The arguments presented till now suggest that the black economy needs to be incorporated into the analysis. To do so, each of the terms in eq 1 need to be split up into two parts – a black and a white one. For instance, $(I - S)_{\text{private}}$ should be two terms; one pertaining to the white economy and the other to the black economy. The black economy part would consist of three savings terms; one from black savings from private activity, second from the public sector and third the leakage of savings from the national economy.[10] The I term also has three components – white, black and foreign investments (Appendix 2).

However, the modification of eq 1 to incorporate the black economy by splitting up the I and the S terms is not only complicated but inadequate from the point of view of policy and income distributional consequences. The form of national income identity used by Kalecki (1971) and as developed further in Kumar (1988a) is more suitable from both these points of view. The reason is that black incomes are property incomes, that is, factor incomes profits (gross) from which other property incomes derive. Kalecki uses national income identity to focus on the role of gross profits. He also highlights causation and the role of government deficits and the external sector in market creation. The identity given in Kumar (1988a) specifically enables analysis of policy. It is used here as the starting point to introduce the black economy in the framework and is written thus:

$$(P_p - T_p) + I = I_p + C_c + [\text{Budget Deficit} + B] + [\text{Current Account Surplus } (X - M)] \qquad \text{...(2)}$$

where p_p are private profits, T_p tax on these profits, I the interest payments from the budget to the propertied, I_p the private investments, C_c the capitalist consumption, B the *net* borrowing by the government, X the exports and M the imports. Clearly, eq 2 refers to the true economy consisting of the white and the black economies. The identity would not hold for just the white or the black parts separately. While T_p, B and I have only one component, each of the other variables of eq 2 has two parts. These need to be introduced explicitly in the identity to facilitate the analysis of an economy with a black component.

Undeclared Profits

Gross profits consist of the white and the black profits. White profits are the ones declared for tax purposes and T_p are the taxes paid out of them. No taxes are paid out of black gross profits since they

Appendix 3. Table of Corrected Values of Key Macro Variables (1990-91)
(Figures in Rs crore unless stated otherwise)

	White Comp	Black Comp	Actual Value
(1) GDP at market prices	5,35,000	1,60,000	6,95,000
(2) Primary	31 per cent	5 per cent	25 per cent
(3) Secondary	25 per cent	25 per cent	25 per cent
(4) Tertiary	44 per cent	70 per cent	50 per cent
(5) Gross domestic savings	24 per cent	50 per cent	30 per cent
(6) Aggregate investments	27.5 per cent	17 per cent	25 per cent
(7) Incremental K/O ratio	5.0	1.9	4.4
(8) Exports (goods and services)	41,000	55,000	96,000
(9) Imports (")	49,000	10,000	59,000
(10) Tax revenue foregone		1,00,000	

Notes. (1) Figures presented under black component are indicative based on scattered evidence and a broad understanding of the black economy.
(2) The per cent figures under actual value are the weighted average of the black and the white components.
Item 10: refers to both direct and indirect taxes assuming that incomes had been correctly declared.
Item 7. The rate of growth of black economy is taken to be 9 per cent and of the white economy 5.5 per cent. The increase in output of the black economy is not only due to investments in the black economy but also due to the misdeclared white output. This simultaneously raises the growth of the black economy and lowers that of the white economy.

are undeclared These are generated in several ways

First, by inflating costs in the books of accounts through showing higher expenditures For instance, personal expenditures are shown as business expenses Over-invoicing of purchases and falsification of employment data (muster rolls) are also used Second, gross revenue is understated in the accounts through under invoicing sales by misdeclaring the price or output or both The output may either not be shown or declared as damaged or shown as waste The actual cost of production of this undeclared output is loaded on to the declared output or turnover Third, there are illegal activities where the entire output is black For instance, in the case of smuggling prostitution, drugs, gambling, etc From these black activities a part of the profits accrue outside India

Out of the black gross profits undeclared interests and rent are also paid In partnership firms, undeclared dividend is also paid out of these profits Since profit interest rent and dividend are referred to as property incomes one can argue that black incomes *are property incomes* [Kaldor 1956 and Kumar 1988b] In completely illegal activities there is no question of declaring wages so that these also constitute black incomes However in the rest of the economy wages are inflated so that there would be a tendency for the under reporting of wages to cancel out Finally most wages even the illegal ones would tend to fall below the taxable limit so would not have been required to be reported hence are not black Anyhow as a first approximation it may be assumed that in the economy as a whole wages are not under reported

Black incomes may be defined as *factor incomes property incomes which should be reported to the tax authorities but are not* Capital gains and bribes are mere transfer activities and not factor incomes so are not counted as black incomes They do cause redistribution of incomes and effect consumption etc

With these considerations in mind in eq 2 above P_p needs to be separated into two parts white private gross profits P_{wp} and black gross profits P_{bp} Since the share of the black economy has been rising and the black incomes constitute gross profits, the share of gross black profits in GDP must be rising A part of these gross black profits accrue outside the economy and represent a leakage of savings from the national economy Data indicate that in the 1970s and the 1980s the share of white property incomes itself was rising [Kumar 1988b] It can then be concluded that the share of total gross profits in the national income must have risen during this period

Capitalist Consumption and Black Incomes

Capitalist consumption, C_c is paid for by both black and white incomes It is generally believed that consumption propensity out of the former is larger than out of the latter and also more import-intensive However the consumption propensity out of black would be much smaller than that of say the wage earners [11]

The savings propensity out of black incomes is also smaller than that of the property earners as a class because, as pointed out above there are transfer activities associated with them The transfers result in some incomes being redistributed to those with smaller incomes However most of the transfers are also highly concentrated so would have large savings propensity In other words an increase in the share of black incomes would cause the savings propensity to rise in spite of an increase in capitalist consumption [Kumar 1995]

Expenditures from black incomes are on items like consumer durables housing entertainment children's education abroad and visits abroad What is spent abroad is clearly import intensive but there is also an increased demand for imported goods in the national economy Earlier it led to increased smuggling activity to fulfill demand for foreign goods Post 1991 since import restrictions have been fewer smuggling may have declined but legal imports have expanded faster than the nominal GDP Indirectly also imports rise say to meet an increased demand for energy as luxury consumption rises

The goods consumed using black incomes do not necessarily originate in the black economy White incomes may be used to purchase goods or services produced in the black economy Hence no useful purpose is served in writing the black and the white components separately It is enough to recognise that in eq 2 above C_c would have a value larger than that implied by the white economy alone Expenditure out of black incomes may have a shorter time lag than out of white incomes but since in eq 2 there is only one period the short period, this has to be ignored in the first approximation

Black Investments

Private investments, I_p need to be split up between a black and a white component I_{pb} and I_{pw} It is not that the black component comes necessarily out of black incomes and the white one from the white incomes only For instance, savings from black incomes go into bank and post office accounts which channel them into white investments While I_{pw} is reasonably well known and presented in the NAS, the other term needs to be modelled I_{pb} may be classified into seven broad categories

(1) Under invoiced inventories (including cash holdings)

(2) Over-invoiced and under invoiced plant and equipment

(3) Informal sector activities including trade, films, production etc

(4) Illegal holding of precious metals gems and jewellery

(5) Flight of capital for investments abroad

(6) Transfer activities (like secondary share market and real estate) and buying of influence (bribes for illegal work)

(7) Illegal activities (like smuggling drugs, prostitution and crime)

Flows into real estate (not construction) secondary share market etc where assets simply change hands constitute transfers and do not result in production They result in large transactions but little value addition (brokerage) and cause the transactions velocity of money to rise but the income velocity hardly changes The multiplier associated with these activities is indeed small

To the extent that some of these transfers may be to those who have small incomes say widows and small farmers they lead to an increase in consumption lowering the savings propensity in the economy However the bulk of these transfers are to other propertied who then make a decision to invest the proceeds This holds for both the black and the white components of these transfers As long as these investments circulate in transfer activities like say from one property to another, the savings remain immobilised lowering the income velocity of money At some stage they may link up with productive investments but until then they lower the profile of investments and increase liquidity

Given the overall macro black balances and practices in the black economy black savings (including the ones transferred) will flow into each of the remaining six black investment channels Some of these channels result in leakage of savings from the economy and require conversion into foreign exchange either through exports or through cornering private capital inflows (through havala) In the case of the havala transaction rupee proceeds are paid within the economy and the transfer continues or consumption rises while savings leak out abroad

Investment in precious metals, gems and jewellery is also like a transfer activity. A leakage of savings takes place when precious metals and gems are brought into the country or when there is flight of capital. The country also loses foreign exchange in both the cases and affects the BOP. However, there is a minor difference between the two cases. When precious metals or gems which are smuggled in are held, assets are purchased in the economy but savings are lost to the economy. In the case of flight of capital, the national economy loses savings but Indians still own the savings abroad. In the two cases, even though the same havala market is used, in the former case, the chain of transactions is longer due to the transfer of goods (which are simultaneously assets) involved.

In effect, the transfer activities of the black economy either lead to larger consumption or savings leak out of the economy or they are invested in some white or other black activity. Investment in other black activities gets counted under those heads. The tendency of investing black savings in the white economy cannot be large (otherwise they need not have been generated as black). As already argued, consumption out of these incomes would also not be large so that the major avenue left would be leakage from the national economy. To conclude, black savings when invested in activities which are not counted in the national income account lead to transfers from one black investment to another till they largely leak out of the national economy. The leakage of savings corresponding to these transfers requires surplus on the current account so that foreign exchange is earned to enable the leakages to occur. However, these leakages involve illegal activities.

Increase in under-invoiced inventories is undeclared investment, that is, investment through the black channel. Increase in cash holdings is likely to be a small part of the total. On the contrary over-invoiced plant and equipment implies a lower real investment; in fact, negative black investments. Under-invoiced investments, like, undeclared investment in construction, imply that the actual investments are larger by this amount. An important component of this investment is the flow of incomes from illegal activities (like drugs). Finally, undeclared investments and investment of black savings in the informal sector implies that I_{pw} rises as unfulfilled projects get funded and working capital made available. Investments in illegal activities also raise the level of investment in the economy.

In brief, only a part of what are understood as black investments constitutes real investments in the national economy. It is this component which raises the level of output through the associated multiplier.[12] The total investment in the true economy is then larger both because the size of the economy is larger and also because of the higher savings propensity out of black incomes. However, it is smaller than what it could be because of the transfer activities, illegal activities and the leakage of savings from the national economy.

The picture is akin to the distinction between productive and unproductive investment referred to in Bhaduri (1983) in the context of agriculture. Here the distinction is that the white investments have a larger multiplier associated with them as compared to the black investments. A part of output from white investments is not declared and generated black incomes while black investments mostly generate black incomes but due to leakages, have a small multiplier.

Budget Deficit and Public Sector

The impact of the black economy on the budget deficit is both because expenditures are inflated and revenues are less. For instance, when contracts are awarded, margins must cover pay-off to politicians and bureaucrats and super profits. Fictitious expenditures are claimed. Revenues are less because tax collections are less than what they could have been. Even non-tax revenues are affected. For instance, the profits of the public sector are lower since they are siphoned out. As a result, their contribution to Internal and Extra Budgetary Resources to finance the public investments programme get reduced and their dividend to the government reduced.

Large amounts of subsidies are also siphoned off by propertied through misappropriation. Like traders diverting grain from public distribution or FCI paying more for poor quality grain. Subsidised public services cornered by those in power are also transfers to the propertied. Expenditures on subsidies get inflated or misappropriated.

The rapid rise in the interest burden on the budget is a result of the black economy. White liquidity is preferred over black liquidity due to its greater flexibility of use and lower risk. Consequently, the return on black investments have to be higher than on white investments. Further, the rate of return available on black activities is higher by the tax saved so that the post-tax rates of return on black activities turn out to be much higher than on white activities. Amongst the white activities, the interest rates offered by the government provide the floor rate of return for the economy as a whole.

With an increasing share of the black economy, a disequilibrium arises. The white rates of return tend to rise as demand for funds from the state grows and this leads to a sympathetic rise in the black rates of return. To pre-empt funds from flowing into the black economy so that the state can fulfill its requirements, the state has had to offer higher returns on funds

Appendix 4 Increase in Costs of Production in Organised Industry

The black economy enhances three major items of costs for industry, namely, transactions costs, indirect taxes and interest costs

(1) Transactions costs
   (a) Purchased input (material and labour) costs increase due to bribes and over-invoicing.
   (b) Capital costs rise due to delays, bribes and over-invoicing.
   (c) Due to inferior quality of inputs and extra processing cost.
   (d) Higher working capital requirements due to holding of larger inventories due to uncertainty and delays

(2) Indirect taxes.
   (a) Higher rates to counter inadequate direct tax collections
   (b) Effective rates due to cascading effects.

(3) Interest costs.
   (a) Due to borrowings by industry from informal markets.
   (b) Due to government's (and public sector's) growing need for borrowed funds and increases in interest rates offered by it, raising the floor of interest rates.

(1) The increase in the transactions costs would be of the order of 40 per cent, roughly the size of the black economy

(2) Assuming revenue neutrality, that is, if direct taxes were paid, how much would indirect taxes be less by (an exercise carried out in Kumar and Sen (1993)). On this basis, indirect taxes add 25 per cent to costs

(3) Assuming that, if direct tax collection was adequate, government's borrowing requirements would have been at the level in the 1970s and interest rates would have been close to the LIBOR (say 10 per cent) and assuming informal market rates to be at least 24 per cent and the formal market rates to be 18 per cent, the interest cost would be higher by 10 per cent.

In effect, the cost of production of organised industry in India in 1990-91 was higher by around 75 per cent due to the existence of the black economy. These extra costs are a result of the waste involved in production and the extra profits accruing to the propertied classes.

it borrows.[13] This raises the floor of rates of return available in the economy. The effect is a rising share of profits in the national income and a profit inflation. It also implies that over time, the cost of borrowing to the state and the interest burden(I) rise.

The state is forced to pre-empt banking resources through a rising SLR and imposing social sector obligations on the banks. To maintain a semblance of profitability of the banking sector, the government had to allow banks to charge a higher rate of interest from non-priority clients and this further raised the floor rates.

The actual budgetary magnitudes incorporate the effect of the black economy, hence no separate term need to be introduced in eq 2. The interest burden I rises with a time lag. The effect of the black economy on the budget is that instead of showing a primary fiscal surplus there is a deficit. Profits of the private sector rise by the amount of transfers from the public sector and swell undeclared profits. As shown below no rise in demand is associated with such transfers even though the fiscal deficit rises. (However, prices may rise due to increase in costs.)

Black Economy and the External Sector

As pointed out above, due to smuggling in of gold, silver, gems, electronic goods, etc, and due to flight of capital abroad, the national economy loses foreign exchange. The foreign exchange for these activities is raised through (a) the havala market which in turn taps Indians abroad wanting to send remittances back to India and (b) exporters and importers indulging in under- and over-invoicing, respectively. Drug smugglers whose profits accrue abroad (estimated to be Rs 20,000 crore in 1990-91) also use this channel to send some of their money back to the country.

Out of the proceeds accruing to Indian nationals outside, a part is invested there. This is an unavoidable loss of savings and should not be counted as part of the black economy savings. Another part, which Indian nationals want to send to their families or business in India comes through the havala channel. Those needing funds outside the country take them there while paying from their rupee funds in India those for whom the transfers were meant. This involves leakage of savings of those sending their funds outside. Those receiving funds in India may save a part of it and consume the rest. This is no different from what such individuals would have done, had they received the funds through the official channels, hence leaving the savings-investment pattern of the black economy unchanged and as captured in the remaining six channels.

The third part of these accruals outside may be used to smuggle in goods. Precious metals and gems are largely smuggled in to be held as assets, they represent a transfer of savings out of the economy and are like a capital account transaction. Smuggling of other goods increases consumption in the economy at the expense of savings.

Indian nationals holding assets abroad, purchased from savings siphoned out of India, earn a return on them This should have accrued to the Indian economy through invisibles These proceeds are lost to the national economy and result in lower official remittances and a larger official current account deficit.

In brief, there are four kinds of effects on the national economy due to the black transactions in the external sector. First, the implication for reserves and money supply. Remittances which do not flow into the country through official channels imply that foreign exchange does not accrue to the RBI and corresponding funds are not released in the economy. Secondly, for national savings. Not only is the flow of savings of Indians abroad reduced but savings in the national economy either leak out through this route or are lowered through increased consumption.

Thirdly, for the current account. Exports are larger by the extent of under-invoicing while imports are larger by the extent of smuggling and under-invoicing but smaller by the extent of over-invoicing. In the net, the true deficit in the trade account (not counting drug traffic) is lower than indicated by official data and current account of the true economy is in surplus (Appendix 3). Finally, private holdings of assets abroad or gold held in the country does not help the official reserves or the BOP situation.

Given the above, in eq 2, the true X – M term needs to be split up into its black and white components with the latter reflecting the official data and the former the remaining part. The economy's BOP situation continues to be reflected by the official data with its growing dependence on inflow of capital (FDI, FII) through official channels

V
National Income Identity with a Black Economy Component

In the light of the above discussion, the national income identity, as given in eq 2 above, needs to be modified as follows:

$$(P_{pw} - T_p) + P_{pb} + I = I_{pw} + I_{pb} + C_e + [\text{Budget Deficit} + B] + (X - M)_w + (X - M)_b \quad ...3$$

Fiscal Deficit = [Budget Deficit + B] is given by the budget.

BOP implications are given by the white component of (X – M) but the capital flows are given by the true (X – M).

This identity can now be used to analyse the implications of policy for output, prices, BOP, fiscal deficit and other variables. Incomes and expenditures are a part of a circular flow and the presence of the black economy alters the pattern of flows as compared to what would prevail if there was only a white economy, thus, changing the determination of prices and output in the economy.

Direction of Causation

In eq 2 and the identity given in Kumar (1988a) the causation runs as in Keynesian models from the right to the left. The elements on the RHS can be taken to be given at the start of the short period.[14] The budget deficit is the resultant of various expenditure and revenue decisions and not independently given – it is fixed by the budget, ex-ante. Distribution in the model is also assumed given for the short period so that once the level of gross profits is obtained, the level of output is determined. If there is no capacity constraint in the economy, any change in output would be in real terms otherwise in nominal terms.

The above model with the black sector (eq 3) is also assumed to work in the same way. The assumption is that the share of black economy in the total economy (which is rising) is fixed at the start of the period. Thus, distribution remains unchanged during the period. The budget deficit gets fixed at the start of the period by the government's budget and the black economy. Black investments and consumption are taken to be determined in the same way as are their white counterparts [Kalecki 1971] only the parameters differ In effect, *the causation can still be assumed to run from the right to the left* with the elements on the RHS given at the start of the short period. Using comparative statistics, the following results can be obtained if the share of the black economy is allowed to rise and/or fiscal policies changed.

Tax Evasion and Budget

(1) Evasion of direct taxes means an increase in P_{pb} at the expense of P_{pw} and a decline in T_p so the left hand side (LHS) becomes larger. The right hand side (RHS) also increases by the same amount due to a rise in the budget deficit. Hence even though the disposable income of the

capitalists rises due to an increase in undeclared profits and reduced tax payments, there is no effect on output since gross profits remain unchanged. However, if the government keeps the deficit unchanged by reducing expenditures, the RHS will be unchanged. In this situation, the LHS also has to remain unchanged so that the gross profits will have to decrease by the amount of tax evasion. Decline in gross proifts will be through a reduction in production. Hence, *ceteris paribus, increase in direct tax evasion will cause production to fall.*

When indirect taxes are evaded, direct taxes are also evaded on the additional income. Black profits rise by the amount of value of output on which indirect taxes are evaded so that the LHS of eq 3 rises. On the RHS, the budget deficit rises by the amount of direct and indirect tax evaded, i e, by an amount smaller than the LHS. Hence gross profits have to fall through a decrease in production. Firms paying less of indirect taxes could be expected to lower prices but this is unlikely since the object of evasion is increased profits and not lower prices. If the budget deficit is held unchanged, through reduction in expenditures, the drop in output would be even sharper. In brief, *ceteris paribus, an increase in indirect tax evasion causes a drop in output.*

If, in the face of tax evasion (direct or indirect), indirect taxes are raised to keep the budget deficit unchanged, RHS remains unchanged and so will gross profits and output. However, since indirect taxes are prime costs in production, prices would tend to rise. Clearly, the economy faces stagflation. *Hence, an increase in tax evasion is stagflationary even if accompanied by a rising fiscal deficit or a rising share of indirect taxes to prevent the budget deficit from rising.*

(2) The fiscal deficit is the sum of the budget deficit and net borrowings (B). *B is only a means of financing the fiscal deficit (and does not change its size) so that there is no impact on gross profits or the output* in the economy. However, if government expenditures increase in spite of the loss of revenue due to tax evasion, the fiscal deficit rises and creates additional markets. On the LHS the gross profits P_{pw} rise due to expansion of output.

However, if in the effort to raise B, interest rates rise, total interest payments I rise in subsequent periods. *Ceteris paribus,* the budget deficit will tend to rise by the same amount on the LHS, raising the fiscal deficit. Thus, in eq 3 both sides remain balanced and there would be no impact on gross profits or output.

If government expenditure increases while tax revenue is held in check by the black economy, the fiscal deficit rises and has to be financed by a rising B and with a time lag an increase in I which further raises the fiscal deficit. This raises the spectre of debt trap which eventually forces a cut back in the rate of growth of expenditures to keep the fiscal deficit in check.

(3) The black incomes generated through the public sector lead to an increase in the fiscal deficit on the RHS and also an equal increase on the LHS in the P_{pb}. This is a pure transfer of profits from the public sector to the private. No expansion of the market occurs. However, if the government cuts other expenditures (like, investments) to check the rising deficit, then P_p would fall by a like amount and output falls.

Subsidies from the budget raise the budget deficit (RHS) and lower prices. If they accrue to the propertied classes then the level of profits (LHS) rise and output is unaffected. For instance, this is the case with export subsidies, fertiliser subsidy, subsidised services for the well off and the subsidies meant for the poor but skimmed off by the propertied. If subsidies go to labour, the fiscal deficit (RHS) rises without a change in P_p (LHS). Since the workers consume all of this income, the level of output increases and so do P_p (LHS) (bringing eq 3 into balance).

As public sector profits are skimmed off, its balance sheet profitability falls while the fiscal deficit and black profits rise (while output remains unchanged, as argued above). To keep the fiscal deficit in check, government has cut back budgetary support to the public sector and forced it to borrow outside the budget. This device while lowering the government's fiscal deficit does not reduce the entire public sector's deficit. The costs to the public sector rise due to higher interest charges. Consequently, either administered prices have to be raised to cover higher costs or the public sector surpluses decline and the fiscal deficit rises.

The above discussion leads to the following propositions.[15] These are in a ceteris paribus sense holding other variables unchanged.

(1) An increase in the level of budget deficit (holding evasion unchanged) leads to an increase in the level of fiscal deficit and causes an increase in P_p and the level of nominal output.
(2) As evasion of taxex (direct or indirect) rises, P_{pb} increase. Evasion of indirect taxes also results in dodging of direct taxes. With tax evasion, the level of output falls while prices remain unchanged. Government's capacity to increase demand in the economy, through an increase in the fiscal deficit, is truncated.
(3) In response to tax evasion, if direct tax rates are reduced while indirect tax rates are raised (to keep the budget deficit unchanged), resulting in a fall both in the amount and the share of direct taxes in total tax collections, the P_p and the level of output fall while prices rise. In other words, the situation becomes stagflationary.
(4) Increased net borrowings to finance the fiscal deficit do not cause a change in the level of P_p or output. They enable expenditures to rise and the fiscal deficit to increase. However, subsequently, the revenue deficit and the interest burden on the budget rise. An increase in the fiscal deficit due to an increase in interest payment does not lead to any rise in the level of output. Thus, it is the primary fiscal deficit (fiscal deficit – interest payment) which generates demand. Rising borrowings pose the threat of a debt trap and, therefore, serve a limited role in raising demand in the economy and beyond a point become counterproductive.
(5) Subsidies raise the fiscal deficit but lower specific prices. If they accrue to the propertied, the level of output does not change. If they accrue to the wage earners, output rises.
(6) Transfers from the public sector to the private sector on account of corruption increase the fiscal deficit and the gross black profits without leading to output increases. This may result in increased borrowing by the public sector and an increase in the interest burden and a subsequent rise in the fiscal deficit. While output does not increase in this process, administered prices may rise, leading to a higher level of inflation.
(7) The fiscal deficit rises in response to the growing share of black economy because of (a) the lower buoyancy of taxes, (b) illegal transfers from the public sector, (c) increased burden of interest payments and (d) increased expenditures on subsidies, law and order, etc. Since most of them have no impact on output, the role of fiscal deficit in raising the level of output declines with the growing share of the black economy.

Impact of Black Investments

An increase in I_{pb} in eq 3, raises RHS so that the level of P_p (LHS) has to increase through an increase in output.

(1) Under invoiced inventories lead to the rise in the actual investment in the economy but through the black channel. This leads to a rise in P_{pb} and the level of output. However, if inventories rise at a rate faster than that of output, profitability declines and the purpose of generating black incomes is defeated so that it cannot be a significant activity (Appendix 1). Increase in cash balances though small will force interest rates to rise and lower the level of output.

(2) Over invoiced plant and equipment implies that I_w is over stated. In effect, I_b is negative while P_{pb} rises by this amount. P_{pw} should be higher by the amount of over invoicing due to the higher declared I_w. Hence, while the RHS is unchanged, the LHS appears to rise by twice the over invoicing. This requires P_{pw} to fall from its apparent level by twice the amount of such over invoicing. The level of output is correspondingly affected and the multiplier has a negative value. This aspect is countered by under invoiced investments which increases I_b.

(3) Flows into the informal sector and white savings lead to an increase in investments since unfulfilled projects can be funded. Thus, P_p and output rise. A part of these funds flow into speculative channels but this does not lead to a rise in the level of investment

(4) Holdings of precious metals, etc, and flight of capital imply a leakage of savings from the economy. Investments are made outside so that output or gross profit do not rise within the national economy. However, there is an effect through the current account surplus which is dealt with in the next sub-section.

(5) Investments in transfer activities. The black profits do not rise unless they lead to larger consumption or investment. But that is dependent on other aspects of the economy and taken care of by other variables in eq 3. It results in an increase in the transactions velocity of money and a decrease in its income velocity. It could result in higher investments in other black channels but does not due to the relative rates of returns being lower in those activities.

(6) Investments in illegal activities raise the level of output in the economy. P_{pb} increase but a major portion of it accrues outside the economy and promotes criminalisation of society.

In a nutshell, while the savings rate out of black incomes is likely to be much higher than that of the white economy, the investment rate is likely to be lower since many components of black investments are either transfers or leakages from the national economy. Hence *black investments tend to (a) lower the rate of growth of the economy as compared to what it could have been and (b) cause a worsening in the BOP*. The reason why the rate of growth of black incomes remains higher than of white incomes is that the former is not generated out of black investments alone. A part of the output from white investments is not declared and generate a major chunk of the black incomes.

Black Economy and BOP

As already argued, the functioning of the black economy results in a lower true trade deficit, a current account surplus rather than a deficit and outflow of private capital rather than an inflow. However, what is relevant to the BOP situation is the official current account deficit. The current account surplus (instead of deficit) implies a *higher level of output and of gross black profits*

Increase in black investments (in real estate, gold, gems, capital held abroad) and black consumption (consumer durables, foreign vacations, etc) lead to *increased demand for foreign exchange, worsen the BOP situation and lead to pressures for the devaluation of* the currency.

Investments outside the national economy are matched by a rise in the current account surplus and since these are linked to illegal activities, they raise P_{pb} outside the economy with no impact on output in the economy. Hence, in comparison to the situation where these investments had occurred in the economy, *the rate of growth of the economy and its employment potential decline*. The adverse BOP situation this creates lowers the economy's capacity to import essentials and its rate of growth. It slows down the rise in productivity in the economy.

An increase in the *capitalist consumption* causes P_p and output to rise. However, since its import intensity is higher, it adversely affects the trade account and reduces the rise in P_p.

In brief, the impact of the black economy on the external sector through C_c, I_b and the current account causes P_p and output to rise while the BOP situation worsens. This last poses difficulties for the white sector and since a large part of the P_{pb} associated with these activities accrue outside, the benefit to the national economy is reduced. Finally, since a major part of this activity is also illegal, like, drugs, smuggling, etc, it poses additional problems for the national economy through criminalisation and increases in expenditures on law and order.

VI
Black Economy: Larger Macro Aspects

The repeated failure of economists to come up with plausible explanations of the Indian macro-economy based solely on the analysis of the white economy should have made them look for other explanations. But, given the complexity of most economic phenomenon, partial explanations go a long way and specially if there is a ruling ideology pushing ahead regardless.[16] The Left economists have ignored the black economy, in spite of mounting evidence that it had become significant in the 1970s itself. Even though for them policy was critical and its failure evident they could not see the link between policy failure and the growing share of the black economy since it was not a part of their framework.

Analysts from the Right used the fact of a growing black economy to discredit state intervention in the economy and used policy failure to attack the pro-poor orientation (at least on paper) of policies as populism.[17] They turned the logic of the black economy around. Rather than see the rising share of black economy and the consequent rise in the share of property incomes as the cause of policy failure, they depict state intervention as the cause of the black economy and economic failure. The international trends since the 1970s – namely, the rise of Reganism and Thatcherism, the decline of the Soviet system and the growing dominance of the IMF and the World Bank over the third world were pushing this line of thinking

The economists from the Right do not analyse the black economy in a macro context but formulate issues pertaining to it in micro terms, usually resorting to optimisation under given constraints and focusing on individual behaviour.[18] Income is taken to be given and its dependence on expenditures and output as is clear from equation 3 above, is ignored

Tax evasion is by a class of people affecting expenditures both by them and the government. Thus, there are implications for the incomes of the class itself It is then erroneous to isolate an individual to study his/her tax behaviour. Further, tax evasion raises the share of profits in output so that there are distributional consequences which affect demand and incomes as shown by equation 3 and analysed above Thus, there are consequences of tax evasion not only for an individual belonging to the tax evading class but also for the social welfare of that group, an issue which the micro literature does not address.

For instance, this literature fails to realise that the black economy hurts the interest of capital the most – as shown above, markets stagnate and slow down growth. Since budgetary expenditures are predominantly in the interests of the propertied, as the state loses its capability, they lose the most. Inadequacy of law and order, education, health, rural infrastructure, power, transportation and telecommunications hurt the interest of capital more than that of labour (or the poor).

Due to the rising share of the black economy, the policy-maker has lost control over the flows of capital within the economy and its leakage outside. Not only does the share of capital in national income rise, it has become a channel for its further expansion through obtaining more concessions. This limits resource mobilisation by the government and forces it to borrow from the propertied classes themselves. Since they can choose between the black and the white economies, they extract further concessions from the government to lend to it [Kumar 1988a]. To make interest rates competitive with the returns available in the black economy, tax concessions have had to be granted to attract capital into socially desirable areas thereby raising the share of capital in income.

The black economy forces the government to borrow more at rising interest rates and to raise indirect tax collections thereby raising cost of production in the economy (Appendix 4). This could have been avoided if resources could have been raised through direct taxes since they are not a prime cost and do not enter the pricing formula of firms. In effect, *dependence on direct taxes for revenue would have insulated the production structures from the inefficiency of the system* caused by the growing black economy.

Finally, the leakage of black profits from the economy and their investment abroad is like having capital account convertibility. *Indian capital has become internationalised through this route.* Mobility has thwarted policy and become another mechanism for extracting concessions. Internationally also, greater mobility of capital has strengthened it against labour. This is apart from the fact that trade union strength has fallen in most countries of the world. Capital mobility has forced nations to make competitive concessions and raise the share of capital in output worldwide.

In a nutshell, tax evasion is a macro issue and not a micro one. For instance, by itself, it does not lead to an increase in P_p though individual capitalists may feel so. The growth of the black economy leads to a rise in the share of capital in national income *through primitive accumulation of capital.* This occurs directly through an increase in gross black profits and indirectly through obtaining concessions. However, for national capital this route to raise its share is inefficient since it reduces the growth impulses in the economy, raises costs of production, creates a BOP difficulty and leads to policy failure and reduced effectiveness of the state. The failure of policy has not remained confined to the economic sphere. The authority of the state has weakened, illegality has grown and their effects visible in the social and cultural spheres. These aspects of the consequences of a growing black economy can be used to understand more fully the developments in the Indian economy since the 1970s.

VII
Analysis of Growing Crisis since 1970s

Stylised Facts of 1970s and 1980s

The crisis in the Indian economy in 1991 did not materialise suddenly and had its roots going back to at least the early 1970s. So to analyse this crisis, it is important to take into account the behaviour of the key macro variables of the Indian economy in the 1970s and the 1980s. But as pointed out earlier, the black part of the variables also have to be taken into account.

Data from the white economy indicate that the rate of growth of output fluctuated through this period. It was higher on the average after the mid-1970s than up to then. The wholesale price index fluctuated sharply during the period and the average climbed through the 1980s and into the 1990s. Thus, nominal GDP grew at a consistently high rate through the period. Employment generation decelerated through the 1980s, specially in the organised sector. The unorganised sector data are unreliable but indications of a decline are available. These variables discussed so far are linked to the LHS of equation 3 and depend on the independent macro variables on the RHS.

The following variables increased faster than the GDP. Indirect taxes, borrowings of the public sector, deficit financing, fiscal deficit, subsidies, interest burden on the budget, exports and imports. The ratio of trade deficit to GDP increased up to the early 1980s and then declined. The ratio of direct taxes to GDP rose up to the mid-1970s and then declined. Gross domestic savings and capital formation rose through the 1970s, declined up to the mid-1980s and again rose. The gap between the two however rose, indicating capital inflow from abroad. The availability of consumer durables rose through the period and specially after the early 1980s when many new goods hitherto unavailable were introduced into Indian markets.

Data from the black economy indicate a growing ratio of black economy to the white economy. Flight of capital, smuggling (of gold, silver, gems, synthetics and electronics) and under-invoicing and over-invoicing of exports and imports all grew in magnitude. While gross black profits rose, due to leakage from the national economy, the investment ratio in the black economy was much less than for the white economy.

Implications of Stylised Facts

Many of the above mentioned trends in the white part of the independent macro variables are a consequence of the growing share of black incomes in the economy. The growing share of the black economy implies a rise in the share of P_{pb} to P_p and of P_p in national income. *Ceteris paribus*, this implies an increase in the degree of monopoly in the economy. Proposition 3 of equation 3 is applicable in this case and suggests a tendency towards stagflation in the economy.

The private sector which cannot on its own check the growth of the black economy found itself hamstrung in raising the rate of growth of output in the economy. A rise in C_c and in the current account surplus helps in boosting demand but the former is small and the latter linked to illegal activities hence with little linkage with the white economy. Higher P_p did not lead to a *corresponding* rise in investments since they leaked out of the economy or were diverted to transfer activities.

Growth impulses from the private sector remained weak in spite of the rising degree of monopoly in the economy. The investment process weakened in the private sector with funds diverted into unproductive channels where the rates of return were high due to tax evasion, like, in the secondary share market, real estate, hoarding, etc. Rural surpluses instead of being reinvested flowed into real estate speculation, holding of gold, etc. As already discussed, these are transfers with little impact on production.[19] The black economy by diverting investments away from productive into unproductive channels has slowed down the growth impetus of the private sector.

The ratio of white private investments to GDP stagnated. While data show that the share of property income and savings in national income rose, leakages from the national economy prevented the share of

white savings in the economy from rising in the 1980s. As already argued, the black investments have not enabled the share of investments in the economy to rise. Consequently, since the last 1970s growth became critically dependent on the growing fiscal deficit.

The government did try to raise the rate of growth by increasing the primary fiscal deficit. In the 1980s, the rising fiscal deficit helped increase demand and the rate of growth of the economy. But as the black economy grew, the logic of propositions 4, 5 and 6 came into play and limited the role of fiscal deficit. To recapitulate, the growing share of the black economy reduced the buoyancy of direct taxes and forced increases in indirect taxes and borrowings. The interest burden on the budget rose and the primary fiscal deficit stagnated even though the fiscal deficit continued to grow and the growth impulse petered out.

The employment coefficient of black expenditures is low except in illegal activities. Even black consumption tends to be of the hi-tech variety and is capital-intensive like, in luxury tourism, hotels and restaurants, other professions, etc. Consequently, the multiplier associated with the black economy has been small.

Moderate real rates of growth, coupled with declining employment coefficients in the white and the black investments led to a growing problem of un- and under-employment right through the 1980s. The burden of employment generation fell on the residual unorganised sector with low paid jobs. This could not fulfil the expectations of the rising number of degree holders and manifested itself in the rising tide of social discontent and their turning towards illegal activities which the black economy was in any case promoting. The black economy worked from both the supply and demand side to catch unemployed youth in its grip.

The rise in the rates of return in the economy and the rising share of the indirect taxes in the economy reflected themselves in the high cost economy and a general inflationary pressure. They led to a rise in the subsidies in the economy and where producers were not able to pass on cost increases as in the case of the public sector, industries with stagnant demand and the small-scale sector, there was growing sickness. Subsidies are of two kinds (proposition 5) and are associated with political elements.

First, subsidies which were genuinely required by those (the non-propertied) whose real income generation had stagnated and their capacity to pay full cost of food, infrastructure, etc, had declined. Subsidies were also required in urban areas if cities were not to totally breakdown because the bulk of the population was unable to pay full cost of services.[20] Secondly, subsidies were enjoyed by the well-off sections of society who provided themselves implicit subsidies (Rs 6,000 per person in Delhi in the late 1980s). In many cases, subsidies for the non-propertied were also appropriated by the propertied.[21] This cannot be an argument for ending subsidies for the poor.

The public sector is full of inefficiencies and corruption. The public sector has been used by those in power to build personal fiefdoms and is at the root of political and bureaucratic interference. It is also responsible for the demoralisation of the workforce of the public sector and its lack of commitment to the idea of the public sector. The budgetary subsidies to the public sector have benefited the propertied through availability of cheap infrastructure. However, this is unsustainable since it led to the budgetary crisis and sickness in the public sector.

Certain subsidies to the propertied appear to be legitimate. They are the result of rising costs as in the case of exports and fertilisers. To keep inflation in check, food price increase had to be moderated which required subsidies for inputs into agriculture. In brief, the increasing ratio of subsidies to GDP raised the ratio of fiscal deficit to GDP and kept prices in check. However, since a growing proportion of subsidies were cornered by the propertied, it did not cause a commensurate increase in the growth of output (proposition 6).

In brief, the rising share of the black economy has in one way or the other affected the trends in all the independent macro variables and hence the dependent variables. It explains the relatively slow rate of growth of the economy in the 1970s and the 1980s in spite of the rising ratio of fiscal deficit to GDP. The growing budgetary crisis and the eventual petering out of the growth impulses in the economy in the late 1980s, the worsening BOP situation, the rising costs of production and growing inflationary potential are its consequence. These trends aggravated unemployment and along with growth in illegal activities led to growing criminalisation and breakdown of cities. The private sector finding an easy route to higher profits did not need to take risks in development of technology. With public sector sickness and limitations in imports of essential technology due to BOP problems, technological dynamism of the economy further slackened in the 1970s and the 1980s.[22] The period is characterised by widespread policy failure.

VIII
NEP and Black Economy

As argued in Sections I and II, NEP attempt to generate supply side responses in the economy. They hope to play that role in the white economy which capitalists had been achieving through the black economy – namely, raise the share of P_p in national income. A wide variety of concessions have been granted to capital. State is supposed to retreat through privatisation of the public sector, cuts in subsidies to 'get the prices right', downgrading of planning and the unshackling of the market forces. A reduction in the budgetary transfers to the non-propertied has been implemented by cutting subsidies meant for them. Concessions, like, lowering of tariffs and taxes, devaluation, dilution of FERA have been granted to foreign capital to attract technology.

A reduction in the fiscal deficit while cutting direct taxes and customs duties is the surest way to force reduction in expenditures to limit the role of state in the economy. The *black economy is sought to be curbed by legalising certain activities* but new opportunities seem to have opened up to generate black incomes. Quantitative restrictions on imports have been almost eliminated so that what was smuggling earlier has become importation. Tax concessions are being granted to retain national capital within the national economy and NRIs are being encouraged to bring in capital. A part of this is capital formerly taken out of the country.

These changes have converted a part of P_{pn} into P_{pw}. These would accrue within the national economy. Corresponding black investments abroad may decline. However, loss of foreign exchange has continued since the quantum of these legalised activities has grown.[23] Thus, the true trade account is adversely affected and lowers P_p. With the cheapening of foreign goods, capitalist consumption has risen, again adversely affecting the trade deficit. In brief, the growth impulses emanating from the external sector and the public sector have weakened under NEP.

Since tax rates have come down sharply and controls are less, some have argued that the size of the black economy would have declined. This is not borne out by a listing of the major scandals exposed in the national press between 1956 and 1996. The amounts involved have grown exponentially when the 1990s are compared to the 1980s. The biggest scam of the 1980s was Bofors involving a sum of

Rs 65 crore but there were at least a dozen scams involving larger sums in the 1990s. The largest being the securities scam involving Rs 3,000 crore. The number of scams reported in the 1980s was 13 while the number for the 1990s till 1996 was 26. This is not just a matter of more vigilant media.

What the above suggests is that the black economy measured as a share of the white economy has not diminished and most likely grown even if some activities have gone out of its ambit.[24] The large-scale expansion of the tertiary sector in spite of a reduction in the scale of operations of the government has been based on increase in speculative activities [Kumar 1996b] which lend themselves to black income generation. Part of the growth of the economy is a result of government propaganda to show the success of NEP but a part is based on the declaration of formerly undeclared output [Kumar 1996a].

In brief, the decline of governmental regulation, increases in the scale and size of corruption, the newer opportunities to businesses, increase in speculative activities and growth in the tertiary sector where the black economy is concentrated suggest that the black economy has continued to grow. Even the evidence that buoyancy of direct tax has gone up is not an evidence of better compliance but reflects more skewed income distribution [Kumar 1994a and 1995]. The problems originating from the black economy prior to 1991 have, therefore, continued. These are compounded by the trends from the public sector and the external sector.

The burden of growth then falls on increasing white investments. But, this is unlikely to happen with excess capacity in many sectors. The decrease in black investments abroad do not lead to white investments. On the whole then demand would tend to decline and lower P_p. Black profits would not entirely reappear as white profits as the economy slows down. *The paradox is that an attempt to raise the share of profits in national income leads to a fall in the level of gross profits.*

As already pointed out, it is not that the share of P_p in the economy was not rising in the 1970s and the 1980s. Its further rise due to NEP is only accentuating the problems already being faced during the earlier period – the markets can only narrow further. With slow demand growth, private investments, Indian or foreign, cannot be buoyant.

Supply side responses expected by NEP can only occur with a time lag [Kumar 1994a] provided investments rise and technology improves. If this is based on import of capital goods, current account deficit will widen by an equal amount and the market size would not change. Demand would further decline if projects that could be internally set up are based on imports. Foreign investment has affected Indian investment [Kumar 1994a] by posing a threat and is hardly the solution unless it comes on an unprecedented scale in spite of slow down. But then, it would have to be export-oriented. There are few signs of this at present.

Internationalisation of Indian capital has gone a step further through the opening up of the Indian markets and the liberalisation of terms and conditions for MNCs bringing in capital and the consequent shake out taking place in the Indian capital markets. MNCs have teamed up with Indian big business (junior partners). Without bringing in much capital they can control Indian capital through their financial clout, technology, marketing, brand names, etc.

Indian national capital by supporting NEP has displayed short-sightedness. The increased share of profits in national income post-1991 has mostly accrued to MNC capital and the narrowing of the home markets has meant that indigenous capital has weakened with respect to the MNCs. Indian capital can expand at the expense of the smaller units of capital – the small and the medium sectors but this would be inadequate to counter the challenge of MNCs. The situation is just ripe for the MNCs to absorb their junior partners – the Indian collaborators.

With slow down in industry and rupee proceeds accruing to former smugglers, there has been a rise in speculative activity – in the foreign exchange market, secondary share market, real estate and goods in short supply. These are transfer activities and do not count but they can fuel flight of capital if a rising current account deficit on the white account leads to devaluation increasing the rates of return on holdings of foreign exchange and gold.

NEP has introduced cost push elements in the Indian economy. Getting prices right meant profit inflation, increases in administered prices and cuts in subsidies. Devaluation has led to imported inflation. Prices have risen in spite of reductions in the rates of customs duties and cuts in excise duties on luxuries.

Prices of certain white goods, like, autos, computers and CTVs have declined but this does not affect the general price level. Even if there is an expansion in demand for white goods, given the high import intensity, the impact on industrial growth would be low but imports would rise. Cheapening of capital goods will not affect the price level for several years. It may, however, upgrade technology and help exports through quality improvements. Clearly, even if this occurs, imports will rise before exports and the current account deficit will worsen. Finally, exports may still not rise if the international economy slows down.

In brief, under NEP, the size of the black economy has continued to grow in spite of the legalisation of certain formerly illegal activities. This is due to the easing of the business environment and the availability of opportunities for not declaring profits. The pre-1991 trend for an increase in the share of profits and internationalisation of the economy has continued. Inflationary pressures have continued, the true current account surplus has declined resulting in a creeping devaluation which has encouraged flight of capital and holding of gold and foreign exchange. To counter this, the government may have to impose curbs on imports or to allow further devaluation. To counter inflation, internal demand has had to be curtailed and fiscal deficit cut through a reduction in expenditures. A tight credit policy and high interest rates has become necessary. All this would slow down growth in demand and output. With opening up, the Indian policy-makers have lost their capacity to solve certain key internal economic problems. *Policy failure is substituted by absence of policy in these areas.*

IX
Conclusion

The major macro-economic problems of the 1970s and the 1980s were integrally linked to the growing phenomenon of black income generation. It should have been a significant factor of analysis of the Indian economy. Its non-inclusion in analysis resulted in a partial understanding of the Indian economy and often to incorrect policy pronouncements.

This paper describes the institutional practices of the black economy and incorporates it into the short run macro-analysis of the Indian economy. The need to incorporate the black economy is not simply an empirical matter but a theoretical necessity. The circular flow of incomes changes with the black economy. Black incomes are first defined. Transfers are not included but their implications for national incomes, savings and velocity of circulation are presented. The theoretical analysis yields counter intuitive results with regard to tax evasion, investment and savings, subsidies, BOP, etc. The empirical

trends since the 1970s, say, with regard to unemployment, inflation, fiscal gap, current account deficit or investments and savings can be better explained using this framework.

Evasion of taxes and generation of black incomes leads to stagflationary conditions in the economy. Undeclared profits rise leading to a growing share of profits. The fiscal deficit grows but does not promote growth. The growing inefficiency of the system passes on to production so that costs rise fuelling inflation and reducing India's export competitiveness. The black economy leads to the fiscal crisis and erosion of the public sector's profitability due to the diversion of profits to private hands.

Capital used the black economy to raise its share in national income and created a contradiction for itself. It reduced its own capacity to grow rapidly (by narrowing its markets). While this made it more dependent on the state to generate demand in the economy, it also reduced the effectiveness of the state do to so – policy failure. It blunted its instruments for its own rapid growth for the sake of short-term gains.

NEP ignore the implications of the black economy. Many activities which were earlier illegal were legalised. However, this does not solve the problem since neither the growth impulses improve nor the leakages from the national economy decline. There may be some decrease in the transactions costs and the size of bureaucracy but by themselves they cannot be sufficient to speed up growth. Social waste has only grown.

Under NEP in spite of the decrease in tax rates and reductions in controls, the size of the black economy has continued to grow as indicated by rising corruption, growth in the tertiary sector and increase in speculative activity. The nature of the activities associated with the black economy (now or earlier) have to be changed and the income distribution implications of the black economy have to be tackled before a dent can be made on the basic problems of the economy. The NEP then do not constitute the solution to the country's basic problems. For the non-propertied who are told to wait patiently for their lot to improve, matters can only get worse.

The policy-maker is not willing to consider that in the last 50 years trickle down has been inadequate. In the 1980s, in spite of massive investments, the backlog of employment has grown. Government's difficulties in maintaining in real terms the expenditures on social sectors implies a worsening of the conditions of the non-propertied – those who are marginal to the market and need help from the state. But the state is in retreat.

NEP are changing the politics of the country. The coalition of the ruling groups in India has undergone a change with the inclusion of international capital and the marginalisation of the rural elite, the small businesses and the middle classes. Capitalist development under the tutelage of foreign capital is being attempted. This is 'globalisation' of the Indian economy, its internationalisation through legitimate means.

In a nutshell, that which is the corrective to the policies pursued before 1991 is also the corrective to the ills of the New Economic Policies. The black economy needs to be tackled head on and its more pernicious elements eliminated from the economy. Concessions to the propertied under NEP will not achieve this goal. They will have to change the basic nature of their economic activities. In this, the fiscal-monetary policy which governs the functioning of the major parts of the marketised economy can and will have to play a major role. The policy regime itself has to change from that which has existed in India. That is the real alternative before the nation -- an indigenous one based on the nation's own resources.

Notes

[This article is based on working paper no 11/93 of CESP, JNU. I am grateful to students and colleagues of the centre who have helped with comments. I alone am responsible for any errors that may remain. Thanks are due to Saumen Chattopadhyay and Nirupam Mehrotra for help with data.]

1 The Right economists have used the existence of the black economy to argue for reduced state intervention while the left economists have not linked it to the observed policy failure in the 1970s and the 1980s or to its implications for the nature of state intervention in the Indan context. For instance, Bhagwati and Srinivasan (1993) do not analyse the black economy and its consequences to understand the Indian economic crisis. Bardhan (1984) ignores this dimension in his analysis. How little understanding of the black economy goes into the recommendations of the influential Report of the Tax Reforms Committee is illustrated by the interchangeable use of the terms black money and black income [GOI 1991:33]. Chakravarty (1987) or articles in Byres (1997) analysing the Indian economy hardly refer to the black economy. There are rare analyses, like D'Souza (1992), which incorporate the black economy into the analysis of the Indian economy.

2 For the first time in post-independence India, the inadequacy of the trickle down associated with the current development process is being ignored. It is not being considered that the consequences of the market processes which are penetrating deeper into the economy and coercively involve the poor into the markets, require correctives through state intervention. This, in spite of the knowledge that the so called 'efficient' markets cannot on their own correct maldistribution.

Critics of NEP were also the critics of the policies pursued till 1991. Their case is not that we return to the pre-1991 policies [Kumar and Sen 1993]. They had argued that the country was heading towards a debt trap (internal and external), inequities were worsening, etc. The argument now is that NEP are even more viciously anti-poor. Critics are status quoists in the sense that they continue to demand an end to the anti poor bias in policies.

3 This is the way some of the critics of NEP have set out the macro-analysis of NEP. See for instance Rakshit (1991). Bacha (1990) is an example of use of a theoretical three gap model.

4 It is for this reason that Rakshit (1991) does not find any relationship between the three gaps when he uses the white data only even though it should have been identically so.

5 Chakravarty (1987) noted that there is a link between the low savings of the public sector and the rising savings of the household sector. He felt if the former is raised it may not lead to an increase in the overall savings propensity in the economy.

6 Data on the black economy are hard to come by and specially with regard to the external sector. However, data used here are based on talks with officials from customs intelligence and RBI. Partner country data analysis and figures for gold smuggling are fairly firm. Data on drug traffic profits are also supposed to be firm. Capital held abroad (say, in accounts) and diversion to havala markets are less firm but indications are available.

7 If the black economy is 40 per cent of the GDP at market prices then its current size would be about Rs 6,40,000 crore. If this could be brought into the tax net, it would result in additional income tax collection, at today's rates, of Rs 1,92,000 crore. This is more than double the current fiscal deficit and could result in lower indirect taxes and internal debt and more funds for the states and the plan. This is the real fiscal adjustment needed by the economy [Kumar and Sen 1993].

In contrast those who ignore the black economy in thier analysis can only suggest a reduction of the fiscal deficit by cuts in expenditures on the plan and the social sectors. They argue for reduced subsidies on food and fertilisers and the privatisation of the public sector without correcting the underlying causes of the rise in subsidies or the losses of the public sector. The debate enters blind alleys of prejudices.

8 Even in measuring the size of those components of the secondary sector where methods independent of the black economy are used like, input-output approach for the construction sector, if inputs are underestimates due to the existence of the black economy then the output would also be an underestimate.

9 Net capital inflow on the white account for the mid-1990s was around 2 per cent of GDP. It is conceivable that the private black hoards of capital held abroad may start to return under certain conditions and reverse the current actual outflow of capital.

10 There is a difficulty in how to treat the NRI remittances? Much of this may be flowing in through the havala markets as black. In this article these are being treated as household savings which should have come into the Indian economy but get transferred to those wanting to hold savings in foreign exchange outside the economy. NRI remittances have not kept pace with the number of Indians working outside or their rising incomes and it is likely that this has to do with the havala

markets. Further, increase in NRI deposits in spite of lucrative returns offered have been less than expected, reflecting diversion to other channels

11 Propensity to consume out of black incomes is supposed to be high. Yet, because these are high incomes, their consumption propensity is likely to be less than out of all white incomes. It is assumed here that one of the ways of consuming more out of black incomes would be to spend on status symbols like housing, cars, scooters and CTVs. In 1990-91, only 6 million individuals owned scooters or CTVs and only 1.5 million owned cars. If those with black incomes own at least a CTV then the number of families with substantial black incomes would be less than 6 million in 1990-91 out of 160 million families. In Kumar and Sen (1993) it was estimated that these families would have black income of at least Rs 3.5 lakh which is 50 times the national per capita income.

12 To the extent the black investments and the corresponding savings emanate from the real economy (black and white) with the associated factor incomes there are associated goods and services. If they are not utilised, during the period, they will accumulate as unsold inventories and would tend to dampen output.

The multiplier associated with black activity may also be smaller not only because of the higher black savings propensity but because of the institutional practices and the tendency of the black investments to leak out of the national economy.

13 If the cost of borrowing to the government is taken as the interest paid and the taxes foregone as concessions for such borrowing, then according to Sachdeva (1990), the cost of borrowing has risen from 7 per cent in 1971 to 22 per cent in 1987

14 This is the usual idea that expenditures govern output in the short run. All the terms on the RHS of eq 3 constitute expenditures or net injection of demand in the economy and the left hand constitutes income. The variables on the LHS are determined by longer-term factors but they cannot be written as functions of these variables for short term analysis since they are to be taken in the ex ante sense, and, therefore, not allowed to vary in the period. Hence imports and consumption cannot be written as functions of national income as it is done at times

15 Many other results can be derived [Kumar 1988a] but the ones given here are useful for the analysis in subsequent sections

16 Many economists make a false distinction between theory and empirical work. While this distinction makes some sense in natural sciences, it is hardly relevant to social sciences. Theorising has to refer to society as it is but, in economics, theorising is often based on mathematical models of one kind or the other, requiring abstraction which is not justified by anything more than what can be handled by the tool used. Much theorising is also concerned with the tool itself, independent of the subject matter to be analysed. Finally, even questions posed are often based on what can be answered by the available tools and not necessarily what needs answering. All these general propositions apply in the case of most of the available analysis of black economy.

17 See for instance, Bhagwati and Srinivasan (1975) or Ahluwalia (1985) or several official government reports written during the 1970s and the 1980s and espousing such analysis.

18 For instance, see the classic paper of Allingham and Sandmo (1972) or the paper on rent seeking by Kreuger (1974). Peacock and Shaw (1982) is an exception, since it deals with tax evasion as a macro issue but it ignores the fact that expenditures determine incomes and one should not mix up the two sides of the eq 3.

19 In fact, it was noticed in the 1992 stock market boom that capital raised by the private and the public sector in the primary markets was diverted into speculative activity in the secondary markets. The balance sheets of the private sector companies show this. Their profits in 1992-93 fell due to recession but their other income shot up.

20 Over 50 per cent of the populations of Calcutta, Bombay and Delhi live in slums in pitiful conditions in spite of the subsidies.

21 In the case of fertilisers, subsidies meant for farmers are paid to manufacturers. To gain more, costs are inflated by over invoicing capital. The government guaranteed 12 per cent rate of return on capital then results in higher subsidy and profits.

22 Additional problems arose out of failure to achieve fiscal decentralisation, growing concentrated urbanisation and the rising capital and energy intensity of the economy. Decline of the unorganised sectors and the small-scale in the economy, poor infrastructure in rural areas and lack of off-farm employment opportunities.

23 Inflow of gold in India was around 170 tonnes in 1990-91 but has risen to about 800 tonnes in 1998-99. Earlier only black savings were kept as gold but now even white savings flow into gold, encouraging an unproductive activity and leakage of foreign exchange.

24 Ades and Tella (1997) suggest that state intervention in industrial investment leads to corruption and a decline in investments. This is obviously not borne out in the Indian context in the post 1991 period where state's intervention in industry has sharply declined but corruption has not gone down. What is true is that where there is more corruption, more laws are broken. The issue is why is there greater illegality? This question is seldom addressed in the literature. Stiglitz (1989) addressing a different question suggests that there is much greater market failure in less developed countries (LDCs). What is being pointed out here is that the black economy is a major cause for such failure

Culturalism and Contemporary Right
Indian Bourgeoisie and Political Hindutva

Radhika Desai

The formation of a Hindu nationalist government in May 1998 at the crest of hindutva's recent electoral surge clearly testifies to the increasingly authoritarian urges of India's ruling class. Hindutva's chances of holding state power more securely lie in a more complete hegemonisation of this now overwhelmingly capitalist class. Hindutva pursues this political aim in part by adapting its hitherto excessively shrill and narrowly petty bourgeois ideology to the more settled nature, proclivities and imperatives of the ruling class. To this end it commands the resources of contemporary culturalism and neo-Gandhian discourse, must be seen as part of this broader effort to change and update hindutva.

OVER the last two decades, especially since the fall of communism, there has been a proliferation of discourses which claim to be progressive but whose political implications are actually questionable, if not outright conservative or reactionary. Culturalist discourses like postmodernism and post-structuralism have been particularly criticised by liberals as well as leftists and, more recently, linkages between certain strands of these and the emerging cultural politics of the right in the west have been drawn.[1]

The historical development of the right is governed less by the internal logic of its central theses (though some recurring themes can also be discerned[2]) and more by the exigencies of the times, by the tasks it is called upon to perform at given historical moments.[3] One should not be surprised, therefore, if similar conjunctures give rise to similar right-wing formations in many national contexts. This paper focuses on a writer, Ashis Nandy, in the main culturalist intellectual formation in India today, neo-Gandhianism. While the conservative possibilities embedded in the ideas of neo-Gandhian writers have also been noted,[4] this paper argues that, in the case of Ashis Nandy at least, there are far more serious and systematic complicities with the contemporary Indian right's cultural politics of hindutva ('Hindu-ness') or Hindu majoritarian nationalism.

Although, despite Nandy's claims to oppose hindutva, these complicities have not escaped critical attention,[5] their full extent cannot be registered as long as hindutva is viewed as a historically static ideological and political formation which is, moreover, unique to India. The formation of a Hindu nationalist government in May 1998 at the crest of hindutva's recent electoral surge clearly testified to the increasingly authoritarian urges of India's ruling class. However, this government was reliant on a ramshackle coalition with opportunist regional leaders and hindutva's chances of holding state power more securely lie in a more complete hegemonisation of this now overwhelmingly capitalist class. While its success will also depend on factors outside its control, hindutva pursues this political aim in part by adapting its hitherto excessively shrill and narrowly petty bourgeois ideology to the more ambitious and more settled nature, proclivities and imperatives of the ruling class. To this end it commands the resources of contemporary culturalism and Nandy's discourse must be seen as part of this broader effort to change and update hindutva. In this 'political hindutva' which Nandy is helping to build, Nandy's 'opposition' to hindutva are signals to reject elements of the received hindutva in favour of ideas which may be more acceptable and effective components of it in the present context. These may involve shifts in policy – witness, for example, the tensions within hindutva over swadeshi (national self-reliance) versus globalisation policies, or broader shifts in outlook. For example, much as the claim of contemporary European and American extreme right to 'oppose' racism actually signals its shift from biology to culture as the basis of the conception of difference and otherness. Although theoretically and methodologically sophisticated intellectuals would draw us into rarefied issues of theory and evidence and reveal, at best, only rather mediated political complicities and social moorings, with writers of less intellectual weight and more immediate political relevance like Nandy, they are clearly visible when set off against the dynamics of hindutva in the contemporary conjuncture.

While focused on India, a nation particularly disfavoured with national exceptionalism in scholarship both within and outside it, this discussion should arouse more general interest. The similarities in the dynamics of contemporary scholarly culturalism and its relation to the right across capitalist liberal democracies are sufficiently prominent and the particular insights the Indian case has to offer, sufficiently interesting. More importantly, perhaps, the general trends to which India is also subject, despite its formidable historical uniqueness, shed additional light on the character of political discourses emerging in it today. And it requires framing the discussion of Nandy in the Indian context in some general reflections.

Culturalism and Emerging Right

Periods of historical flux are inevitably accompanied by intellectual and political disorientation. The critical work of scrutinising the babble of emergent discourses in the context of the times, on the basis of reassessments of historical realities and possibilities, then becomes necessary for a new cartography of the political terrain to orient progressive politics. Insofar as the decline of left and progressive movements and thinking has been part of the present turbulence, they no longer mark much of the political terrain. But, it is hardly, for all that, featureless. In reorienting and regrouping under new imperatives of order, and with a significantly redefined constituency, the right has been staking out the political landscape. In retrospect it is clear that the late 1960s' worldwide economic slow-down – the first internationally synchronised recession in the history of capitalism – marked a convergence of political, economic, cultural and social trends across the capitalist liberal democracies although it was not immediately noted. By the 1980s, various national right formations were jointly and severally pursuing the agenda of economic liberalisation and then (primarily financial) globalisation as the favoured solution to economic slow-down. Proceeding slowly at first, picking up pace as self-confident New Right regimes held office in the 1980s, the processes set off by them unravelled

progressive regimes – enfeebled social democracies and developmentalisms and, finally by the 1990s, embattled communisms – which, thanks to preceding popular mobilisations, had been attempts to make the face of world capitalism more benign and humane for their respective populations.

With the decline in the power of non-capitalist elites on the one hand, and the left on the other, these common developments were rooted in the unalloyed reflexes, imperatives and interests of a broad swathe of business and professional upper and middle classes – the now more or less fully bourgeois ruling classes of each of these nations and their allies. Despite nearly three decades of accelerating integration and homogenisation, these bourgeoisies have not become a completely homogenous global capitalist class and it may be doubted that they ever will. They are, to begin with, differentially located in relation to each other in the single global hierarchy of economic power which came so plainly into view in the 1990s. Furthermore, they must continually negotiate their relationships with increasingly pressing global economic structures and other national capitals through the nation-state. They also differ in the weight and nature of the globalised and 'national' segments of capital (not to speak of other ways in which capital still fractures in each country) whose interests must also be mutually brokered. Finally, not only do the requirements of legitimation remain nationally specific, the intellectual and cultural resources available to these formations, and therefore the discourses they produce for all these purposes, are those which specific national histories have made available.

Yet, the political similarities are striking. Chief among them is the extent to which the staking and manipulation of cultural boundaries emerged , as so often in the past, as the right's favoured anti-materialist strategy. By the 1980s, after facing down waves of working class and peasant movements, they had been marching under the banners of economistic neo-liberalisms frequently aided, especially where the social bases for neo-liberalism were inadequate (as they so often were), by the international neo-liberalism of the World Bank, the IMF and International Financial Institutions. The early 1990s, however, the very moment of the triumph of the right over its ultimate enemy, communism, was also the moment when globalisation *per se* began attracting not only the beginnings of opposition of working people, but, perhaps to greater political effect, the ambiguity of significant sections of (especially the petty) propertied.[6] The neo-liberalism of the early New Right was never, in its economistic simplicities, an adequate hegemonic ideology. It could not speak to the non-economic lived experiences of people, nor deal with the experience of (global) market failure. In it s wake, the intellectual reconstitution of the right in widely different parts of the world began to feature certain forms of cultural discourses. They supplement and even obscure economic liberalism (without, however, opposing or rejecting it) to form more complete and hegemonic right ideologies based on particularistic cultural identity. As intriguing instance of this is the emergence, in the crisis-ridden post-Thatcherite British Conservative Party, of an intellectual strand which seeks to redeem and go beyond the primarily neo-liberal Thatcherite legacy by collapsing it into a specifically English nationalism.[7] (In a political conjuncture dominated by the right, parties formerly of the left, now in their new incarnations as the US Democratic Party style parties of capital also articulate such discourses only thinly veiled by different labels.) The deployment of the language of particularity, of cultural nationalism, in counterfeit answer to the accelerating universalisation of capitalism which it supports and promotes is the ingenuous reality of the right today.

While the reactionary character of these discourses of cultural identity in their starkest versions is not in doubt, apparently 'moderate' versions of the same ideas are widely accepted and indeed, regarded as progressive. The success of the right – never truly popular – has historically found such political disorientation useful. Today it can be traced in significant part to the spread of certain strands of scholarly culturalist discourses of various sorts – such as postmodernism, post-structuralist and cultural studies . Neither sufficiently responsive and accountable to scholarly/disciplinary standards nor moored in any movement for social change, by default they are oriented to the increasingly authoritarian cultural dynamics of the (largely middle and upper) classes to which they belong (not to mention the cultural apparatuses of increasingly repressive states into which they are progressively integrated).

Postmodernism and post-structuralism have faced plentiful, if largely academic, left criticism (because in the west, where they are most current, the academic world still boasts a left, however residual, in contrast to the political). Such criticism has varied in the degree of harshness with which it has inveighed against individual themes and writers but its chief targets were their general theoretical reliance on erroneous and politically reactionary philosophical tendencies, despite claims to intellectual rigour, and the political conservatism they consequently yield, despite avowals of radicalism.[8] The key lies, of course, in the rejection of reason and its potentials for critical political practice and universalism. The mystification of the dynamics of progressive social change is not confined to reducing the content of progressive concerns to the 'cultural'. They also reify (the now exclusively cultural) structures of domination as unchanging and unchangeable by collective human agency, thus making them the positivist parameters of a new 'realist' social theory. At the same time, political agency is itself debased by celebrating as 'resistance' – a bewildering range of ir- or a-rational acts and non-acts which neither identify nor change structures of domination. And they substitute a right for a left critique of universalism. The leftist critique of 'actually existing' universalisms charges them with being actually based on dominant cultural specificities, and therefore neither genuinely inclusive nor universal. It attempts, however, to move towards a more authentic universality which is the left's true vocation. This attempt is abandoned in favour of a convergence with the right's suspension of any striving towards universality which forms the deeply flawed basis of postmodernism's culturalist turn and the valorisation of cultural difference *per se*.

A small amount of more grounded criticism, with clear political implications, has pointed out, most obviously, that the displacement of the category of inequality by that of cultural difference is untenable, no proper substitute, "a silent abandonment of the analysis of capitalism as a global economic system".[9] But this argument implies that merely directing attention away from the material dynamics and unequal results of capitalism and towards 'frivolous' cultural matters successfully obscures the ills of capitalism. This overestimates the natural self-legitimising capacities of capitalism as a pure private-property-market economic system and underestimates the extent to which the manufacture and management of cultural difference and identity, so often the active ingredient in the right's politics of order, has historically served to stabilise capitalism.

Seemingly liberal multiculturalism, which progressives so often feel they can

ill-afford to criticise in the present political climate, feeds into this right-wing cultural politics. It is neither meant to nor actually succeeds in resolving the problems either inequality or difference.[10] Being set up to fail, as it were, it leaves the door open to an elite majoritarian backlash – right-wing populism. And it is not only the Le Pens and Pat Buchanans of this world who lead their silent majorities, opposed to 'vocal' minorities who get 'special treatment', through it. Such ideas, for example, the widespread anti-multiculturalist opposition to 'political correctness', are no longer the preserve of the extreme right and serve to create a pervasively authoritarian political climate. Now significant sections of the formerly 'progressive' intelligentsia rail against global 'cultural homogenisation' and champion the cause of particularistic cultures.[11] Others, often still avowedly 'progressive', lend scholarly support to these now frighteningly 'mainstream' arguments by reiterating the need for a certain basic level of cultural homogeneity in society for legitimate order even in democratic states, unmindful of the way in which this kind of discourse is primarily wielded against progressive movements as alien and destructive of essential cultural homogeneity.[12] Multiculturalism reveals itself increasingly as a form of enforced conformity to a superior, more 'liberal', culture, differing from assimilationism only in its focus on (small) 'difference' as opposed to the latter's insistence on (broad) homogeneity. In the absence of a left, politics in these countries oscillate narrowly between the 'soft' option of multiculturalism and a harder assimilationist cultural nationalism both of which regard cultural difference as irreducеable and deploy it as the chief, irrationalised weapon against 'homogenising' universal reason. Such convergence of the 'multiculturalist' and assimilationist positions is the true meaning of majoritarian hindutva's otherwise famously bewildering claim that India is secular and tolerant because it is Hindu and makes the Indian case especially revealing....

In general the defence of 'culture' is usually a defence of an existing distribution of material privilege – like the US justification for the Gulf war as a defence of the (gas-guzzling) 'American way of life'. The reverse is also true. As the supersession of neo-liberalism attests again, parties of property are rarely liberal parties and more commonly conservative parties using the resources of 'tradition' to defend privilege and the resources of 'culture' to secure the right to rule. Not only is the use of this discourse to the elites of most capitalist societies in managing internal dissent by 'othering' it as alien – 'enemies within' – tried and tested, culturalism refines it further by basing difference on culture, abandoning the problematic biological arena where science could be marshalled against it.[13] In the present context other advantages of culturalism would include its utility to various bourgeoisies negotiating their position in an international pecking order, not least through product differentiation for their 'culture' industries (appropriating, as in all other industries, the cultural labour of their 'ethnic' working populations). The pronounced anti-statism and opposition to collective political projects in the postmodern opposition to 'meta-narratives' facilitate the assimilation of these discourses to ideological formations which include some version of neo-liberalism with corresponding Popperian aversions to "social engineering".

Embourgeoisment of Gandhi

Kindred intellectual currents in India – mainly neo-Gandhian populisms have been gaining ground over the last couple of decades. Becoming academically as well as culturally fashionable, they have not, for all their supposed nativism, emerged in isolation from the international sway of postmodern currents though they are even more tied to the imperatives of the bourgeois right as it has been emerging in India recently. Engaged in a far more purposeful anti-socialism given the presence of an organised Left,[14] they have been repaid with correspondingly more terrestrial, political and intellectual engagement also due, surely, to the lesser intellectual sophistication of these currents. They harness modern India's founding conservative tradition, Gandhianism, while also modifying it to suit the significantly altered contemporary political purposes of the right Neo-Gandhianism opposes the allegedly oppressive and homogenising values and institutions of enlightenment and 'modernity' which, in the Indian context, can also draw upon the legitimacy of certain strands of past anti-colonialism (as a substitute to any current anti-imperialism, of course) in the name of an authentic traditional Indianness which has (give or take a qualification or two) escaped the ravages of this modernity. These increasingly mainstream discourses come disturbingly close to hindutva and, in some cases, like Nandy's, are articulating a contemporary bourgeois form of it, political hindutva.

There is much in Gandhianism which lends itself to these uses. Chiefly, it is a culturalist, indigenist, and flexible ideology with a record to service to property. It proved able to serve a coalition of diverse classes of the propertied in the anti-colonial enterprise and in independent India. They were, on the one hand, the big industrial bourgeoisie whose devotion to Gandhi was as notable as were, despite his stated opposition to modern industrialism, his services to them through his unique brand of ideology and politics – trusteeship and non-violence particularly – as also through his willing deployment of his moral power in their service. Their bourgeoisification had reduced the need to rely on brahminical hierarchies to secure their position, though it had not eliminated it. In any case, the preservation of property and privilege in India was then reliant on a rather different group, as Gandhi acutely recognised, to whom a suitable version of brahminism would be crucially important: rural landlords as well as substantial peasant and tenant landholders of the dominant proprietary castes. They adhered to Gandhi for the legitimacy he attributed to property and to their status as the locally-based arbiters of affairs in rural India. Although Gandhi's discourse had a wide mass appeal because it tapped the popular (though, by the 20th century, no longer radical) impulses of bhakti, both Gandhi's idiom and his message catered to the rural classes, not the masses who were mobilised largely under the tutelage of their dominant caste patrons. Gandhi's celebrated reinterpretation of Hinduism was premised on the insight that brahminism could only continue to be legitimated at the price of extending its boundaries to include the better-off 'improved' shudras. After all, the reality was that the vast majority of holders of property in the country whose political power would become effective in the coming liberal democratic context were the non-brahmin, non-savarna (twice-born), 'forward caste', touchable shudras. Enterprisingly grasping commercial opportunities and anxious for cultural/ritual upward mobility to match the economic, they would, he wagered, respond to a brahminical Hinduism expanded to include them.[15]

These propertied groups as yet feared little challenge to their respective positions and, for an ideology of property, Gandhianism could appear astonishingly benign, even reformist (as with his campaign against ritual untouchability, though not its socio-economic dimensions). And the propertied were largely immune to the temptations of the more militant Hindu nationalism which had also arisen as an organised political force by the 1920s. Its repressive quotient was to

remain, as it were, surplus to requirements until the 1980s. Until then it remained confined to a small urban petty bourgeois and (largely for reasons of the specificity of the caste structure) northern and western base. Even so, many of the adherents of Hindu nationalism were accommodated in Gandhi's Congress usually in alliance with the powerful Congress right.[16] Nehru's project of industrial development upon which the Indian state ambitiously embarked upon independence obscured (and remained hostage to) Gandhianism which remained the active ideology of the propertied class. Its most numerous members still organised their dominance locally aided, ironically, by the substantial welfarist elements financed by the developmentalist state in an expansionary economic climate. Funded by the state, Gandhianism also spawned a vast network of 'social service' organisations, supported by the local propertied elites, whose interventions in the affairs of the poor were, with a handful of exceptions, pacific if not outright repressive.[17]

Neo-Gandhianism emerged in the 1970s. It was a conjuncture marked not only by the transformation of the rural landed into a capitalist class, but also by associated political and economic crisis. These developments marked the beginnings of a polarisation of Indian society and politics whose contours are still not fully mapped. It may be safe to say, nevertheless, that Indira Gandhi's apparently 'left-populist' response to that crisis attempted, improbably, to secure the interests of big industrial capital through state actions legitimised on the strength of (largely illusory) crumbs thrown the way of the poor, rural and urban. The turbulent dynamic of their disillusion combined, momentarily, with the opposition of the rest of the rural and urban bourgeoisie, now, in north India at least, outside Congress, in the movement led by Gandhian socialist Jayaprakash (JP) Narayan. As it emerged from the crucible of the Emergency, this formation, now represented by the clutch of parties – various right-wing splinters of the old Congress party and the Hindu nationalists – which became the chief beneficiaries of the electorate's verdict in 1977, forming the 'Janata' government, clearly revealed itself as the class of property, distinguishable from the social basis of Gandhianism by its now being uniformly and consciously capitalist and professing a neo-Gandhianism as its ideology. Because hitherto big bourgeois power tended to be exercised on the executive, away from the parliamentary political fray, and because the power of landed property has been confined to state politics, this event actually marked the political arrival of the bourgeoisie on the national parliamentary political scene.

While faithful to the culturalist, anti-materialist bent of the original, neo-Gandhianism registered shifts which must now seem familiar, representing a hardening of positions against liberalism and the Left as the 1980s advanced. The revival and exegesis of Gandhi's thought upon which neo-Gandhians tacked their new concerns attempted to make Gandhi into a systematic political thinker. However marvellously effective his political practice in mobilising rural elites and keeping control of the national movement for long periods, as much as in outwitting the Raj, this claim can be doubted. Even less tenably, given the deep, if eclectic, western, indeed Orientalist influences on the London-trained barrister, he was constructed as a 'non-western', that is to say a 'non-enlightenment' thinker, as ineffably Indian, 'outside' the discourse of the 'west', of modern universalist, rational enlightenment thinking.[18] This move, though unconvincing, is not bewildering: it's motives are clear. The neo-Gandhians can now drape this fig-leaf of the irrelevance of the enlightenment and of 'western' discourse in general to their intellectual efforts over the vast fleshy bulk of their derivations from anti-enlightenment postmodernism and post-structuralism as well as their eclectic and convenient departures from them.[19] Posing as 'authentically Indian', inaccessible to, and therefore unaccountable to 'outsiders' – it uses ineffability as product differentiating (secret) patent. It allows the neo-Gandhians to assert themselves internationally without having to prove themselves in genuine intellectual engagement. The neo-Gandhians' posture of progressiveness, greatly aided by the breathtakingly uncritical international prestige the figure of Gandhi enjoys, is based on a repression of his less than emancipatory role in Indian history. The burden of that is displaced onto Nehruvian 'westernised elites' – i e, 'modernist' (inauthentic), rationalist/statist/bureaucratic (oppressive), developmentalist (historicist) and universalist (alien) liberalism and, more importantly, the Left. The emancipation of Indians (which is, of course, now redefined as a more or less cultural matter) was thwarted because the freedom struggle eventuated in a modernist, statist developmentalist bureaucratic regime, a creature of the hysterically rationalist, westernised Indian elites, liberal and left-wing, form which they should be rescued.[20]

Fittingly for an ideology of the bourgeoisie in a capitalist country, Ashis Nandy's discourse issues from one of the most influential research centres in India, reflecting the country's academic mainstream. Nandy has been at the Centre for the Study of Developing Societies (CSDS), New Delhi[21] since it was set up in the mid-1960s by the noted political scientist and now widely respected public figure, Rajni Kothari. Trained at the LSE, Kothari had then begun to gain recognition for his work on the 'Congress system' and the thrust of the work of the CSDS was to study Indian politics through extensive empirical studies in an "analytic perspective different from that provided by the dominant schools of thought – liberal, conservative or Marxist [sic]".[22] There was some concern that Indian politics be understood in terms which made sense in the Indian context, – a sort of 'indigenisation' of the discourse of social science appears to have been aimed at. This actually signalled a desire to supplant the pre-eminence and political influence enjoyed by Marxist scholarship and by intellectuals who were in sympathy with the Left in India. However, a glance at the list of the early publications of the centre reveals that in reality its perspective was captive of the terms and categories of the dominant western social sciences of the time as they applied to developing countries – the sociology of modernisation and American political science. And the work of the centre since then has continued to follow the scholarly fashion of the times – from modernisation to suitably de-Marxified versions of dependency[23] in the 1970s to the present 'Gandhian' focus on poverty and social movements (with a pre-occupation with the cultural) reflecting the culturalisation of the concerns of development theory and the corresponding minimalism of its material ambitions today.[24] It seems that the indigenising aim merely justified a theoretical looseness and, until the late 1970s at least, was pursued through the sheer volume of work in a non-descript mainstream mould, which the centre generated, and to which mainstream and anti-Left elements in the cultural institutions – the universities and the media in particular – could look. By the early 1980s, as Indian politics began to register rightward shifts, their increasing interest was rewarded with neo-Gandhianism.

The CSDS's present neo-Gandhian ideological perspective focuses on social movements particularly among the 'culturally marginalised' of India through

a discourse of 'democracy' and 'human rights' inflected towards the cultural. It emerged, as might be expected of intellectuals usually bringing up the rear of political events, only after the end of the J P movement and the Emergency which followed – regarded by its members as being a critical watershed in the centre's life. A new journal and institute, *Lokayan*, was launched as "a forum of interaction between intellectuals and activists in these [social] movements".[25] The fairly conventional sociological, electoral and other empirical studies which have been so characteristic of the centre's work throughout have continued with only a tenuous link with its increasingly prominent neo-Gandhian project, partly because it is associated with only some of its members and partly, no doubt, attesting to its status as an ideology rather than a genuine theory which can be operationalised for the study of Indian politics. Indeed, while some of the empirical work done by the CSDS – its election studies particularly come to mind – have been found widely useful, it has not been known for the quality of the understandings of Indian politics it has produced. Kothari himself, whose work on the 'Congress system' had the misfortune of suffering the practical criticism of the electorate in elections immediately following, respected not so much for the penetration and rigour of his scholarly work as for his progressive positions on public issues (in keeping with a generous and humane intent rather than the more problematic logic of his thinking, it must be assumed).

The CSDS was also committed to understanding and examining India's relationship with the rest of the world and the latter's impact on it as well as the prospects for peace generally. Soon after its formation the CSDS found its feet in a particular sector of third worldist academic discourse. It was not the third worldism of dependency theory – the "unhappy consciousness of progressive intellectuals... on or just over the dividing line between reluctant acceptance and impatient rejection of the structure but not starting out from or conditioned by involvement in the entirely different practice of a radical working class or peasant party".[26] Even that, though largely academic, would have been too tainted by 'alien' Marxism. Nor was it a substitute for a radical political commitment which it became for so many metropolitan intellectuals. Being in the third-world presumably greatly lessened the psychological urgency of any such commitment. Instead it was the sanguine and dreamy third worldism of the World Order Models Project (WOMP), an international group of academics set up as "a systematic multinational inquiry into the nature of preferred world political systems",[27] interested in thinking up different visions of world order, emerging from different 'cultures' on the basis of which alternatives to the present world order could be conceived, a sort of academic Nativist International. Ashis Nandy views the broader problematic within which the WOMPers, as members liked to be known, worked as a 'futurism'[28] which was social scientif . in contrast to the technicist mainstream versions. It is thereby, one suspects, capable of exercising more eclecticism and freedom from the dictates of either reason or evidence than normally acceptable even in mediocre social science.

The CSDS associated itself with this international network beginning in February 1968 when its first meeting took place in New Delhi. The journal, *Alternatives*, although also publishing work originating more widely, is essentially the house journal of this trend. Jointly edited from India and one or more of its two other bases in Japan and North America, its present position in the firmament of English language social science may be gleaned from its claim to "consider emerging new forms of world politics, challenging the ethnocentrism of much modern social and political analysis and emphasise the possibilities of a humane global polity" as "a much needed forum for feminist, post-colonial and postmodern scholarship in International Relations".[29] However well-meaning, the WOMPers had neither any clearly stated political or intellectual commitments, nor was their work to register the anguish and urgency so characteristic of most third worldism. No major scholarly departures have emerged from it, and WOMP appears to operate primarily as an international network of mutually supporting and citing academics who meet periodically at exotic locations. Nandy, along with the centre, is also associated with the network and the journal, beginning regular publication in the latter in 1978 and joining the editorial team in 1983.

Nandy's Irrationalised Elite Culturalism: An Outline

Nandy's version of neo-Gandhianism claims to be more genuinely emancipatory than the west's rationalist and materialist enlightenment discourse, but it is actually an all too fashionable, and by now familiar, opposition to the Left, liberalism and reason itself. He claims to replace western enlightenment rationalism with something he favours with the term 'critical traditionalism' as the discourse of emancipation. However, his conception of 'tradition' or 'culture' or 'civilisation' (terms he uses interchangeably) is an elite and conservative, and in the case of India, a brahminical, one. Moreover, he never indicates the distinctive rationality 'critical traditionalism' is supposed to embody. This core of irrationalism which has shrugged off the yoke of any (indigenous, authentic, traditional or any other) rationality which may call it to account, precluding any rational discursive engagement on the grounds of reasons' definitional inauthenticity and alienness, imparts to Nandy's discourse a profound potential for authoritarianism. These broad, generically cultural nationalist arguments, have drawn rather little critical attention although their political complicity in the Indian setting could not entirely escape attention.

Nandy recalls that it was his exposure to future studies and "personal encounters with the likes of Ivan Ilich, Gustavo Esteva, Mihailo Marcovic, Odera Oruka, Majid Rahnema and [Eleonora] Masini... who had bypassed the standard academic concerns of the standard universities of the First World... [that]... convinced me that categories and systems of knowledge underwrote dominance more successfully than naked political and economic power".[30] Whatever Nandy's reasons for implicating this singularly undistinguished line-up of his futurist friends, beginning with his first notably successful work *The Intimate Enemy* (1983), Nandy's writings have revolved around the trite opposition between the modern, western, homogenising, enlightenment-derived universal '(non-)culture' of "people who have been uprooted – from their pasts, from their cultures, and from less impersonal communities which often ensure the continuity of traditions"[31] and 'non-modern', 'traditional' particularisms or 'cultures'. Threatened by 'modern' 'western' science, state, reason, history, progress/development, secularism and a host of other enlightenment-based values and institutions, the 'non-modern' resists only by being: 'traditional' culture "is not only the language of resistence, it is itself resistance especially to oppression which comes packaged as historical necessity, often under the names of such worthy causes as a scientific history, technological growth, national security and/or development".[32]

Through the instrumentality of colonialism modern 'global mass culture' has

established beach-heads in the 'non-west', the third world or the south (used interchangeably) in the form of their westernised, modern urban middle classes. While political economy and profits may have been part of colonialism, it is primarily a 'state of mind', which is why it has not been defeated yet, why it is still expanding the reach of that culture which "needs to be defeated ultimately in the minds of men".[33] But at least one of Nandy's targets is both nearer and more palpable: even more than the western or global manifestation of these forces, the modern state in India, as elsewhere in the 'non-west', represents a particularly malign and culpable concentration of all these forces. It has become overwhelmingly dominant and it is against the threat it represents to 'non-modern innocence' that the battle to save what remains of it must take place. But 'traditional culture' the humane and tolerant alternative to the full horror of rationalising, impersonal self-hating modernity, is powerless against the organised might at the disposal of western culture and its colonised agents in the 'non-west'. Thus it is the duty of the true dissenters to speak out for the "humble citizens of these societies who... formally have democratic rights but not the right to bring their identities, culture and idiom into politics or the right to define their preferred futures".[34] Most Indian believe, Nandy argues, equally mistakenly, either that the state is actually pitifully small and powerless, an attitude which is a left-over from colonialism, or trust in small reforms and correctives as the remedy. But yet others,

> a small number of Indians – mostly representing some vestigial forms of Gandhism and post-Maoist Marxism, and the rest being activists and scholars with no clear ideological position – who are trying to interpret the burgeoning peasant movements and the self-affirmation of a variety of minorities, from the tribals to the landless labourers to the untouchables... has begun to think that the problem with the Indian nation-state is not its failure but its success and that they are now dealing with a state which represents an exaggerated and partly pathological extension of the normal anxieties of a post-colonial society [sic].[35]

It is not only the anti-statism of the diagnosis which this culturalism shares with neo-liberalism and postmodernism. The prescription is also familiar: the awareness that "genocides, ecodisasters and ethnocides are but the underside of secular hierarchies, which have reduced major civilisations to the status of a set of empty rituals" makes it possible to "look askance at the old universalism within which the earlier critiques of colonialism were offered".[36] The old rational universalism of left and liberal currents must give way to efforts "to justify and defend the innocence [of the 'non-modern' or 'traditional' colonised cultures] which confronted modern western colonialism".[37] This requires a new type of dissent, more clever and more genuine than the old style dissent which is actually a form of complicity in which "the ruled fight their rulers within the psychological limits set by the latter".[38] Collapsing limited and dominating forms of instrumental reason into reason itself, as is so typical of contemporary culturalism, Nandy argues that dissent which truly aims to escape these all encompassing structures must be respecting of the "plurality of dissent ...partly by articulating it in a language that will not be fully comprehensible on the other side of the global fence of academic respectability."[39]

The achievement of 'justice, compassion and freedom' for the "illiterate savage pitting his naked body against the might of high technology of his oppression"[40] requires, therefore, not 'critical modernity' which, Nandy claims, joining the international anti-socialist chorus, has failed, but what he would term 'critical traditionalism'. One searches in vain in his writings for the opposing concept of 'dominant' tradition. Indeed, as we have already seen, all domination is 'modern' and 'tradition' is, in Nandy's view, progressive by definition, so the adjective in the phrase is a verbal superfluity, a redundancy. But more than that, Nandy's references from the corpus of Indian tradition remain primarily brahminical (which is also, needless to say, Hindu) with Gandhianism as the outer limit and badge of his 'radicalism' (as Nandy's repeated tracing of the boundaries between it and the even more elite 'savarna' brahminism demonstrates). On the one hand Nandy fails to comment on the 'alien', even Orientalist origins of much contemporary discourse on 'Indian' tradition he deploys – whether of a Gandhi or a Coomaraswamy. The former is explicitly (and the others by association) placed 'outside' universalist enlightenment discourse. On the other hand, any of the actually existing critiques of this 'tradition' articulated by Indians would, by Nandy's lights, be infected with the incubus of 'alien' universalism and colonising rationalism – whether it be the liberalism of a Rammohun Roy or a Sayyid Ahmad Khan, communism, the caste-critique of a Phule or an Ambedkar or the feminism of a Tarabai Shinde. None of these find a place in Nandy's conception of the 'Indian tradition'.

Nandy enjoys mutually reinforcing reputations – in India because of his claims to western success and in the west because of his claims to Indian authenticity. While it would be all too easy to exaggerate each of these claims, Nandy's success in the west has one notable quality. Due to a mixture of fashionability, profound ignorance about India even among scholars, and to the efforts of a small band of Nandy's followers and promoters from his futurist academic network, located in the unfortunate 'standard' universities of the English-speaking world, Nandy's claims to progressiveness are most successful there.[41] The extent to which Ashis Nandy's public profile there is built on his own claims, a process greatly aided by that peculiar form of scholarly(sic) publication, the interview, is surprising only until one realises that in contrast to the significant promotion, there is practically no serious interrogation of his work.[42] Nandy's followers and promoters would elevate him to the status of an iconoclastic prophet of liberation from the south, empowering 'the southern intellectual',[43] and of an intellectual (rather than an academic: a reader, frustrated with his relentless inconsistencies, can be forgiven for suspecting that this is chiefly a means of exempting Nandy from compliance with even the most basic rigours of scholarly discourse) who attempts to theorise the work of social activists working among the 'non-modern' who 'constitute and majority of the world'[44] and is 'rooted' in Indian society by birth, training and professional base.[45] And not without a great deal of heaving from the self-promoting Nandy himself.[46] Claiming freedom from any recognisable intellectual current (surely a routine claim of the more unoriginal among thinkers), Nandy works to establish his own brand of culturalism in the academic arena dominated by postmodernism and post-structuralism:

> ...I am...aware that [the new type of dissent] could be a severe threat to those who want to be the voice of the voiceless and the intellectual spokespersons for the oppressed of the world. For we live in a world where the obvious has to be justified in ornate, almost baroque language of scientised social analysis or packaged in the esoteric textual analyses to be legitimate to the intellectual community. I suspect that the main reason for this is the subtle but exceedingly well-organised efforts that go on in the metropolitan centres of knowledge to locate not merely the capitals

of the global political economy in the west but also the capitals of dissent in the fashionable universities, think tanks and, other intellectual centres of the first world. No hegemony is complete unless the predictability of dissent is ensured and that cannot be done unless powerful criteria are set up to decide what is authentic, sane, rational dissent and, then, these criteria are systematically institutionalised through the university system. This is the process that we are witnessing in the burgeoning intellectual fashion industry, inundated these days with such powerful brand names as postmodernism, post-coloniality and post-structuralism.[47]

His devotees, manfully persist nevertheless in attempting to place Nandy in the wider framework of contemporary western academic culturalist discourse. According to one particularly hyperbolic writer, Nandy is "poised to exercise an incalculable influence...when much of the allegedly radical critiques [sic] associated with post-structuralism, post-modernism and post-Marxism are shown to be largely ephemeral". Even while soliciting invitations for him into the 'postmodern palace of language games', they admit to the fear that "he may have to content himself with a room in the subsidised minoritarian wing" (unsure, one suspects, of whether this is due entirely to the structures of cultural imperialism).[48]

Nandy's Indian audience includes a Left and it has had the opportunity to witness the practical implications of Nandy's discourse from closer quarters. Here his radical credentials are harder to take seriously. Of the two major public issues on which Nandy has taken a stand, Nandy's views on the 1987 incident of sati, discussed below, was seen as dangerously vacillating and obfuscating if not outright reactionary, while his stand on the debate about the theory and practice of secularism set off by the rise of the forces of hindutva, discussed later, has been seen as 'appropriable' by those forces.

The notorious sati in Deorala, Rajasthan in 1987 was actually the public and ritualised murder of a young widow, Roop Kanwar, by members of her upwardly mobile family seeking social validation of their wealth by 'reviving' an allegedly 'traditional' high caste practice. It attracted nationwide condemnation also because it was staged as a high-profile event with members of the Rajasthan government on the list of invited guests. Nandy, however, issued a tirade against the widespread condemnation of the perpetrators rather than against the perpetrators:[49] the condemnations, he alleged, were vulgar and simple-minded acts of those who failed to understand the complexities of the situation. Never known to be tender-hearted towards feminism – an 'old', 'complicit', 'modern' and of course, 'western' form of dissent of which he is dismissive – he complained, in particular, that these condemnations had been elicited by the clamour of urban, westernised feminists pitted against 'tradition'. He then proceeded to instruct his benighted 'westernised' urban-middle class 'elite' audience on the complexities of 'tradition'. He distinguished between two types of sati – the 'Ghatna' – episodic, exceptional, and authentically an act of 'self-sacrifice', and what he called 'epidemics' – more worrying and pathological. The purpose of this distinction remained, however, rather mystifying as he could not seem to decide where the death of Roop Kanwar fitted. The incident in Deorala, he claimed, looked like the beginning of an 'epidemic'. Nandy blamed it on 'market morality': it was a "pathology [which] came out only when the traditional way of life began to collapse due to the onslaught of outside forces". However, he also claimed in the same breath that Roop Kanwar's sati had been an act of 'self-sacrifice' even though there was ample possibility of coercion.

His critics, Zoya Hasan and Imrana Qadeer,[50] identified the chief problems with this position. By identifying 'market morality' as the culprit, he exonerated "the role of tradition, Hindu or otherwise, in reviving and glorifying Sati". But he also did not analyse how 'market morality' had been at work in the Deorala incident. Nandy justified his opposition to the condemnation of the sati by pleading, in the face of the known facts about the socio-economic status of Roop Kanwar's marital family, and the rather glaring fact that the rationale behind the whole incident had been its desire to be seen to adopt a high caste practice, that "it is the practice of the poor, the powerless and the unsophisticated, which invite censure". Finally, even while considering the rather obvious possibility that Roop Kanwar had been coerced, and in the face of his other suggestion that the Deorala incident seemed to fit the 'pathological' type of sati, he legitimised the event by seeing the incident as a case of 'self-destruction' as, indeed, the perpetrators wished it to be seen, and likening it to public and political fasts of Gandhian leaders, a heroic and authentically 'traditional' act.

Although Qadeer and Hasan drew a line between the religious revivalists and Nandy, seeing him, at most, as intellectually irresponsible, Nandy's conservative authoritarian slip was already showing under his progressive drag. Whatever he may hope we would understand by his use of the terms 'non-modern' and 'traditional', we would be naive and uninformed to understand by it swathes of social life untouched by capitalism and commodification, preferably blamelessly poor, anywhere in the world. On the contrary, in backward capitalist social formations in which the bulk of the third world, and certainly Indian, population lives (and arguably in stagnant capitalisms everywhere), the authoritative assertion of tradition is the discourse of a now more or less capitalist elite harnessing the non-economic resources of 'tradition' in the hyper-exploitation of lower castes, classes and women, perpetuating a distinctive fraud against even the capitalist ideal of the exchange of equivalents, not to mention wielding it against 'modern' and 'alien' ideas such as social justice. It is an elite not unlike Roop Kanwar's family to whom Nandy's endorsement of 'tradition' and related condemnation of 'market morality' is handy precisely because it is the crass capitalist basis of their wealth they would cloak with 'tradition'. And by seeing her murder as 'self-destruction', if of a deeply grieved impetuous young woman, Nandy gives the family's claim to 'traditionalism' precisely the legitimacy it sought. His targets are the 'modern' progressives – liberal, feminist and leftist – who are accused of being uprooted from their 'traditional' roots, inauthentic and not really concerned with freedom and emancipation but aiming only to aggrandise the power of the modern state to which they have exclusive access. This obviously laughable idea of the identity of India's ruling elite is mainly meant to impart to the increasing political assertion of the Indian bourgeoisie, which now includes this elite of prosperous capitalist farmers, the oppositional stance it needs to take – the 'genuine' dissent/resistance of 'tradition' – against critical currents at home and as a counterfeit 'resistance' to 'homogenising' globalisation internationally.

The significance of Ashis Nandy is not intellectual – after all how many scholars could take one who claims to be 'making myths' as a seriously as a peer? Politically however, his claim to be making myths is oxymoronic only if his voice were a solitary one. And it is not. Along with legion petty and weighty 'opinion leaders' in India, from provincial scribblers and lecturers to editors of national newspapers and politicians, Nandy is engaged in the manufacture of a distinct and new national identity. While Nandy's scholarly credentials may not stand up to scrutiny,

among these minions he must emerge as one of the more esoteric, not to mention more conscious about his ideological claim and antecedents. We are told by Nandy that "while Rabindranath Tagore wanted to turn all Indians into brahmins, Gandhi sought to turn them all into shudras".[51] In his turn Nandy wants all Indians to be the new Indian bourgeoisie – his 'average Indian'[52] – vastly expanded in numbers (as also in consumption capacity so beloved of the liberalisation lobby) and radically changed in composition by the critical infusion of the vast rural but rapidly urbanising capitalists, and of the less numerous but qualitatively significant new breed of maverick businessmen and NRIs (non-resident Indians: people of Indian origin and/or nationality residing abroad). Such segmentation hides their underlying unification as a capitalist class and indeed, it is today more pan-Indian than any time since independence, not to mention global. Like any partial identity substituting for a 'national' one, this project is ultimately about the putting that identity above judgment, making it the standard by which everyone else will be judged, in short hegemonic. With receding possibilities of effective challenges from below, it is already distinctly less genteel or urbane, indeed, often brazenly aggressive, in its self-images. This Indian bourgeoisie is also the principal arbiter of the fate of hindutva, its natural constituency, and the political inflection of its identity, already prone in an authoritarian direction, is an important factor in India's near political future.

Hindutva and Indian Bourgeoisie

In recent decades India's political economy and politics have undergone interlocking changes: the new economic strategies pursued by the state-liberalisation and globalisation and the rise of authoritarian tendencies ranging from the aggression of local elites and police forces to the rise of hindutva as an organised authoritarian option. Rather than being major discontinuities in India's evolution, as they are still commonly held to be, since the 1970s at least, it has been clear that, in the absence of nationally organised politics of the bottom half of Indian society, these changes have been commonly determined by the bourgeoisification of India's propertied classes, in effect an expansion of the bourgeoisie, and its political assertion.[53]

The most numerically weighty addition to the bourgeoisie has come from the commercialisation of agriculture and the spread of capitalist relations of production in it. At independence in 1947, the Indian social formation was indeed distinctive in the third world for having a well-developed big industrial bourgeoisie which was able to use the state to accelerate and diversify industrial growth.[54] The post-independence Congress government under Nehru is widely regarded as having embarked upon an intemperately hasty industrialisation programme, compromising the interest of the more populous agriculture.[55] The large public sector component of the Nehruvian industrial strategy was not 'socialist', but reflected this ability. In the bureaucratic and planning effort required they were aided by a largely upper caste professional or intellectual class.[56] It is not without significance that, except for parties based on disgruntled former landlords and petty princes, no conservative party, certainly no party of capital, was formed in this period[57] and the party of Hindu nationalism, then known as the Bharatiya Jan Sangh (BJS) remained a small presence in parliament – confined to its urban petty bourgeois base.

For all that, however, the political power of the big bourgeoisie was circumscribed. Its proportionally small size, contrasted with the corresponding vastness of the countryside, meant that its power was predicated upon an alliance with the effective holders of the land – the regional dominant caste peasant elite. This alliance had been cemented by Mahatma Gandhi in the 1920s in a political move which was the beginning of the end of British rule. The organisational history of the Congress party since it became a mass organisation in this period registered, given the regional bases of the power of these groups, particularly in its federal structure, the evolution of this alliance. The power of the landed elites had grown with the commercialisation, commodification and spread of capitalist relations of production in the countryside which had been well under way in the 19th century. It had recently accelerated with the establishment of a federal structure in the colonial government in anticipation of eventual independence in the mid-1930s which gave the landholders access to provincial (later called) state power. In areas of landlordism these regional elites tended to be tenants and, Gandhi having successfully prevented the struggle against landlords from diverting from the nationalist purpose until independence, Congress's 'land reform' of the 1950s was, not surprisingly, nothing much more than the consummation of this alliance, entailing but the vesting of land in the hands of these dominant caste tenants (even while leaving former landlords in possession of shrunken but consolidated and efficient pieces of land). This land reform, which led to the 'landlord' and 'peasant' capitalisms of the 1960s onwards, shaped the future of the Indian polity and social formation as much as the more spectacular industrialisation programme. It brought in its train not only an acceleration of commercialisation and the development of capitalist relations in the countryside on its own, but also, as the class of middle, and rich peasants and capitalist farmers grew more politically vocal, further speed-ups of the process with state-sponsorship of the green and white revolutions which, furthermore, weighted agricultural growth towards more distinctively capitalist, investment-driven strategies.

The strategy of industrialisation, for its part, though initially successful in registering strong growth rates and in setting the basis for the diversified industrial structure which India now boasts, soon fell foul of political constraints upon the Nehruvian state. The reality of the political power of the rural landed groups was that they controlled not only state power in the states but could also limit the options of the central government through the structures of the Congress Party. The political representatives of these groups not only diverted substantial budgetary and plan resources towards agriculture, they also made it impossible for the state to extend its tax base to include rural income and wealth.[58] Industrial growth, which had always been parasitical upon public investment as its motor, slowed as the state ran into a fiscal crisis in the late 1960s. When it picked up, after the late 1970s, it now manifested a very different more 'liberalised' pattern: no longer biased towards basic industries and fuelled by state investments, its progressively decontrolled private sector focused on the consumer spending of India's vast rural as well as urban middle classes, though still financed (now at the consumer end) by state deficits and higher rates of borrowing abroad to provide for the import intensity of the pattern.

Until the late 1960s the mode of the exercise of the power of property in the Indian political system tended to dissimulate it: the big bourgeoisie working behind the scenes with the government to secure its interests and power of the rural landed groups, though very real, hidden in the complex structuration of power in Congress Party. After that point, however, the power of the latter – numerically significant and now increasingly bourgeois – had grown to an extent that, and met

impediments in its struggle for state resources to an extent that, it would no longer be contained within Congress. The arrival of this class in Indian party politics in the late 1960s is actually its emergence from Congress. Patchy and regionally specific though it was, it eroded the Congress-centred stability of the party system for the next several decades. Those who had been too blinded by the shiny veneer of Nehruvian developmentalism at the national level to see the workings of the power of the landed elites at the state level, or had accepted the cold war ideology regarding the identity of the Indian elites, and thought of the tone of Indian politics after independence as being set by an urban westernised Nehruvian elite saw in this shift 'a massive alteration in style, language and modes of behaviour, reflecting far more the actual cultural understandings of rural Indian society rather than the westernised cultivation of the elite which inherited power in the Nehru years'.[59] Actually, these fairly acute understandings of Indian political and cultural dynamics had been the basis not only of Gandhi's acute political strategies mentioned above, but also embedded in the practices of regionally based Congress politicians managing complex alliances and reward structures, the basis of Congress dominance.[60]

Initially this newly independent political interest took shape successively in the form of agrarian parties and non-party farmers' movements in different regions of India demanding state subsidies for inputs into capitalist farming such as fertiliser and electricity and higher state procurement prices for grain, in short, better terms of trade with the industrial sector. In this, now largely intra-middle class conflict, the deployment of 'urban bias' arguments in a new populism or 'new agrarianism', accompanied by a romantic celebration of the authentic rusticity of a harmonious pristine 'Bharat' pitted against the menacing might of urban and industrial 'India'[61] is meant, of course, to obscure the fact that the brunt of the adverse terms of trade have been borne by the agricultural labourers, whereas prosperous and capitalist farmers have reaped huge cost-plus surpluses on procurement prices geared to the lower productivity of medium and small farmers.[62] It can be argued, however, that the rise of regional parties from the late 1970s onwards reflected the complex reality of this 'rural' bourgeoisie more accurately: By the 1980s, if not earlier, it was clear that the character and aspirations of this class were no longer exclusively rural. While the original wealth of this segment was certainly in the land, any visitor to one of the scores of bustling mid-sized towns and cities of India can tell, their investments are not confined to agriculture:

> A typical family of this ....class has a landholding in its native village, cultivated by hired labour, bataidars, tenants or farm servants and supervised by the father or one son; business of various descriptions in towns – trade, finance, hotels, cinemas and contracts managed by other sons: and perhaps a young bright child who is a doctor or engineer or maybe even a professor at one of the small town universities that have sprouted all over the country over the past two decades.[63]

It was, therefore, not so much an agrarian bourgeoisie as what Balagopal rightly called a 'provincial propertied class'.[64] The regionalisation of Indian politics, reflecting the states-focused power base of this new segment of the bourgeoisie, which has become so settled a pattern by the 1990s, revolved as much around demands for more industrial development in the regions, as greater support for agriculture.

Recently Prabhat Patnaik et al[65] identified further instalments into the Indian bourgeoisie which while not adding to their numbers in the way the provincial/agrarian bourgeoisie did, significantly added to its heterogeneity and changed its character: a small number of entrepreneurs – medium industrialists – associated with the expansion of the energy and petroleum sectors in the mid-1970s to the mid-1980s which was distinctive in using "political connections ruthlessly and pursu[ing] an extra-ordinarily high risk strategy in contrast to the established older business houses"; and, with the gulf boom, the rise of the "non-resident Indian" (NRI) businessmen who were specifically "not production based...but...intermediaries: working out deals, fixing contracts, engaging in trade, above all in the burgeoning arms trade, and acting as a front for large MNCs, in particular arms manufacturers".[66] They also mention the resurgence of a financial sector from the remains of the banking community hit by the nationalisation of banks in 1969 through the new life breathed by deregulation into the stock market in the 1970s. Clearly the size, sectoral composition and orientation to the national state of the propertied classes of India has changed radically in the decades since independence. The class coalition between the big bourgeoisie and a landlord-peasant landed elite had been replaced by a single uniformly bourgeois class, albeit one of 'segmented' composition and even conflictual texture, a reality Patnaik and his colleagues marked by designating the process through which the class expanded as 'the proliferation of the bourgeoisie'.

At independence the (big industrial) bourgeoisie was identified with the 'Bombay Plan' as the blueprint for India's industrialisation. The unravelling of that strategy by the late 1960s brought slow but progressive deregulation of the Indian economy and a spurt of growth aimed at the absolutely enlarged but relatively narrow bourgeois market. While it is the import intensity of this pattern of industrialisation which led to the need for IMF loans in 1991 which, in turn, brought a drastic acceleration of deregulation, the shift towards external liberalisation and tight fiscal and monetary policies,[67] this change in economic policy is not without domestic bases of support which Patnaik and his colleagues were seeking to map. They argued that all sections have, by and large, favoured the contraction of the public sector which expanded the space available for their operations. However, for the rest "different sections of the bourgeoisie support different parts of the [liberalisation] programme, with some of them having reservations of varying degrees about the other parts".[68] Choosing the expand abroad, and hoping to secure the firm's interests domestically through behind-the scenes manoeuvring, big business has not opposed import liberalisation. The agricultural bourgeoisie though regretting cuts in subsidies, looks forward to the prospects for agricultural exports. Only NRIs support the programme in all its aspects. Thus, Patnaik et al argue, the proliferation of the bourgeoisie robs it of a common interest which would be the basis of any alternative to the IMF/World bank programme. Despite serious problems which are sure to plague the economy due to this type of programme, in particular deflation, there is no bourgeois alternative today.[69] They see hindutva's vacillation on the issue of globalisation as precisely reflecting this ambiguous configuration of interests and possibilities. The Indian bourgeoisie is developed to a relatively high degree and, while the BJP's rhetoric of national self reliance, of swadeshi, captures the ambiguity which such a bourgeoisie is bound to have about the recessionary consequences of these policies and the gaps in infrastructure development it leaves. However, Patnaik et al may yet overestimate the extent to which the Indian bourgeoisie, and hindutva acting as its political representative, may be able to

assert any distinctively Indian capitalist interest against metropolitan capitalist interests. The historic reliance of Indian capital on foreign technology, and therefore also on foreign finance, likely as not to become more acute upon the full convertibility of the rupee, has only become the sharper as the industrialisation path has become dependent on serving a set of internationally savvy consumers. Certainly the recent record of all three bourgeois political forces – the Congress, the United Front and the BJP – does not inspire confidence. In fact, it may be questioned whether an Indian, and more generally a national, capitalist interest even exists. Even those who have tried to argue that such an interest in retaining distinctive national (productive) configurations exists among the much more advanced industrial capitalist bourgeoisies such as the Japanese and the German are less than convincing because they fail to take into account the extent of the subordination of these hitherto distinctive productive formations to (now global) finance and the consequent worldwide bias towards deinstitutionalisation and marketisation on the model of the US and the UK under financial imperatives dictated by liquidity rather than productive ones dictated by efficiency.[70]

But if a bourgeois front against imperialism is lacking, the one against political assertion of workers and poorer sections from below is certainly not. And hindutva is the bourgeoisie's most resolute domestic face. Jayant Lele situates the rise of hindutva squarely in the erosion of the Congress hegemony. The dispersed and localised hegemonies of the rural landed dominant caste elites reliant on the residues of their pre-capitalist 'patriarchal-patrimonial' power, in short their dominance, dissolved with the commercialisation of agrarian relations[71] and with the diminution of the opportunity structures of the minimally welfarist state. This crisis of authority in the countryside has brought forth an authoritarian response given, on the one hand, the lack of state resources to prevent the minimal upward mobility among the lowest castes and groups from appearing to eat into the privileges of the increasingly ambitious propertied, and on the other, the caste subordination and expectation of deference upon which the backward capitalism of the Indian countryside would still rely to achieve required levels of super-exploitation. It was the key to what Lele called 'the ruralisation of neo-Hinduism',[72] without which hindutva would have remained electorally insignificant, confined to its northern and western urban petty bourgeois base.

Hindutva replaces the localised structure of hegemony, vertically linked through the Congress which had thus presided over a still residually pre-capitalist social formation with a famed tendency toward vertical – ethnic, caste, etc, – mobilisation with one which reflects the class-mass structures of a capitalist society, without, moreover, a significant left challenge at the national level. It works, like all cultural nationalisms, by identifying the nation with the dominant identity within it – in this case the 'Hindu' bourgeoisie – and formulating all problems as threats to the nation so defined as originating in more or less demonised minorities. Given brahminical Hinduism's elite character, these can include 'Hindu' recalcitrant subalterns when necessary. It is both unnecessary as well as improbable that this formation should reach particularly deep into the subordinate social strata ideologically when they can be controlled through judicious combinations of the dull edges of police lathis and the 'dull compulsions of economic relations' on the one hand, and on the other, co-optation and opportunistic alliances with their political representatives if politically disorganised and tenuously accountable, and marginalisation, if organised and resolute. It is important, however, that hindutva seek to consolidate the national bourgeois class, compensating for its economic segmentation with a cultural integration and endow it with clear purposes and reflexes (particularly against challenges from below) – in short, an (authoritarian) identity.

Never entirely 'imagined', 'nightmared-up', cultural nationalisms also draw on established cultural dynamics. Lele correctly sees hindutva as 'neo-Hinduism': a further development of the historically refined hegemonic impulses of brahmanism (the elite hegemonic tradition whose ascendance in the group of religious traditions usually termed 'Hinduism' has always been predicated upon imposing a unity, however fictitious, upon them). Taking its present form under colonialism as the "postulation of a distinct Hindu community... hindutva as a quality or property of [the brahmin comprador stand-in for the national community...in competition for the meagre resources of a colonial state] was a nationalistic reconstruction of the dynamics of Indian tradition, as a linear evolutionary, inclusive homogenisation".[73] The historical memory of successive challenges to it over its long history, is repressed by transforming them, through none-too-consistent (but never mind!) absorption, into 'Hindu' traditions.

Socio-politically, the numerically important provincial bourgeoisie based in peasant lower castes, Shudras, showed some inclination to oppose hindutva as a brahminical, upper-caste movement. This alternative to hindutva would, however, require an alliance between these landed elites and the poor and lowest caste agricultural labourers which has foundered, in UP, for example, on the obvious class contradiction. Moreover, the potential of shudra anti-brahminism relies on caste identities and ties which are already corroded by commercialisation. Compared to the all-too-well-trodden path of ritual upward mobility which legitimises the brahminical order and which is, moreover, being stridently revived and modernised by hindutva, its attraction for upwardly mobile shudras can be questioned. Thus although the regionally-based parties of the provincial bourgeoisies seemed to constitute, for a while at least, the chief if still bourgeois opposition to the forces of hindutva as the United Front coalition of regional parties orchestrated by the CPI(M),[74] the support later provided by some of the same provincial parties to the BJP government as much as the BJP's own further advances in its traditional strongholds and new inroads into other regions, show clearly how this class remains open to the wooing of hindutva. Even farmers' movements in western Uttar Pradesh, whose constituencies include large proportions of Muslims, have been ambivalent in their relationship to hindutva.[75]

Violent religious mobilisation and frenzy directed by secret fascistic organisations are the most visible, indeed, spectacular, strategies with which hindutva has recently sought to expand its appeal and many critical analyses are right to focus on it for the possibilities it represents are frightening in the extreme.[76] However, as argued above, the fortunes of hindutva must also be seen as determined by the entirely secular and contemporary (late 20th century) requirements of reconstituting a hegemony of the propertied whose Gandhian/Congress structures have disintegrated, overtaken by events. Hindutva's task is now different on two main counts: first, in contrast to the agglomeration of localised identities which made up the Indian nation, it must now construct a more unified pan-Indian hegemonic identity of a much larger, uniformly bourgeois class whose commercial and (familial) proprietary links stretch from the villages to western metropolises, and second, that in the circumstances of the effective abandonment of redistributive and even marginally welfarist

development, it must now take on a distinctively authoritarian form. The bourgeoisie is already, therefore, favourably inclined to hindutva. At the same time, hindutva's political fate yet depends on its ability to accommodate itself to the bourgeoisie's contemporary contours and imperatives by constructing an updated political hindutva. This is an ongoing task in which, along with many others nominally outside hindutva, Nandy is lending a hand. It makes any portrayal of hindutva as a once and for all formed force, rigid and unchanging, inaccurate.

Mirroring the Bourgeois Mind

Like the neo-Gandhianism of which it is a part, Nandy's ideas on culture and politics began to take shape with the political arrival of the Indian bourgeoisie in the mid to late 1970s. He has dismissed everything he wrote before that as irrelevant.[77] Nandy speaks as a member of this class in conversation with other members. Indeed, the many claims and assertions in his work which are avowedly casual hearsay seem to suggest that one of his more important research activities consists in after-dinner conversation over drinks![78] In its style, his writing resembles the new stream of cultural and political commentary in the English language press – intellectually undemanding prose with indulgent rhetorical flourishes, in which assertion takes the place of argument, and the convenience of the moment, of accuracy. Its defining themes – fashionably neo-Gandhian and anti-Nehruvian – are also Nandy's.

Ranging freely over subjects and disciplines whose unknown swathes seem never to constitute embarrassments, citing authorities, mediocrities and friends with even-handed profuseness, Nandy offers to domesticate social, political and historical knowledge within the narrow compass of bourgeois concerns. While ostensibly speaking of culture, society and politics, psychologist by training, learning his social science on the hoof as it were, at the CSDS, these amount to little more than (pop) psychology. What he dares to call social or political psychology actually seems to involve a focus on individual figures as convenient stand-ins for historical phenomena and processes. This approach, routine even in his allegedly scholarly essays, communicates even the vaguest of notions to his audience fairly effectively while also pandering to its narcissism as one historical figure after another, both likely and unlikely – M N Roy and D D Kosambi as much as Tagore, Gandhi and Savarkar – are attractively and comfortably assimilated to the growing identity of the contemporary Indian bourgeois.

While slippages, self-contradictions and inaccuracies characterise dominant cultures generally, powerfully flouting rational constraints on their wishful self-images, in Nandy's discourse, these become instances of a fashionable 'transcendence' of social science, 'mythmaking' (whose content, nevertheless, seems derived from sectors of social science especially chosen for their vulgar positivism!). This is not the only way in which Nandy evades responsibility for the views he expresses: never having set out his views systematically,[79] he claims to have been interested in making limited points – 'Let others debate it; the thing must be opened up'.[80] In a fashionably lax intellectual climate this cavalier style hardly touches Nandy's scholarly affectations, even as his role as a spokesman of the bourgeoisie is enhanced by them.

With Enemies Like These...

Some of Nandy's claims to oppose hindutva are clearly specious: for example, he claims that his Christian identity is proof against pro-hindutva inclinations. Quite apart from the tokenist non-Hindu, including Muslim, presence in the BJP, this ignores his own argument that the congruence between faith and political allegiance is far from complete and certainly the Hinduism of the proponents of hindutva itself, particularly questionable. Hindutva is about the construction of a particular sort of authoritarian and majoritarian cultural nationalism. While, in India, it must derive its themes from Hinduism, it is a secular political enterprise and members of religious minorities, whether as individuals or even, in certain instances, as leaders of minority organisations, can and do play a role in it.

Another part of his 'opposition' to hindutva is feigned by constructing a caricature of conservatism so exotic that the pervasive garden-variety of this political persuasion becomes harder to recognise. Nandy sees conservatism as a form of thought which "openly legitimises violence, greed and dominance".[81] In fact, conservatism relies on an appropriation of the authentic popular longings (for community, equality, liberty, among other things) even while it must necessarily distort these to legitimise existing relations of domination. (For example, no patriarch or sexist, to my knowledge – barring sadomasochism – has ever justified the domination of women as anything but good for them!) nineteenth-century anti-liberalism was parasitic on liberal ideals. The 20th century has seen conservatism and authoritarian reaction appropriate ideas of democracy and socialism, travestying them in theory and practice. In fact, like contemporary postmodernism, Nandy distils out of the long history of modern conservatism its essential anti-enlightenment character: the enlightenment is the root of the evil of modern social intervention; 'modernity' an incredible arrogance against 'tradition'; Reason, fanatical neurosis; liberalism, a hypocrisy; science, a form of ideological domination; history, tyranny; secularism, anti-religious zealotry and, of course, socialism little more than a caricature of Stalinism. Finally, like postmodernism and post-structuralism, Nandy also appropriates dissent, like democracy, liberalism and socialism hitherto, to the right-wing purposes of majoritarian cultural assertion which needs to appear oppositional.

Similar caricatures of fascism and fundamentalism, and relatedly of hindutva itself, are refracted through the framework of his Manichean opposition between 'tradition' and 'modernity', the one uniformly humane and benign, the other irredeemably oppressive.[82] It is not these *per se* but their 'modernity' which Nandy opposed. Given Nandy's construct of the 'modern', this means, not surprisingly, that critique is (mis)directed at only their wildest, most extreme and exoticised forms. At the same time, this 'opposition' to 'modern' fascism, fundamentalism and hindutva also serves to render them all acceptable in their more contemporary (postmodern?) and everyday versions. For example, portraying Fascism as essentially a hysterically exterminist 'modern' pathology serves to occlude its essential and far more routine and unexotic, but hardly less pernicious, authoritarianism and anti-Communism.[83] Or fundamentalism is caricatured as "usually identified with one or more texts which, rather than the ways of life of the believers, then become the final identifiers of the 'pure' forms of the religions".[84] Such a definition of fundamentalism, ostensibly based on Islamic and Christian 'fundamentalist' movements, has already benefited hindutva through unwarranted favourable contrast. But such a definition fits no actually existing fundamentalism.[85] Hinduism may indeed not have a single 'Bible' or 'Koran', but precisely like any other 'fundamentalism', hindutva claims the authority to definitively interpret and define the meaning of certain (often only purportedly) widely-held beliefs. Whether or not they come from textual sources

(and, in any case, even a single text has many interpretations) such authoritative interpreters also prefer to operate under as few constraints of logical or textual consistency as possible to cover for unforeseen imperatives.

However ostentatious Nandy's rejection of ('modern') fascism, fundamentalism and hindutva, one would have to be captive of a rather extreme form of nominalism not to see that amidst such distantiation from unsavoury labels, their substance is being redeemed and reconstructed by shedding unacceptably 'modern' and dated elements – such as statism and the unfashionable emphasis on assimilation – under the sign of all that is acceptable – 'tradition'. As 'tradition' hindutva can appear intrinsically and wholly humane (since Nandy's 'tradition' can have no oppressive elements). Its elite authoritarian brahminical character is not only obscured, it is positively cast as humane and progressive. In this form it will have far greater chances of ideological success among its bourgeois constituency, without sacrificing the essentials of hindutva – a majoritarian cultural assertion of the Indian bourgeoisie, deeply rooted in the historical dynamics of the Indian brahminical elites. While unquestioning of Indian capitalism's subordination in the global hierarchy of economic power, it is armed against (definitionally alien) challenges from below. Moreover, the irrationalised conception of 'tradition' which is operationalised in the Indian context to great effect – with no little help from brahminical and Orientalist sources – adds another feature convenient for authoritarianism: allowing this class to make up its hindutva as it goes along. All this is accomplished while making this hindutva sound progressive as, after all, any self-respecting bourgeois ideology ought to sound even if, in a 'postmodern' age, it must do this by claiming to be 'traditional'!

A Hindutva by Any Other Name...

How Nandy helps build political Hindutva is most clearly evident in his interventions in the debate over secularism, the chief political and intellectual debate sparked off by the rise of hindutva. Hindutva challenges Indian secularism theoretically and practically, adversely affecting the ability of India's state structures to effectively uphold this constitutional commitment. Secularism in India entails keeping the state impartial not only in its dealings with citizens of diverse faiths but also in those with major religious institutions and practices which are fairly extensive for colonial as well as more broadly historical reasons. Indian constitutional theory also hoped that development, guided by the state, would secularise Indian public life, making these issues less contentious. In practice, of course, the state has not stood up well for these ideals. But it is not because it has leaned over backwards to 'appease' minorities as hindutva and neo-Gandhianism[86] have argued. Rather the mostly legislative instances of this which have been so often been marshalled in evidence, scanty enough as they are, are the high-profile tokenistic counter-examples to the all-too-routine, lamentably unremarkable majoritarianism embedded in the every-day practices of state structures on the ground. As a majoritarian force, pitted against 'special treatment' for minorities, hindutva, helped by neo-Gandhians, gives these counter-examples an unwarranted prominence. Moreover, instead of demanding a more consistent secularism, they argue for various degrees of rejection of it.

Nandy argues, using his 'tradition-modernity' distinction, that the 'modern' phenomenon of hindutva (and Communalism generally) and the modern values of secularism must be seen not "as sworn enemies but as disowned doubles of each other".[87] 'Modern' hindutva is a mercenary, professionalised riot-mongering, based on coldly calculating 'misuse of religion'.[88] This looks like 'opposition' to hindutva only so long as one ignores the fact that even the votaries of hindutva (like, barring perversity, everyone else, one supposes) claims to oppose the instrumental use of religion by religious fanatics as an ideology "protecting non-religious, usually political or socio-economic interests".[89] After all, the mob's destruction of the Babri masjid was, for the BJP, an act of a 'genuine faith' which 'overwhelmed' it, to take only an extreme example. Or to take another, Advani repeatedly disclaimed any responsibility for the riots which so murderously trailed behind his rath yatras . After all he had also been engaged in an act of 'genuine faith' which could not possibly have anything to do with these 'modern' pathologies.

At the same time, Nandy's 'anti-secularism' must also insist that secularism in India has 'gone too far'. Theoretically both Nandy and the BJP promote caricatures of 'western' secularism as the irreligion of 'westernised' elites which would attempt to root out religion from public life completely or would attempt (as Nandy occasionally argues in a more nuanced vein, presumably when he feels better disposed towards these elites) to vainly implant "religious tolerance on the good faith or conscience of a small group of de-ethnicised, middle class politicians, bureaucrats and intellectuals".[90] "[T]he old ideology of secularism" is "not working in India"[91] because secularism is a western concept, unsuited to the Indian genius, whose deep religiosity needs to be publicly and politically expressed: "democratisation itself has put limits on the secularisation of Indian politics. These new entrants ['average Indians' pitted against 'anglo-crats'], coming from what was until recently part of the ethnic 'backwaters' of India, have given Indian democracy its power and resilience".[92]

Between the 'opposition' to 'modern' hindutva and opposition to secularism the claims of actually existing political hindutva are conceded: religion/culture must be part of any acceptable humane and tolerant polity. The implication is clearly majoritarianism, in India, hindutva. And majoritarianism, as always, comes clothed in the rhetoric of democracy. Nandy's views encourage a religious majoritarianism exactly like the BJP's call for Hindu assertion. Both bear on the everyday practices of the Indian state. It is "absurd... [Nandy argues]... that in a democracy people had political rights to choose their rulers but not to bring their cultural selves into the political arena".[93] India's rural hinterland, untouched by modernity, beyond the "reach of modern communications"[94] is populated by those who (presumably like Roop Kanwar's murderers) "refuse to be placated by the fact that they have democratic rights; they want to exercise the right to protect or actualise their diverse visions of a free society... To the majority of Indians, freedom seems inseparable from participatory democracy."[95] And anti-secularism licenses the 'religious' sources of majoritarian hindutva's content, while also enabling an attack on the very idea of secularism in the name of "'true' religion and 'true' culture which...[are]... definitionally tolerant of the other religions and cultures"[96] and contrary to the 'western' concept of secularism, can be a force for good. Like hindutva, Nandy alleges that Indian secularism has failed to promote good inter-community relations precisely because of its excesses. Neither particularly distinguished for consistency, both would also claim to be 'secular' if secularism means the religious tolerance which is inherent in all 'true' religion.

Needless to say, Nandy's native sympathies with hindutva are not always

filtered through the 'traditional/modern' dichotomy. They often reveal themselves in grimmer, less processed forms as when he argues that even the wilder forms of hindutva, which he would otherwise condemn, are unfortunate but understandable reactions to the excesses of secularism. "Many distorted or perverted versions of religion circulating in modern or semi-modern India owe their origins to this perception of the triumph of secularisation, rather than to the persistence of traditions".[97] These justifications sound like nothing so much as swaggering threats of Hindu nationalist retaliation against secularism: "If the religious way of life cannot find a normal play in public life, it finds distorted expression in fundamentalism, revivalism and xenophobia".[98] Such broadly political majoritarian assertion now openly licenses the hitherto shame-faced discriminatory practices of the Indian state against minorities (including lower castes). They are arguably more effectively repressive than most laws which the Indian state, given its enforcement record, may choose to enact, even under a BJP dispensation. Ramshackle fascisms, like that of inter-war Italy, are also just as murderous, if more haphazardly so. The possibilities of legislative assimilationism look, in any case, rather dubious. Hindutva's charge that Indian secularism is a 'pseudo-secularism', primarily 'appeasing minorities', drew substance particularly from the infamous Shah Bano controversy. When fundamentalist Muslim opposition to a Supreme Court judgment giving divorced Muslim women (minimal) maintenance led a spineless Congress government under Rajiv Gandhi to enact legislation nullifying the effect of the judgment, it was held up as paradigmatic of the 'secularism' of the Indian state and 'secular' liberal and left currents. This anti-minorityism seemed, rather improbably, to associate hindutva with a 'genuine secularism'. Nandy's attack on this 'modern' pose of hindutva – "I accept the self-definition of the genuine secularists simply because their world is entirely secular. They use religion rationally, dispassionately, and instrumentally, untouched by any theory of transcendence. They genuinely cannot or do no grant any intrinsic sanctity to the faith of even their own followers"[99] - reminds hindutva that its cache of credibility, religion, cannot be abandoned but at its own peril. In practical terms this position came to refer to hindutva's long-standing majoritarian demand for a uniform civil code replacing the maze of 'personal codes' which presently govern family matters such as inheritance, marriage, divorce, adoption, etc, for each major 'religious community' (and as such form the legal mainstay of Indian patriarchy). It is feared that if enacted, this would essentially mean an imposition of the majority personal code upon the minorities. But this may be a position which political hindutva may in any case have to evacuate. Nandy clearly sees why: This sort of assimilationism might turn out to be no different from secularism. Under both, quite apart from the certainty that the minorities would be forced to give up at least important aspects of their 'religious' practices, "what is in store for the... minorities in the long run is no different from what is in store for the... majority in the long run. Both become objects of social engineering and both face cultural extinction."[100] Quite. The right's culturalist strategies would be impossible without particularity: indeed, for it, culture is particularity. Political hindutva is much better off claiming that "India is secular because it is Hindu". Much like western multi-culturalism, it is an assertion of "respect for the Other's specificity [as] the very form of asserting one's own superiority".[101] Moreover, leading feminists and women's groups have raised uncomfortable questions about gender justice to whose appeal, given the rather glaring gender discrimination embedded in Indian law, even the BJP's own female constituency may not be immune. They must be discussed if any legislation in this area is to be contemplated at all.[102] However, the class which hindutva seeks to represent needs only an anti-statist rhetoric to avoid having to account for its 'traditional' patriarchal practices, which are actively part of both accumulation and cultural entrepreneurship, not an overbearing state to 'reform' them – religiously or secularly!

Below the surface of the diverting shadowboxing between 'modern' hindutva and 'true' 'tradition' or 'religion' lie the other services Nandy performs for hindutva – constructing a Hindu, brahminical and irrationalist identity of India's bourgeois ruling class and defining the modes of its authority. The Indian bourgeoisie is, after all, the chief object of Nandy's discourse. He has "focused on middle-class consciousness in South Asia and tried to locate the basis of the global mass culture in societies that have rich cultural traditions of another kind".[103] In doing so he reconfigures this bourgeoisie's boundaries. Practically all of Nandy's psychologistic writing – whether it purports to be about science or terrorism – is actually about the kind of self his bourgeois audience should have (which is why he sounds so much like another Indian guru, selling his own brand of Karma-Cola). Nandy exhorts the bourgeoisie to move from one (old,' modern' and secular) self to another (new, 'traditional' and religious). The 'old' identity of the middle class, the skin which it must shed, so to speak, is the urban westernised English-speaking middle class, with statist, developmentalist, liberal and socialist proclivities in short, with 'colonised' minds. In contrast to them, he speaks on behalf of the 'average Indian' who is no less than the above average (high-caste, brahminical, bourgeois) Hindu!

For Nandy collapses the Indian into the Hindu. Exploiting the advantages which the dominant western orientalist and anti-Semitic (in the Indian context, anti-Islamic) discourse have long given to Hinduism (today enjoyed also by hindutva), Nandy sees Hinduism as containing and being open to the most diverse impulses. It is therefore tolerant, flexible while Islam, by contrast, is inherently intolerant. (And he asks, how can an intolerant proselytising faith co-exist with a 'tolerant' one?[104] Part of Nandy's objection to received 'modern' hindutva is that it aims to 'Semitise' and modernise Hinduism, making it "monolithic, well-organised and capable of being a sustaining ideology for an imperious state.")[105] When Nandy makes an exception of Indian Islam, it is only by considering it as an essentially 'Hindu' faith because the common frame of that composite of cultures – Indian civilisation – is Hindu. Sweet music to political hindutva's ears! The consequences are not hard to draw: while we may not be required to say 'with pride' that we are Hindus (as hindutva currently demands), we may be asked to say equally aggressively that we are Indian or Bharatiya with substantially the same disagreeable consequences.

The content of this new 'Indian' identity is not only Hindu, but brahminical. And in its modern form, as constructed by the comprador brahmin colonial elites, and as refashioned by Gandhi, brahminism, which also derives from Orientalist frameworks, is all the easier to infuse with the irrationalist content characteristic of authoritarian tendencies generally. Although the advocacy of caution is perhaps the 'rational' kernel of conservatism as the 'Philosophy of Imperfection',[106] for the most part, conservatism has always been allied with forms of irrationalism (purportedly "to reflect the irrational order of creation"[107]), reaching gruesome heights in European fascism with the

elevation of irrationalism to the status of a political absolute in 'decisionism'.[108] Nandy's irrationalism lies in the notion of 'critical traditionalism' in which not only is the adjective redundant, as we have seen, but in line with modern brahminism, 'Indian tradition' is simply opposed to rationality. For the "linear evolutionary inclusive homogenisation" of the actually conflictual 'Hindu' history, had featured the challenges to it throughout its history as (appropriated) moments internal to the tradition. The 'Hindu' tradition was now constructed as "a syncretic all-encompassing absorber of multiple impulses, a sponge that could absorb anything and yet retain its core....[constituting] an Indian mind that abounds in contradictions, ignores canons of logic and the rules of cause and effect and labels and categorises things without going on to search for analytical explanations".[109] The "vagueness, chaos, deliberate obfuscation and inability to close up conceptual boundaries" which characterise the 'traditional Indian' mind[110] as conceived along the same brahminical lines by Nandy provides the concrete content of the irrationalism of his political hindutva. This irrationalism dispenses with any need to impose impossible standards of piety or cultural conformity among hindutva's public figures, and invests them with a staggering amount of discretion, including on the question of what does and does not constitute 'Indianness'. Any updated and revised hindutva should also be free from the accusation of its being another persecuting 'ideology' or metanarrative and the 'traditional' intellectual style which Nandy attributes to this conception of 'Indian' tradition also serves this purpose well: 'non-modern' intellectuals accept eternal verities and seek only to interpret and enrich them, eschewing utopias as forms of social engineering or conceptions of 'error' as instruments of prosecution.[111] Although tradition is also 'totalist, Nandy minimises its dangers by claiming that this totalism was 'Sisyphean'...informed by a touch of futileness'.[112] Nandy's 'critical traditionalism' is nothing less than the dark secret of all reactionary authoritarian ideologies, unaccountable power with a 'totalist' scope.

Conceptions of identity govern group membership and Nandy makes sure to accommodate the bourgeoisie's new elements. The 'average Indian' – traditional, rural, vernacular and beyond statist, developmentalist or socialist sophistry, is now 'a strong minority...a very sizeable presence'[113] who is also, he has suggested, 'Bharat' versus 'India'.[114] This obviously caters to the numerically most important segment of the Indian bourgeoisie. Not so much an 'agrarian bourgeoisie', having a common interest against urban, modern, westernised India, as a provincial propertied class, its spokesmen and women are nevertheless "most vocal about injustice done to 'villages'.... in the staff rooms of our provincial universities".[115] But their conversion into a provincial propertied class objectively resolves much of the more extreme intra-bourgeois frictions – opposition of agrarian and industrial interests – and by assimilating them to itself political hindutva can now deploy their rustic rhetoric less as a demand against industrial and urban segments and more as a myth of agrarian 'traditional' origins. This populism views the 'traditional' village, much like Nandy, as a harmonious organic whole, without exploiters or exploited and can serve as the chief myth of the authoritarian nation, delegitimising cleavages within it while remaining, like all populisms and the economic interests they speak for, within the framework of the capitalism into which their constituencies are deeply imbricated. Finally, given the largely cultural definition of 'Indianness', membership of the nation, according to political hindutva is no longer a matter of citizenship and has an important global or diasporic dimension. While Non Resident Indians (NRIs) who retain their Indian identity because "they resent the idea of merging into the mainstream"[116] can now be considered more or less Indian, certain sections of the nation – liberal, socialist or feminist, that is to say 'unindian' and 'westernised' – can be othered as 'resident non-Indians'.

The psychology of the transition from the old to the new bourgeois identity according to Nandy is especially revealing: the modern self is adult, masculine, intolerant and rational, culpable in the destruction of cultures and environments. The 'traditional self' is childlike, feminine, tolerant, innocent and non-rational. The latter must be revalued, as Gandhi did, and owned up to. This is 'true' adulthood. But rather than a reversion to childhood, it is a graduation to "the 'authentic innocence' psychoanalyst Rollo May speaks about, the innocence which includes the vulnerability of a child but which has not lost the realism of its perception of evil or that of its own 'complicity' with that evil".[117] This makes nice work out of the uncomfortable questions all the harping on 'tradition' could raise for a bourgeoisie as zealously consumerist and jealously protective of its modern conveniences and comforts as they come. No strenuous renunciation of these modern 'evils' is necessary. Rather, the bourgeoisie can contemplate them, and its own complicity with them, as the steps it mounts towards more or less angst-ridden 'authentic innocence'! The psychodrama also accepts that, so long as the new 'traditional' self remains in control, even vehemently despised aspects of the old self need not be eliminated, only subordinated – they are bound, presumably, to be of some use: Nandy's opposition to the whole range of his 'modern' targets – science, rationality, history, development, the state and so on – is therefore frequently expressed in the way of a magnanimously knowing indulgence of juvenile folly.

Finally, aware that '[n]o hegemony is complete unless the predictability of dissent is ensured and that cannot be done unless powerful criteria are set up to decide what is authentic, sane, [now ir-]rational dissent'.[118] Nandy does not stint from offering political hindutva an eminently serviceable set of such criteria with which to both 'predict' and 'control' it.[119] The predictable and therefore acceptable forms of dissent, 'genuine' dissent, is autochthonous, unaided by inauthentic forces, ideologies and monies. It is childlike, individual, isolated, hopelessly incompetent and ultimately unable to act against the elites. Nandy's essay on the terrorism of the early 1980s elaborates on this: the 'genuine' terrorist is typically a raw youth with barely the beginnings of a beard, pathetically ignorant of modern weaponry, desperately committed to heroic action in the service of the cause. He may hijack a plane, shockingly underequipped though he may be, through the sheer force of devotion, will and a native ingenuity. But then he melts when confronted with his real victims: bringing milk and biscuits for the kids and refreshments for the ladies, pleading for understanding of his cause. In the end, everyone is released unharmed though the self-aggrandising state deals too roughly with the poor fellow. With such dissent, it would seem, a hijacking is an event in which great fun is had by (almost) all! It is possible, at one level, to recognise here the need of the Indian bourgeoisie to believe that despite the grinding poverty of millions in India, despite the disappearance of the structures of reciprocal obligation which once can be said to have bound oppressor and oppressor in a bond of some minimal legitimacy, that 'they' are actually post-colonial Gungadins who wouldn't harm us (and couldn't, even if they wanted to) unless provoked and armed by 'outside' elements and provocateurs. And this is the point, since this is 'genuine' dissent, everything which does not fit this picture is not genuine, is provoked by outside (non-

Indian) elements and must be dealt with firmly. What could these be?

One need not read too much of Nandy before one encounters his numerous attacks on the ideology of Nehruvian developmentalism, liberalism and socialism construed as the 'anti-people' ideologies of 'unindian', 'over-westernised', 'secularist', 'socialist', 'liberal', elites. These attacks can be shockingly venomous: Not satisfied with dismissing the Left as "a letdown – often even pathetic",[120] Nandy attacks it, as well as all liberals, secularists and socialists for being 'eager to fight [*sic*] the cause of Secularism to the last Muslim or Sikh' because they not only have an 'irrational commitment to rationality' but also harbour 'a certain glee at the persistence of religious belligerency'![121] His declared aim is to save India from the clutches of such elites which, like most other southern countries, it had the ill fortune to fall into upon independence, missing the opportunity to realise its authentic traditional culture. Politics cannot be governed by these elites any longer. It has 'become the real pace-setting system'.[122] They should no longer be allowed to claim that "working among the tribals and the rural poor ...[is] .. romantic Gandhian obscurantism....ethnic demands [are] identified with fundamentalism, and all peasant movements...the self-assertion of Kulaks".[123] Thus owning a certain type of dissent and disowning another, India can be made safe for participatory (cadre and lumpen mobilising), 'traditional' (brahminical and irrationalist) cultural (religious, anti-secular), democratic (majoritarian) politics suited to India's "chaotic political reality".[124]

Notes

[Parts of this paper were synoptically presented at the International Conference on South Asia, 'India and Pakistan 50 Years of Independence. Assessment and Prospects', Carleton University, Ottawa, August 1997 and appeared as "The Intimacies and the Enmities Shades of Saffron in Ashis Nandy" in Reeta Tremblay et al (eds), *Interfacing Nations*, B R Publications, New Delhi, 1998 Others, concerning the understanding of the Hindu Nationalism in modern Indian politics and history for a book on the subject, were presented at the European Association of South Asian Studies Conference in Prague in September 1998.

I would like to express my deep gratitude to Jayant Lele. It will be obvious that the argument below relies significantly on his path-breaking, and still ongoing interpretation of hindutva Having also benefited from his friendship, encouragement and conversation over the years, my responsibility for the flaws which undoubtedly remain will be even heavier. I would also like to thank Chris Schimmele for his help with a part of the research.]

1 Theories and ideas about culture which conceptualise it as disembodied rather than incarnated in society's material – productive and reproductive – processes are culturalist. They now far exceed any reaction to "vulgar materialism" and thrive in ever closer symbiosis with the long-standing idealist traditions of the dominant culture whose sophomoric "cultural determinism" they reinforce with pseudo-radical terminology.

6 Modern parties of the right, parties of the propertied few, have not only had to resort to complex ideological and organisational ruses and devices in what Andrew Gamble called their "politics of support" (*The Conservative Nation*, Routledge and Kegan Paul, London, 1974), but are also complex coalitions of different kinds of property and capital The class of small property being the only genuinely popular element in this coalition, the maintenance of the coalition requires that its interests be harmonised with those of big capital. It is possible to argue that the current turbulent phase in the evolution of parties of the right, particularly in advanced capitalist countries, is precisely due to the lack of such harmonisation and the emergence of various populist revolts

7 It was already apparent in the mid-1980s heyday of Thatcherism as I show in 'Second Hand Dealers in Ideas: Think-Tanks and Thatcherite Hegemony', *New Left Review* 203, January-February 1997, pp 58-59. See also Andrew Gamble's pithy dissection of the pre- and post-Thatcherite discourses in the party in "The Entrails of Thatcherism", *New Left Review* 198, March-April 1993.

8 The literature here is too extensive to be cited fully and includes liberals as well as various sorts of socialists. Feminist critiques of both postmodern and post-structuralist currents and their feminist variants have also been notable. One can only provide a select and necessarily subjective list. Juergen Habermas, *The Philosophical Discourse of Modernity*, MIT Press, Cambridge, Mass, 1987; Peter Dews, *Logics of Disintegration*, Verso, London, 1987. Aijaz Ahmad, *In Theory: Nations Classes and Literatures*, Verso, London, 1992, Christopher Norris, *The Truth about Postmodernism*, Blackwell, Oxford, 1993 For feminist critiques,, see Sabina Lovibond, 'Feminism and Postmodernism' and 'Feminism and the 'Crisis of Rationality'' in *New Left Review* 178 and 207, November December 1989 and September-October 1994, Nancy Fraser, *Unruly Practices*, University of Minnesota Press, Minneapolis, 1989, Somer Brodribb, *Nothing Ma(t)ters*, Spinifex Press, North Melbourne, 1992, Theresa Ebert, *Ludic Feminism and After*, University of Michigan Press, Ann Arbor, 1995.

10 Nancy Fraser, 'Recognition and Redistribution', *New Left Review*, *217*, July-August 1995.

11 Boris Frankel has recently examined the explicit endorsement by the anti-socialist culturalist 'radical' journal Telos, of the principal themes of the neo-fascist populism of the Extreme Right, such as the French National Front and Italy's Lega Nord ('Confronting Neo-liberal Regimes: The Post-Marxist Embrace of Populism and Realpolitik', *New Left Review*, 226, November-December 1997).

12 A common admiration for the Nazi jurist Carl Schmitt's theories of "the political" unites Telos and the democratic theorist Chantal Mouffe. I have examined the seriously anti-democratic consequences of Schmitt's assertion of axiomatically irreduceable cultural difference, a form of irrationalism, when imported into a theory of democracy, however well-intentioned. 'Fetishizing Phantoms: Carl Schmitt, Chantal Mouffe and 'the Political' in Abbie Bakan and Eleanor MacDonald (eds), *Critical Political Studies: Debates and Dialogues from the Left*, James Currey, Forthcoming.

13 See Martin Barker, *The New Racism*, Junction Books, London, 1981.

14 Whatever the future may hold, for the moment the 'Left' in India still denotes the Communist Party of India (Marxist), CPI(M), the leading party of the left in India, the Communist Party of India (CPI) and other left parties and groups which the CPI(M) leads, in contrast to the necessarily looser usage of the terms now necessary in countries without such a political left.

15 See, for example, David Hardiman's account of this ideological process in Kheda, District, one of the most successful regions of Gandhian mobilisation. ('The Crisis of the Lesser Patidars' in David Low, (ed) *Congress and the Raj*, Heinemann, London, 1977.)

16 There are differences, of course, between Gandhi and the neo-Gandhians which are politically and morally important. It is to Gandhi's eternal credit that he stood, literally physically, by his protestations for Hindu-Muslim unity. However, this should not obscure affinities between his thought and Hindu nationalism, something which could be exploited later by much less scrupulous neo-Gandhians while basking in the reflected glory of his sacrifices. See Richard Fox, 'Gandhian Socialism and Hindu Nationalism' in Sugata Bose (ed), *South Asia and World Capitalism*, Oxford University Press, Oxford, 1990 and P C Upadhyaya, 'The Politics of Indian Secularism', *Modern Asian Studies*, Vol 26, October 1992.

17 See, for example, Jan Bremen, 'Mobilisation of Landless Labourers' in A R Desai (ed), *Agrarian Struggles in India after Independence*, Oxford University Press, Bombay, 1986.

18 See Partha Chatterjee, 'Gandhi and the Critique of Civil Society' in R Guha (ed), *Subaltern Studies III*, Oxford University Press, New Delhi, 1984 and Ashis Nandy, "From Outside the Imperium: Gandhi's Cultural Critique of the West', *Alternatives*, Volume Seven, Number Two (Fall 1981).

19 The preoccupation of Partha Chatterjee's work on Indian nationalism is precisely with the question of whether modern Indian intellectual life, inevitably fitted under the rubric of "nationalism" as the current 'post-colonial' fashion demands, is 'derivative' of western enlightenment discourse. The exceedingly contrived argument placing Gandhi 'outside' the enlightenment is the core of the argument that this strand of nationalist thought, at least, was not. *Nationalist Thought and the Colonial World: A Derivative Discourse*, Zed Books, London, 1986.

20 While Sudipta Kaviraj in his famous essay, 'Critique of the Passive Revolution' (*Economic and Political Weekly*, Special Number, November, 1988) places the responsibility for it squarely in the bureaucratisation of the Indian state, a 'modern', Nehruvian phenomenon, it is at least debatable whether it actually did not lie in the profoundly conservative nature of Gandhi's thought and the elitist nature of his political practice where Gandhi routinely substituted his own agency for that of 'the people', and reinforced local patterns of dominance through his mobilisations. Seen this way, the passivity was originally Gandhian, though it may also have had its Nehruvian forms. *Subaltern Studies* history, and in particular the work of Partha Chatterjee, probably the most intellectually sophisticated strand of this type of discourse, has further elaborated this particularly uncritical stance towards Gandhi.

21 Information in the next few paragraphs has been gleaned from D L Sheth and Ashis Nandy, 'Introduction' in Sheth and Nandy (eds) *The Multiverse of Democracy: Essays in Honour of Rajni Kothari*, Sage, New Delhi, 1996, Centre for the Study of Developing Societies, Research Report, 1964-1974, New Delhi; Saul Mendelovitz, 'Introduction' in Jagdish Bhagwati (ed) *Economics and World Order from the 1970s to the 1990s*, Macmillan in association with the World Order Models Project, London 1972, 'Message from Ashis Nandy (fwd) from Sohail Inayatullah',Http://www.scu edu.au/lists/futures-l 1225.html (hereafter Inayatullah); the *Alternatives* Main Page, Http://www.rienner.com/alt.htm , and a perusal of the back issues of *Alternatives*. 51 CFST:AC, p 115

52 ANVL, p 62

53 For an early and prescient account of this pattern see A R Kamat, 'The Emerging Situation A Socio-Structural Analysis', *Economic and Political Weekly*, Annual Number 1978 Robert Stern's lively account of modern Indian history whose primary focus is on this theme what he calls the shift in India's bourgeois revolution ('the development together of capitalism and parliamentary democracy') from being 'top-down' to being 'Middle-Up' may, however, be a little sanguine about its political implications (*Changing India Bourgeois Revolution on the Subcontinent*, Cambridge University Press, New Delhi, 1993)

54 Whatever its implications for the debates about the potential for capitalist development in pre-colonial India which have plagued, even among Marxists, by an almost Weberian European exceptionalism, recent historiography is beginning to delve into the deep roots the bourgeoisie has in Indian history It is not a creation of colonialism. See particularly, Burton Stein, "Towards an Indian Petty Bourgeoisie: Outline of an Approach", *Economic and Political Weekly*, January 26, 1991 and Chris Bayly, *Rulers Townsmen and Bazaars*, Cambridge University Press, Cambridge, 1983. Its development through the colonial period certainly accelerated, though it will remain a matter of debate if it might have been faster still without foreign rule. By the 1930s big business had emerged as a weighty interest in Congress and that meant that unlike many other third world countries, the dynamics of independent India could not be explained by the Kaleckian idea of "Intermediate Regimes" based on the lower middle class and peasants whose politics were potentially far more radical than the Indian record See K N Raj, "The Politics and Economics of Intermediate Regimes" *Economic and Political Weekly*, July 7, 1973 and E M S Namboodiripad, "On Intermediate Regimes", *Economic and Political Weekly*, December 1, 1973 Aijaz Ahmad in 'Class, Nation and State. Intermediate Classes in Peripheral Societies' (Dale Johnson (ed) *Middle Classes in Dependent Countries*, Sage, Beverly Hills, 1985, reprinted in Lineages of the Present, Tulika, Delhi, 1995) also notes this Indian exceptionality in a survey of the more radical middle class political dynamics in countries of west Asia and North Africa

55 Possibly the most comprehensive case for the argument is Francine Frankel's India's Political Economy 1947-77: The Gradual Revolution, Princeton University Press, Princeton, 1978.

56 It was surely an effect of the Cold War hostility to any state-led (and, one must add, non-aligned) developmentalism, however capitalist, that the most prevalent stereotypes of India's development pattern and class structure focused on a "westernised" intellectual elite with "socialist" leanings. In fact, such intellectuals were, at best unwillingly, the footmen of the progress of Indian capitalism, although they, lead by the Left, have played a central role in the task of keeping India's liberal institutions as honest as possible (Aijaz Ahmad, 'In the Eye of the Storm' The Left Chooses', *Economic and Political Weekly*, June 1, 1996). The subsequent utility of this stereotype as a harangue against this developmentalism and the Left, upon the defeat of communism worldswide and exhaustion of statism's potential for capitalist growth and the ruling class's inclination to be even minimally welfarist, is amply evident below. Sudipta Kaviraj has made perhaps the strongest case for including this group as one of three major elements of the ruling coalition in India. See his 'A Critique of the Passive Revolution', *Economic and Political Weekly*, Special Number, November, 1988.

73 Lele, *Hindutva*, p 90

74 See, for example, T V Satyamurthy, 'The Impact of Centre-State Relations on Indian Politics An Interpretive Reckoning 1947-1987' in P Chatterjee (ed) *State and Politics in India*, Oxford University Press, Delhi, 1997

75 Utsa Patnaik and Zoya Hasan, 'Aspects of Farmers' Movements in Uttar Pradesh in the Context of Uneven Capitalist Development in Indian Agriculture' in T V Satyamurthy (ed) *Industry and Agriculture in India Since Independence*, Oxford University Press, New Delhi, 1995

76 Tapan Basu et al, *Khaki Shorts and Saffron Flags*, Orient Longman, Delhi, 1993 is a good example. The roots of modern hindutva in the 1920s and the many parallels between it and European fascism of the time (cadres, violent and repeated mobilisations, anti-socialism, appeals to a mythic past, the list can be lengthened) have inevitably raised the question of whether it is 'fascist' or not. The prima facie evidence which Aijaz Ahmad has vividly assembled in 'On the Ruins of Ayodhya' (*Lineages of the Present*, Tulika, Delhi, 1995, pp 270-74) is certainly overwhelming. Achin Vanaik's lengthy response to him and others on this score ('Situating the Threat of Hindu Nationalism: Problems with the Fascist Paradigm' *Economic and Political Weekly*, Vol XXIX, no 28, July 9, 1994), while erudite and informative, seems ultimately schematic, with the implication that no two historical conjunctures being exactly alike, historical study of politics can only be a series of idiographies. While the decision to call hindutva 'fascist' may be ultimately a political one, it is clear that hindutva represents an extremely authoritarian and irrationalist form of politics and comparison is important not least because detailed examination of the two historical contexts yield clues about its nature and dynamics.

80 ANVL, p 15.

81 CFST.AC, p 121.

82 The value of this sociological distinction, in which modernity is essentially the spread of a reason collapsed into instrumental rationality, to critical social theory always been dubious. At its Weberian origins, it issued into a despair at the dehumanising rationalising tendencies of 'modernity' which debilitated his liberalism, despite his intense desire to remain a critic of Enlightenment from within (Wolfgang Mommsen, 'Max Weber's Political Sociology and his Philosophy of World History', *International Social Science Journal*, Vol XVII, no 1, 1965, p 36.) A major intellectual achievement of early dependency theory was precisely to riddle this distinction, as it was mobilised by the sociology of modernisation, with many of its most deserved holes (Andre Gunder Frank, 'Sociology of Development, Underdevelopment of Sociology' in *Latin America: Underdevelopment or Revolution*? Monthly Review Press, New York, 1974). Today, because most scholars fail to sufficiently credit the fact that the histories of both pre-capitalist and capitalist societies have been propelled by the interaction of their dominant and critical cultures (See Jayant Lele, *Tradition and Modernity in Bhakti* Movements, E J Brill, Leiden, 1981) it is one of the most effective weapons in the cultural nationalist conceptual armoury worldwide.

83 Arno Mayer's *Why Did the Heavens not Darken*? (Pantheon, New York, 1990) provides antidotes to many caricatures of Nazism arguing that its anti-semitism was not qualitatively different from the medieval though it may have had more powerful technological means at its disposal, that it was, like most other racisms, exploitative rather than exterminist towards all its victims and that, it was primarily an anti-socialist/communist movement.

84 Ashis Nandy, 'The Politics of Secularism and the Recovery of Religious Tolerance' in *Alternatives*, Vol XIII, 1988 (hereafter PSRRT), p 178.

85 Nikki Keddie's, 'Secularism and the State Towards Clarity and Global Comparison' (*New Left Review* 226, November-December 1997) laudably demonstrates the diversity of ideological and political formations included under the rubric of 'fundamentalism', diversities which arise less from the differences between religions than from the varying social bases and political conjunctures in which these movements arise.

Estimating Infant Mortality in Kerala

S Irudaya Rajan
P Mohanachandran

Kerala has recorded declining infant mortality, a high stillbirth rate and a high proportion of infant deaths below one week. This presents a paradox which needs careful investigation.

AS of 1996, Kerala's infant mortality rate was estimated to be 14 for both males and females as per the Sample Registration System (SRS) provided by the registrar general of India, ministry of home affairs, government of India, New Delhi. Using the above statistics, many social scientists and organisations assess the health situation and quality of life of Indian population. For instance, the Population Foundation of India (1998), in its recently released publication titled *State of India's Population* presents most recent information on the levels of fertility, mortality and reproductive health and combining them into indices such as human development index (HDI), gender related health index (GHI) and reproductive health index (RHI).

The HDI has been computed by giving equal weights to three component indices: expectation of life at birth, adult literacy rate and per capita state domestic product. The index for Kerala is 63 as of 1995, the highest among major states and the lowest is reported for Bihar. GHI uses the same variables as HDI and attempts to capture the achievements in narrowing gender differentials through the same set of capabilities. As of 1995, the index for Kerala is 89, the highest among major states and the lowest is reported for Madhya Pradesh. The RHI developed by the Population Foundation of India, takes into account the following variables: total fertility rate, perinatal mortality rate, educational level, type of medical attention at birth, birth order, teenage pregnancies measured by age-specific fertility rate of women aged 15-19 and contraceptive protection rate due to sterilisation. The index for Kerala is 80 as of 1995, the highest among major states and the lowest is reported for Uttar Pradesh [Population Foundation of India 1998]. Though the above three indices rank Kerala as the number one state, the last runner for each index varies considerably; HDI for Bihar, GHI for Madhya Pradesh and RHI for Uttar Pradesh. Even the physical quality of life index ranks Kerala as the number one state in India [Karkal and Rajan 1991]. Remember, all these indices heavily depend on infant mortality rate, perinatal mortality rate and expectation of life at birth.

How reliable are the SRS estimates of infant mortality, perinatal mortality, neonatal and post-neonatal mortality for Kerala? The SRS provides annual series on indicators of mortality and fertility. The annual series data on IMR provided by the SRS from 1971 to 1996 are presented in Table 1. Some quick observations can be made. Firstly, a number of fluctuations and inconsistencies in the IMR estimates are noticed throughout the last 25 years. The 1971 SRS reported the IMR for Kerala as 58 whereas the 1972 SRS states the IMR as 63. On an average, the IMR for Kerala for the period 1971-76 was 57 per thousand live births. We also notice a decline of 9 points in IMR between 1976-77 (56 in 1976 and 47 in 1977). During 1977-80, the IMR for Kerala was 43, a decline of 14 points compared to the 1971-76 period. However, during the 1980s and 1990s, IMR values declined further to reach a level of 32 between 1980-85, 24 between 1986-90 and 15 between 1991-96. Between 1986-90 and 1991-96, a decline of 9 points was noticed.

Surprisingly, the contribution of post-neonatal mortality (28 days to 365 days) to the decline of IMR is higher than that of neonatal mortality (0-28 days). During 1971-76, 60 per cent of infant deaths occurred within a month whereas the proportion has gone up to 75 per cent during 1991-96. The proportion of children who died after a month and within a year has come down from 40 in 1971-76 to 26 in 1991-96.

Decomposition of one-month infant mortality data into two components such as 0-7 days and 7-28 days, reveals an interesting scenario of health situation of Kerala. It shows that 64 per cent of this group died within a week during 1971-76 and this proportion has gone up to 85 per cent in recent years. It means, simply, that out of 14 children who died in Kerala within one year, 10 died within a week of birth! Thus the infant mortality in Kerala is basically a one-week mortality not a one-year mortality.

Let us now analyse the perinatal mortality and stillbirth rates for Kerala. During 1971-76, the perinatal mortality (one week mortality+stillbirth rate) was around 42 and it declined to 20 during 1991-96. However, the stillbirth rate has declined from 21 to 10 during the same period under investigation. Between 1971-76 and 1991-96, the highest percentage decline was noticed among the post neonatal mortality (83), followed by 7-28 days mortality (66). However, the percentage decline was almost 55 for perinatal mortality, stillbirth and one-week mortality rates in Kerala. It means the health programmes in Kerala will save the children only if they survive at least for a week. The stillbirth rate, perinatal mortality and one-week mortality rates are extremely high compared to the infant mortality rate.

In this context, IMR estimates made for Kerala using the 1991 Census reveal surprisingly, a different story. The registrar general of India (1998) has estimated the IMR for Kerala as 42 per thousand live births whereas as our own estimates put the IMR at 37 [Irudaya Rajan and Mohanachandran 1998]. We also provide IMR estimates for Kerala from various studies carried out in Kerala in Table 2.

During the same period, we published an article 'Long-Term Implications of Low Fertility in Kerala' in *Asia Pacific Population Journal*, a journal published by the United Nations, Economic and Social Commission for Asia and the Pacific (ESCAP), Bangkok, Thailand [Irudaya Rajan and Zachariah 1998]. During the correspondence, Nibhon Debavalya, director, population division, ESCAP, United Nations, queried the senior author (May 29, 1998): "Is the IMR really as low as 16? The decline in mortality between the period 1981-91 and 1991-96 seems unrealistic." The same view was expressed by K Srinivasan, executive director, Population Foundation of India as early as 1996 during my presentation on infant mortality in Kerala [Irudaya Rajan 1996]. Numerous scholars have worked on Kerala's demography at various points of time, specially during the 1980s and 1990s [Srinivasan 1995; Zachariah 1998]. We have also not investigated this peculiar phenomenon in our recent work [Zachariah and Irudaya Rajan 1997a; 1997b], however, diverging opinions on implication of fertility transition have also been presented in the publication [Kurup 1997; Mishra and Irudaya Rajan 1997].

This brief note has two objectives: Firstly, to explore the possible reasons of high stillbirth rate and perinatal mortality in Kerala, secondly, why the SRS under-

estimates the IMR as low as 14? In the process, we also assess the reasons for high infant mortality rate (37 in 1991) in Kerala as revealed using the census data [more details on the methodology and results for all districts of India, see Irudaya Rajan and Mohanachandran 1998].

Let us discuss the basic structure of the SRS in Kerala. The SRS in Kerala is being implemented through two different agencies; rural areas are covered by the Directorate of Economics and Statistics whereas urban areas are by the Directorate of Census Operations. The investigator appointed for this purpose visits the sample unit once in six months. However, he is supported by a local enumerator (mostly retired government servants with nominal remuneration) to collect the birth, death and other relevant information for every month. If the recorded events do not tally, spot checks are made. Sample units are replaced once in 10 years.

According to published information, the rural SRS is conducted among 150 sample units covering approximately 150-200 households with a population size varying between 1,500 to 2,000 in each sample unit. The urban SRS is conducted as per the rules of the rural SRS, but the sample units are limited to 100. In 1994, the SRS was conducted in 250 sample units covering 3,27,000 persons in the sample. If we use the above information and also the information on birth and infant mortality and stillbirth rates, the following facts are available from the SRS.

During the year 1994, only 5,690 births occurred among the 250 sample units in Kerala. Among them, 91 died before they celebrated their first birthday. Even if we assume one infant death in every sample unit, 159 sample units reported no infant death in 1994. Among the 91 who died before one year, 61 died in a week or 72 died in a month. There were 56 stillbirths reported in the SRS units in 1994. Using the 91 infant deaths among 5,690 births, the SRS provides estimates for Kerala as a whole. As the IMR is becoming a rare event in Kerala, is the SRS sample size good enough to provide estimates for Kerala? This is a serious question that needs to be discussed.

The registrar general of India initiated a sample registration of births and deaths in India on a full scale during 1969-70, to provide reliable estimates of fertility and mortality in the absence of dependable vital rates from the civil registration system. It is high time perhaps for Kerala to take a lead in abandoning the SRS and strengthen the civil registration system. In fact, SRS itself reports that 95 per cent of births occurred in the medical institutions in Kerala which means they

TABLE 1: INFANT MORTALITY BY DIFFERENT COMPONENTS, KERALA, 1971-96

Year	PMR	SBR	OWM	OWOM	NMR	PNMR	IMR

Notes: Compiled by the authors from various issues of *Sample Registration System* and bulletins.
PMR refers to perinatal mortality rate and defined as number of stillbirths and infant deaths of less than seven days during the year divided by number of live births and stillbirths during the year multiplied by 1000.
SBR refers to stillbirth rate and defined as number of stillbirths during the year divided by number of live births and stillbirths during the year multiplied by 1000;
OWM refers to one-week mortality (0-seven days mortality) and defined as number of infant deaths of less than one week during the year divided by number of live births during the year multiplied by 1000.
OWOM refers to one week to one month mortality (7-28 days mortality) and defined as number of infant deaths of more than one week and less than a month during the year divided by number of live births during the year multiplied by 1000
NMR refers to neonatal mortality rate (0-28 days mortality) and defined as number of infant deaths of less than a month during the year divided by number of live births during the year multiplied by 1000
PNMR refers to post-neonatal mortality rate (28 days to one year) and defined as number of infant deaths of more than a month and less than a year during the year divided by number of live births during the year multiplied by 1000.
IMR refers to infant mortality rate and defined as number of infant deaths during the year divided by number of live births during the year multiplied by 1000.

are automatically registered in the civil registers.

Even if one were to accept that the IMR provided for Kerala by SRS is correct, stillbirth rates and perinatal mortality rates are extremely high. According to the 1994 SRS, Kerala's IMR was 16, the lowest among major states in India. The next lowest IMR was reported for Punjab with 53, at least three times higher than Kerala values; that is, Kerala's IMR was lower by 37 points (more details see Table 3). However, the one week mortality rates for Kerala and Punjab were 11 and 18 respectively. In other words, in the one week mortality, Kerala could lead Punjab only by 7 points compared to the lead it had for IMR (37 points). However, Kerala loses its first rank as well as outlier status in stillbirth rate.

According to the 1994 SRS, Bihar, Rajasthan and Uttar Pradesh have lower stillbirth rates than Kerala. In fact, Kerala is above the all-India average. Andhra Pradesh, Assam, Gujarat have the same values as Kerala. Kerala has failed to reduce stillbirths compared to other states (more details, see Table 3). Kerala's stillbirth rate and one-week mortality rates indicate serious problems with the maternal and child health (MCH) programme, particularly the 'M' part. Here is another paradox in Kerala: low IMR, high stillbirth and one-week mortality.

A recent study by Mohanachandran et al (1998) using the National Family Health Survey (1992-93) indicates that most of the maternal care programmes (such as antenatal check up and tetanus injection during pregnancy) and infant and child survival were found to be highly correlated. However, maternal care programmes could not improve the infant survival, specially in the neonatal period. Thus the authors suggest that greater attention be given to maternal care programmes to improve the survival chances of new born infants [Mohanachandran, Chandran and Sabu 1998].

As stated, almost 95 per cent of women delivered their babies in public and private medical institutions as of 1994 in Kerala and another 3 per cent of women delivered their babies at home under the supervision of the qualified medical practitioners. Other studies conducted in Kerala also support the above information [Zachariah et al 1998] However, these percentages were 33 and 30 respectively in 1971 (more details, see Table 4). We have also some suspicion about stillbirth and one-week mortality rate in this context. As most of the maternal and child care institutions are called 'baby friendly' in Kerala, and much emphasis is given to preventing infant mortality, some deaths which occurred immediately after the birth probably classified as 'stillbirth' by the medical practitioners deliberately. In a seminar in 1996, it was pointed out that the increasing proportion of stillbirths was due to wrong reporting of early infant deaths [Irudaya Rajan and Mishra 1997]. Added to this, SRS may be capturing the number of births which occurred in Kerala more accurately and the infants' deaths are not reported properly. However, Mari Bhat (1996) argues that the SRS had significantly underestimated the intercensal growth in population as it was undercounting more births than deaths. For instance, some households in Kerala, bury their infant dead children within the home itself. Children who die within a year are not given importance in the SRS.

Adding to the high stillbirth and one-week mortality, another very disturbing factor in Kerala is the low birth weight. As of today, on an average, Kerala women produce only two babies and one expects them to be more healthy. However, available studies indicate that the proportion of low birth weight babies is on the increase [Ramankutty et al 1991a; 1991b; Premakumari 1992; Kurup 1997; Radhakrishnan 1998]. Let us review the two recent studies. The WHO has specified less than 2 kg as very low birth weight and less than 2.5 kg as low birth weight. According to Kurup's (1997) study based on two hospitals' study conducted in Thiruvananthapuram the average birth weight is on the decline. For instance, in the first hospital, the average birth weight has declined from 2.81 kg in 1987-88 to 2.65 kg in 1992-93 and in the second hospital the values are 2.85 kg and 2.73 kg respectively, during the same period. If we adopt the WHO definition, low birth weight babies respectively in one hospital during 1987-88 and 1992-93 are 22.5 and 17 [Kurup 1997]. Kurup argues for the proper nutritional care for pregnant women.

The antenatal care (ANC) visits among pregnant women before delivery are extremely high in Kerala. Unfortunately, the more the number of ANC visits, more the chances of Cesarean operation. Cesarean deliveries are extremely high. Given the excellent ANC, one would not expect the

low birth weight babies in Kerala. In a seminar at Thiruvananthapuram, a medical doctor noted that the state is fast becoming alcoholic (8.1 litres of alcohol consumption per person per year) and it may be one of the reasons for low birth weight babies. Food availability of the mother is at its minimum [Irudaya Rajan and Mishra 1997]. In 1995, among 13,420 deliveries conducted in Sree Avitam Tirunal Hospital, Thiruvananthapuram, 27 per cent of them were low birth weight babies [Radhakrishnan 1998]. More details are presented in Table 5.

One more implication of the fertility transition is to be noted in this context. The effective reproductive span (difference between the first and last child) of Kerala's women has come down from 12 years in 1970s to five years in 1990s. It indirectly indicates that Kerala's women opt to have a second child quickly and the cost of reducing birth intervals is probably more stillbirths and low birth weight babies [Mishra and Irudaya Rajan 1997].

We have questioned the SRS-IMR estimate of 14 and in our opinion, the SRS underestimates the IMR. Our estimates place the IMR for Kerala as 37. Our estimates are well supported by the available indicators of Kerala: effective reproductive span of five years, 27 per cent low birth weight babies, stillbirth rate of 10 and one-week infant mortality of 11 per thousand live births. This is the beginning of a new debate on low infant mortality and high stillbirth rate in Kerala. New innovative and inter-disciplinary research is required to unearth the reasons behind this paradox.

The Role of Public Infrastructure Investments in Regional Development

Experience of Indian States

Somik V Lall

There does not appear to be consensus on the importance of public investments as productive factors in the economic development process. In an era of increasing regional identities, there is need to understand the determinants of regional economic growth. A critical examination of the relationship between public policies and regional economic growth is provided in this paper. The main lesson that emerges from the review of regional development literature is that a single incentive or development activity cannot lead to programme or project success. The empirical analysis tests the efficacy of public infrastructure investments in the development process of 15 Indian states. The empirical analysis highlights that investments in social infrastructure have the closest linkage with economic growth across lagging, intermediate, and leading states. The empirical research suggests that the composition of public investments is important in facilitating growth, and public investment is a necessary but not sufficient condition for regional economic growth. Sensitivity towards scale and spatial issues, model specification and development of conceptual linkages should be central to future work on infrastructure productivity.

I
Background and Motivation

THE development of lagging regions is of special concern to the development community. While there is consensus on the application of standard elements of the development tool-kit towards these regions, there is less agreement on whether to undertake, and how to implement, regional planning. While approaches to regional development have changed over time [Bendavid-Val 1991], the regional planning approach emphasises strategic, geographically-focused investments in infrastructure, and the application of industrial policies to influence the location of industries and to foster the development of inter industry linkages.

The Indian government has made balanced regional development an integral part of national planning practice and objectives. Chelliah (1996) specifies that the national policy of the Indian government has been to ensure balanced development of all regions and to gradually bring down regional disparities. However, it is apparent that despite the initiatives taken under the five-year plans, inter-state disparities have increased, either due to failures of policy implementation or due to use of inappropriate approaches [Chelliah 1996]. In addition to disparities among states, there also exist intra-regional disparities within different states.

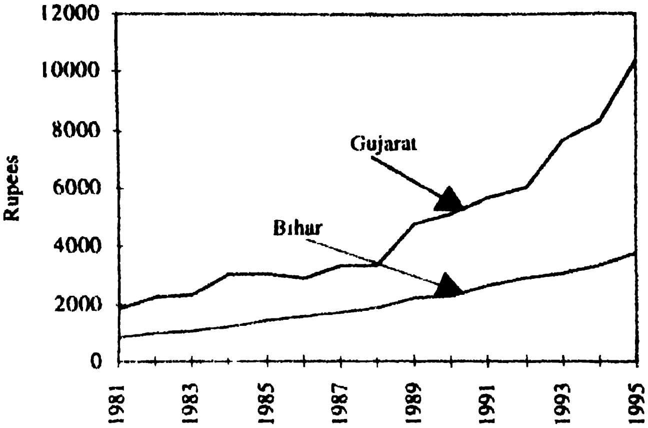
The government of India (GOI) has been using the five-year plans as a vehicle to address the concern of regional disparities in the country. One of the GOI's objectives was to improve the standards of living of the lowest 30 per cent of the population, most of them living in backward areas [Das 1993]. Instruments like the minimum needs programme have often been used to operationalise these objectives. In a recent review of planning and regional difference in India, Das (1993) indicates that the Sixth Five-Year Plan made the first explicit attempt to review the patterns of regional development in the context of policy instruments used since the early 1960s. The Planning Commission (1979) reported that decisions on resource transfers, agriculture development strategies, and industrial location policies were not always based on a systematic analysis of regional disparities and their underlying causes.

In 1983, the Indian National Committee on the Development of Backward Areas (NCDBA) reported that major federal incentives like concessional finance for industrial location have primarily benefited states that were not classified as industrially backward, and most districts receiving substantial benefits were in close proximity to relatively developed industrial centres [Lall 1983a]. In India, investment-related fiscal incentives have resulted in the location of high-dividend paying companies maintaining a zero-tax status for decades [Lall 1983b]. While the former finding can be classified as an example of policy implementation failure, the latter indicates the use of an inappropriate approach.

Poverty in India has been an intensely researched subject. While the estimation of economic inequality is a controversial issue, several studies have highlighted the inter-regional and inter-temporal variations of poverty. Das and Barua (1996) provide an interesting example of inter-regional disparities in India. They mention that Punjab has 2.5 per cent of the total national population and contributes 4 per cent-5 per cent of the aggregate net state domestic product (NSDP), while Bihar has 10 per cent of the population and contributes only 6 per cent -7 per cent of the NSDP. Figure 1[1] provides an illustration of the regional disparities between Bihar (a lagging state) and Gujarat (a leading state).

The Indian states are diverse in terms of geographic, demographic, and economic characteristics. The central and western states of Madhya Pradesh, Uttar Pradesh, Rajasthan, and Maharashtra are largest in land area, and the eastern states of Bihar and Uttar Pradesh have the largest populations. Between 1961 and 1991, five of the lagging regions remained among the poorest, and regions with above average per capita incomes remained above the average [Cashin and Sahay 1996]. Other studies highlighting regional disparities in India include Bhat et al (1995), Nair (1993), Pal (1995), Tewari (1985), Tendulkar and Jain (1995), Das (1993), and IIPO (1993). There is adequate evidence to suggest the existence of and increase in regional disparities in India. Regional output disparities among selected Indian states are displayed in Table 1. The coefficient of variation shows increasing trends in regional disparities between 1980 and 1994.

FIGURE 1: PER CAPITA STATE DOMESTIC PRODUCT (BIHAR AND GUJARAT, 1981-1995)



Source: Economic Survey of India.

Map 1 depicts inter-state variations in public infrastructure investments in the transportation and power sectors. The map suggests investment patterns do not directly translate into output differences. Map 2 depicts variations in infant mortality rates. It is visible that lagging states like Madhya Pradesh and Orissa have the highest incidence of infant mortality compared to lower incidences of infant mortality in states like Punjab, Haryana, and Maharashtra. While these maps only give a snapshot of regional variations in factors influencing long-term growth, methodologies such as GIS can be used as a visual screening device to identify potential problem areas.

The objectives of this paper are twofold. First, the relationship between public policies and regional growth is examined. This includes a discussion on the effects of infrastructure on regional development. Second, the role of public investments in the development of 15 Indian states is examined. The specific question addressed is whether the varying incidence of public infrastructure investments influenced the development patterns of lagging, intermediate and leading Indian states.

This paper is divided into four main parts. Part I provides the background and motivation for this study. Part II highlights the need to examine regions as the unit of analysis and reviews the relationship between infrastructure investments and regional growth. Part III examines the efficacy of infrastructure investments in the development of Indian states. This section presents the data, choice of methodology, model specification, and results from the empirical analysis. Part IV presents some policy implications and directions for future research.

II
Public Policies and Regional Growth

Part IIA addresses the emerging role of regional economies and emphasises the need to use regions as the unit of analysis. Part IIB examines the relationship between public expenditures in infrastructure and regional growth.

IIA: EMERGING ROLE OF REGIONAL ECONOMIES

Higgins and Savoie (1995) suggest that we are in an era of extreme fluidity and flexibility regarding the location of industry, agglomeration and deglomeration, integration and disintegration, and polarisation and 'polarisation reversal'. Region-states are gaining more importance in terms of their competitiveness in the local as well as the global economy. Ohmae (1993) indicates that region-states are the primary unit of interaction in a borderless economy and that they are shaped by the demands of the global economy, rather than political entities. He also asserts that successful multinational corporations are increasingly gaining access into markets directly through regions, rather than national capitals. Central governments have little control over consumer preferences, and workers in a region are inclined to develop loyalty to employers rather than to a central government.

There are several definitions of regions that can be used for planning and policy purposes. In addition to administratively defined regions, other definition may include rapidly growing 'urban regions', functional or economic regions, agro-ecologically defined regions, watershed management areas, and so on – where a region is considered to be an "area that shares a common problem". The empirical work in this paper uses the state as the unit of analysis primarily because it has expenditure responsibilities and taxing powers.[2]

Hansen (1990) examined the key factors involved in the remarkable economic turnaround of Mediterranean France, which had traditionally been considered to be a peripheral zone within the national economy (draws on the core-periphery relationship, where the periphery lags behind the core). Hansen looked at the role of non-economic factors that influenced the location choices of households and firms, and the role of technological innovation, service activities, and small and medium-sized enterprises (SMEs) in the regional development process. Hansen found that efficient organisation of production was strongly associated with flexibility and vertical disintegration. There are a variety of circumstances that can encourage vertical disintegration. Fragmentation may arise where there are (a) segmented labour markets (some work

tasks can be subcontracted out from firms in primary labour markets to firms in secondary labour markets); (b) uncertain or unstable markets; (c) existence of significant specialisation economies, and variation in optimal scales of output among different production stages.

The economic performance of these regions influence the economic competitiveness of nations. Richardson and Townroe (1986) motivate the discussion on economic growth and regional disparities by suggesting that regional disparities in developing countries are a consequence of economic growth. They formulate the hypothesis that if economic growth is related to the links between a particular country and the world economy, then regional economic disparities within the country are likely to be wider than that in a closed economy.

The objectives of regional development can be accomplished through a set of strategies. Some of these strategies relate to migration, rural development, and industrial development. A review of existing literature [Markusen 1994; Higgins and Savoie 1995; Richardson 1978; Richardson and Townroe 1986] shows the use of migration strategies of moving people to jobs (Thailand, Mexico, Indonesia, Korea), economic base diversification through expansion of industrial sectors (Thailand, Mexico, north-east Brazil, north-east Malaysia, Argentina), and decentralisation of economic activities (Thailand, Kenya, Argentina, Mexico). Fiscal policies have traditionally been used to stimulate the development of lagging regions. Instruments for promoting economic development in particular regions include infrastructure investments, subsidies to capital and to labour, fiscal incentives and import controls, intervention in the location of public sector employment, development of secondary cities and growth centres, and administrative decentralisation.

An important issue in the fields of regional science and development economics is whether initially lagging economies subsequently grow faster and catch up to those that had higher initial endowments. While income differentials between countries are extremely large, income differentials within regions of a given country can also be significant.

In the context of the preceding discussion, it becomes very important to understand the determinants of development of sub-national regions. In an era of regional identities, the one size fits all paradigm used by governments should gradually give way to region-specific policies that draw upon regional comparative and competitive advantages. In IIB, a discussion on the effects of infrastructure investments (a particular instrument for promoting regional development) on regional growth is provided.

IIB: INFRASTRUCTURE AND REGIONAL GROWTH

The role of infrastructure in regional economic development has often been examined since the second world war. Definitions of infrastructure vary widely from economic and social overhead capital to the general provision of public goods.[3] The concept of social infrastructure has been traditionally linked to education, health, social and recreational support and partly to environmental concerns [Haynes 1991]. This human capital perspective is augmented by a direct orientation to the welfare of human resources and its consequences, which is assumed to increase labour productivity. Economic infrastructure is also viewed as a complement to productivity. In this section, a review of the recent debate on issues surrounding economic infrastructure is provided as a link to the empirical work on Indian states.

The availability and quality of reliable economic infrastructure[4] appear to influence economic productivity and social welfare in at least two basic ways. These are:

(1) *Direct contribution to output (augmenting the productivity of private inputs)*: infrastructure as an intermediate public good takes part directly or indirectly in production processes. For ex-

ample transport and communications networks and energy can be distinguished as intermediate public goods with a direct effect on productive activities.

(2) *Enhances a region's amenities and influence location decision of private industry*: Infrastructure offers incentives to individuals and firms when they consider establishing their residence or locating a business or industry.

However, it must be noted that the relationship between infrastructure and economic growth is not monocausal. In addition to the causal link between infrastructure and regional development, there is also a feedback effect from regional development to infrastructure. Thus, in order to assess the importance of physical infrastructure in promoting growth it may be pertinent to address the productivity impact of infrastructure and the relationship between infrastructure and other factors of production especially private capital. These issues are addressed in this part of the paper.

Productivity impact of infrastructure: Several empirical studies have tested the relationship between publicly financed infrastructure and economic growth. Most empirical studies have estimated neo-classical production functions in which infrastructure investment is treated as an input to production. In the US, public infrastructure has been shown to have positive and statistically significant effects on per capita GDP at the national level [Aschaher 1989 (.39, .24); Munnell 1990 (.33); Lynde and Richmond 1993 (.20) – figures in parenthesis are elasticities]. State level studies have found elasticities lower that national level estimates [Munnell and Cook 1990 a and b (.06, .01); Holtz-Eakin and Schwartz 1995 (.03)], and metro level studies have shown that elaticities of physical infrastructure are low and insignificant in some cases [Eberts 1986 (.03); Crihfield and Panggabean 1995 (insignificant)]. In most of these studies the explanatory variables have been considered exogenous, and rates of change in per capita GDP or per capita personal income have been used as indicators of economic growth.

An interesting issue emerges from these studies is that the scale of analysis influences the size of output elasticities of infrastructure suggesting aggregation problems. The elasticities decrease progressively with reduction in geographical focus. Using state level data for the US, Munnell and Cook (1990) found the elasticity of public capital was less than half of that corresponding to the national level. A similar reduction occurred when disaggregated state and local data were used for analysis [Holtz-Eakin and Schwartz 1995; Crihfield and Panggabean 1995]. These studies conclude that, at the state and metropolitan level, even though public infrastructure is essential to economic performance, it does not have a significant impact on marginal productivity. At the metropolitan area level, Eberts (1986, 1990) estimated elasticities of output through infrastructure to be less than 10 per cent, in contrast to Aschauer's estimation of approximately 40 per cent at the national level.

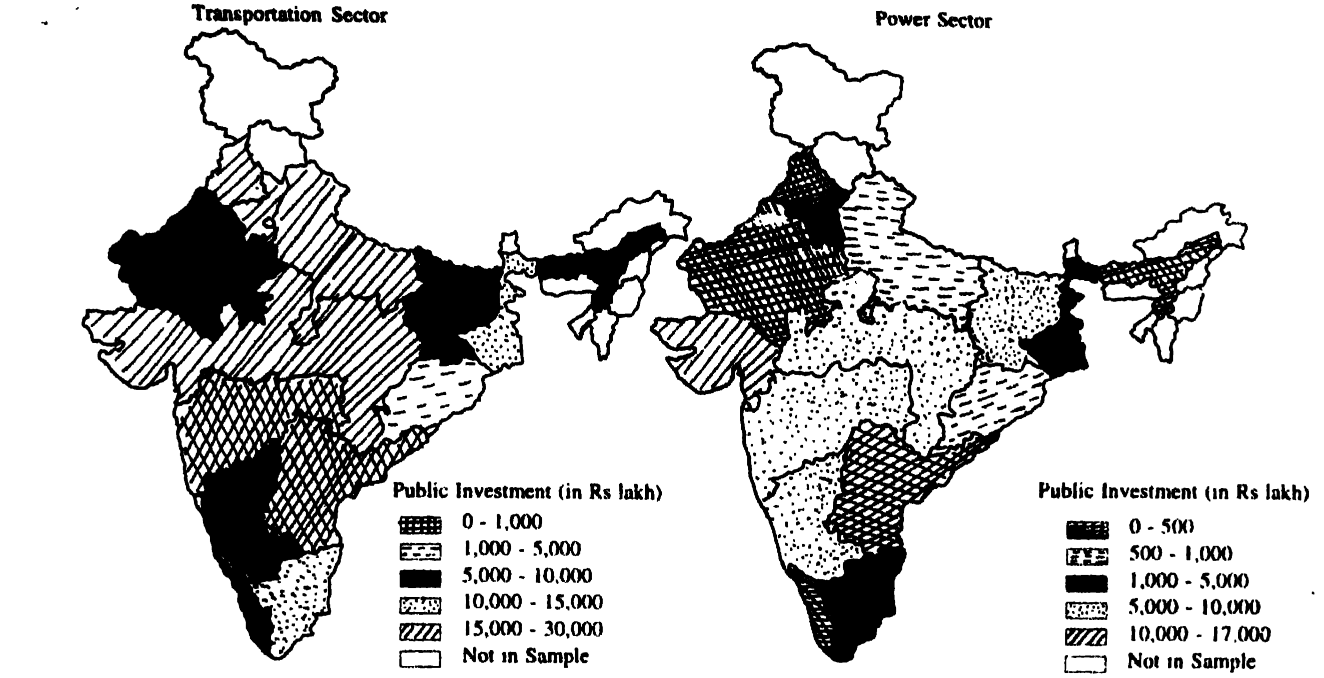
Hulten and Schwab (1993) point out that the effects of increases in public capital will be greater in the initial stages of development, when the stock of capital is relatively low, than in mature societies. This would indicate that time periods under consideration influence outcome and studies as those done by Aschauer would have differed in the initial years (say 1949-1970) and the latter years (1971-1985) of his study. Thus, the methodology used by Aschauer (1989) appears to have over-estimated the total impact of the productivity of public capital. This is consistent with Mas et al's (1995) study on Spanish regions for the period 1964-91 that concluded that while public capital stock of infrastructure significant positive effect on per capita gross value added at factor cost (estimated elasticity is 8 per cent), the elasticities derived from the same model for different sub-periods of 1964-91 revealed that the effect of infrastructures on the productivity of Spanish regions decreased over time. These findings suggest that the initial stock of infrastructure is important in determining its effects on growth. Higher initial endowments possibly translate into smaller impacts on output.

Infrastructure and private capital: There are several studies suggesting that public investment in infrastructure and private investments are complementary. These studies are based on examining the relationship between infrastructure and private capital in industrialised and developing countries.

Seitz and Licht (1992) examined the relationship between infrastructure and public capital for 11 federal states in (West) Germany for the period 1970-1988 using a trans-log cost function. Their study concluded that public capital (infrastructure) formation encourages private investment. The study also empirically demonstrated that a distinction between investment in structures versus equipment is of critical importance in the context of private capital because the effects on the former are of far greater importance than the effects on the latter.

Greene and Villanueva (1991) analysed private investment data for 23 developing countries over the period 1975-87 and showed that the ratio of public sector investment to GDP had a significant positive effect on the ratio of private sector investment to GDP. Pooled annual time-series cross-section data for nine countries – Barbados, Costa Rica, the Dominican Republic, Guatemala, Haiti, Honduras, Mexico, Panama, and Trinidad and Tobago – for the period 1971-79 show that the level of public sector investment has a positive effect on private investment [Blejer and Khan 1985]. Specifically, the study concluded that infrastructure in-

Map 1: Public Investment in Key Infrastructure Sectors 1991



Source: Reserve Bank of India; various state governments.

vestments (as proxied by the longer-term trend level of real public investment) exert a positive influence on real private investment.

One of the important aspects of infrastructure investments is that they have different short- and long-run effects. Most of the literatures on infrastructure productivity and economic analyses suggest that short term effects are in the form of increases in employment (construction) and long-term effects include both changes in employment and private output. A recent study by Shah (1992) tested these effects using a system of non-linear equations consisting of variable cost function and derived input demand equations for 26 Mexican three-digit industries (970-1986). The findings revealed that public infrastructures (electricity, communication, and transportation) have a weak complementarity with private capital only in the long run. However, labour shows complementarity with infrastructure in both short- and long-run with the degree of complementarity being higher in the short run as opposed to long run.

In addition to the complementary effects of public infrastructure investment and private capital, infrastructure influences location of private industries. Bartik (1985) suggests that road linkages emerge as an important factor influencing the location decision of the firms. Bartik (1985) used a conditional logit model estimated with Dunn and Bradstreet 1972 and 1978 data for 1607 manufacturing plants to analyse business location decisions. The results indicated that public infrastructure, e g. roads can attract new business. A 10 per cent increase in the number of miles of road increases new business location by about 4 per cent. Button. Leitham, McQuaid, and Nelson (1995) conducted a survey of new premises in the industrial/business park zoned land of Strathclyde region of Scotland for the period 1981-91, where road linkages emerged as the most highly rated factor influencing the location decision of the firms.

In addition to the complementarity between public infrastructure and private capital that enhances output and incomes in a region, it is possible that infrastructure investment may influence regional disparities by changing the competitive and comparative advantages of neighbouring states. When factors of production are mobile, public infrastructure investments in one location can draw production away from other locations. For example, infrastructure investments in region X may lead to enhanced productivity in region X, and may also have significant (positive and negative) spillovers in region Y. This could lead to a change in regional comparative advantages and may increase regional disparities. Boarnet (1997a) recently used data for California counties from 1969 through 1988, and demonstrated that such negative spillover effects are shown to exist in the case of street and highway capital. The analysis shows that changes in county output are positively associated with changes in street and highway capital within the same county, but output changes are negatively associated with changes in street and highway capital in other counties. These results suggest that *infrastructure-rich locations may*

gain output at the expense of the places from which factors of production migrated.

The review of select issues linking physical infrastructure and economic growth suggests that infrastructure investments influence regional growth. However, the effects of these investments on output, incomes, and private capital formation depend on level of development, initial endowments, and inter-jurisdictional spillovers, among other factors. It is important to be sensitive to temporal and spatial effects of these investments during policy making as well as estimating the relationship between these factors.

The following part of the paper presents results from a study of the Indian economy, and focuses on the effects of economic and social infrastructure investments on regional output in Indian states. The empirical findings from the study have been linked to some of the key ideas that emerge from the review of the literature.

III
Understanding the Role of Public Infrastructure in Regional Development: Analysis of the Indian Experience

The role of public infrastructure in regional growth was reviewed in the previous part of the paper. The results of an empirical study to test the efficacy of these investments in facilitating growth in 15 Indian states is presented in this part of the paper. The empirical work examines the role of public infrastructure investments in lagging, intermediate and leading Indian states. India appears to be a suitable laboratory for examining regional growth due to the availability of reliable data, and diversity in geographical, economic, and cultural conditions.

Part IIIA forwards the hypothesis, methodology, and description of data. Part IIIB presents results from the empirical analysis and provides some interpretations of the results.

IIIA: Hypothesis, Methodology, and Description of Data

The varying effects of infrastructure in stimulating growth in lagging, intermediate and leading Indian states are examined in this part of the paper. The hypothesis being tested is that leading, intermediate and lagging regions are structurally different, and infrastructure investments influence growth in these regions through different pathways.

Sources of Data: Data for the empirical studies were obtained from the National Institute of Public Finance and Policy, Society for Development Studies, Reserve Bank of India Bulletins and the National Census. The highway network figures were obtained from the ministry of surface transport, government of India. Data sources for gross energy generation are *Public Electricity Supply All-India Statistics* (various issues), Department of Power, ministry of energy; and Kendriya Vidyut Pradhikaran, Gram Vidyutikaran Nideshalaya CEA, New Delhi. Data sources for public investment figures include annual budgets of the state governments and the Reserve Bank of India. Data for the number of hospital beds are reported in *Health Information in India* (various issues), Directorate of Health Services. Other data sources include the Economic Survey of India, and the Annual Survey of Industries.

The collection and assimilation of data sets is one of the most challenging features of conducting empirical research in developing countries. This has been the case for the study of the Indian economy where assimilating data from various sources was a cost and time intensive exercise.

Methodology: A common econometric approach is to estimate a modified Cobb-Douglas production function in which infrastructure investment is treated as an input to production. Earlier econometric studies on the relationship between productivity and infrastructure investment carried out by Aschauer (1989), Munnell (1990), and Holtz-Eakin (1992), as described before, included the stock of public capital in an aggregate production function. The production function without public capital is written as:

$$Q_{it} = \beta_0 L_{it}^{\beta_1} K_{it}^{\beta_2} e^{\varepsilon_{it}} \qquad \ldots(1)$$

Q_{it} = output in region (i) in time (t), L_{it} = employment in the private sector in region i, time t; K_{it} = private capital investment in region i, time t The government capital stock (G) is included in the relationship by modifying (1).

$$Q_{it} = \beta_0 L_{it}^{\beta_1} K_{it}^{\beta_2} G_{it}^{\beta_3} e^{\varepsilon_{it}} \qquad \ldots(2)$$

Taking logs of both sides of the Cobb-Douglas functional form, and denoting the operational variables for private capital investments (K), private employment (L), and public infrastructure investments, we get:

$$\ln Q_{it} = \beta_0 + \beta_1 \ln PEM_{it} + \beta_2 \ln PVK_{it} + \beta_3 \ln PHY_{it} + \beta_4 \ln SOC_{it} + \varepsilon_{it} \qquad \ldots(3)$$

where PEM represents private employment, PVK represents private investment, PHY stands for public investments in economic (physical) infrastructure and SOC represents public investment in social infrastructure.

In this paper, public expenditure in economic and social infrastructure, private investment, and private employment have been used as explanatory variables for per capita state domestic product (SDP). Data for public expenditures were obtained from the state budgets. Public economic infrastructure expenditures were calculated by summing annual state expenditures on transportation, power, telecommunication and irrigation. Public social infrastructure expenditures were calculated by following the same procedure for education, water supply and sanitation, and medical and public health. Private investment was measured by the annual loans disbursed by All India Financial Institutions (AIFI) to the private sector. These data were available at the state level. Private employment is measured by the end of year employment in the private sector. Output elasticities of these variables are taken to examine the contribution of each factor in explaining state level economic growth.

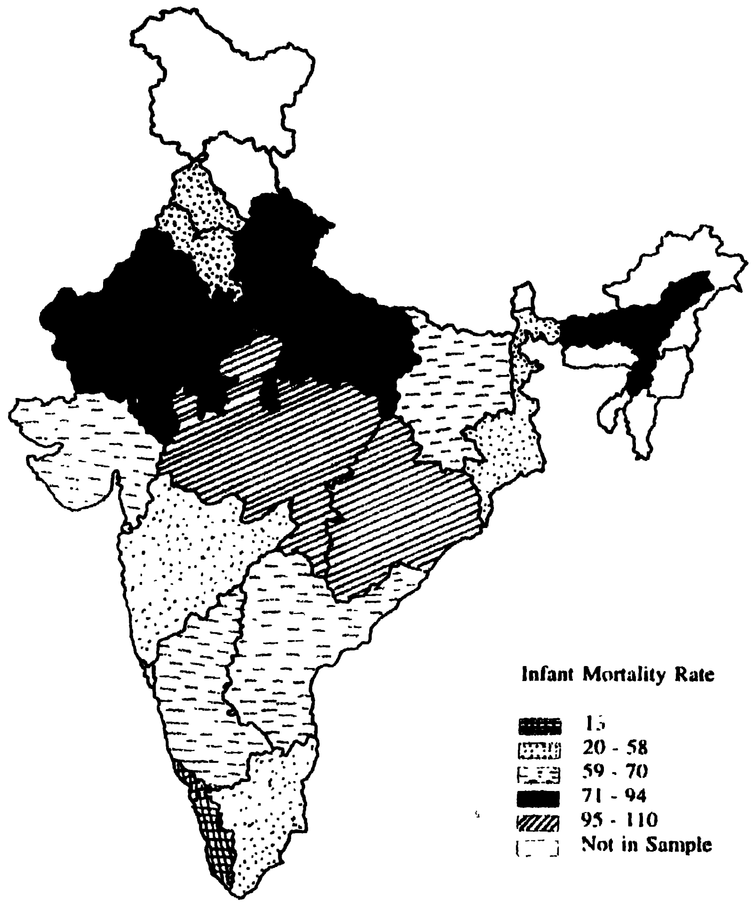
IIIB: Results from Empirical Analysis and Linkages with Policy

The Cobb-Douglas framework used in the empirical analysis computes the output elasticities of private employment, private investment, public expenditures in

social (water supply and sanitation, education, medical and public health) and economic (transportation, power, irrigation) infrastructure. The elasticity estimates the per cent change in output (per capita GDP) with a 1 per cent change in the explanatory variable (capital and labour).

The states were classified as lagging, intermediate, and leading based on per capita state domestic product. The classification of lagging states is consistent with the Planning Commission's definition of backward states. The lagging states in the study are Bihar, Madhya Pradesh, Orissa, Rajasthan, and Uttar Pradesh; intermediate states are Assam, Karnataka, Andhra Pradesh, Kerala, Tamil Nadu, and West Bengal; and the leading states are Punjab, Haryana, Maharashtra, and Gujarat. The results from the empirical study are presented in Tables 2, 3, and 4. The rationale for using separate regional panels and not including all states together is that these states have different levels of development and the infrastructure productivity literature (see review in Section II) suggests that the effect of infrastructure investments are sensitive to level of development and initial endowments. This supports the hypothesis that leading, intermediate and lagging regions are not homogeneous but are structurally different and need to be examined separately.

MAP 2: INFANT MORTALITY RATES ACROSS INDIAN STATES 1993



Source. Sample Registrar System, Registrar General of India, Ministry of Home Affairs, New Delh

The model was estimated using a Cobb-Douglas specification. The production function was estimated using several estimation procedures. These include the Ordinary Least Squares (OLS) model, Fixed Effects (FE) model, Seemingly Unrelated Regression (SUR) model, and the Two Stage Least Squares (TSLS) model. Various estimation methods were used to examine the sensitivity of the estimates to model specification. For the three panels examined in the study, the OLS method does not appear to account for inter-state differences through the common constant term. The FE model is a better specification to account for differences across states in the regional panels. Some interpretations of the results for the lagging, intermediate and leading states are presented below.

For the lagging states in the study, results from the FE model indicate that public investments in economic infrastructure display negative output elasticity. This implies that at the margin, an increase in economic infrastructure investment has negative effect on regional output. Similar negative elasticities are observed using the SUR and the TSLS estimation methods. Private capital investments do not display significant output elasticities. Public investments in social infrastructure and private employment consistently show positive output elasticities across the three estimation procedures (FE, SUR, TSLS).

These results indicate that social infrastructure has a positive effect on growth in lagging Indian states. Improvements in health care and education facilities contribute to the formation of better qualified and healthier labour force directly translating to higher productivity. State government policies in lagging states may be best suited towards investing in social infrastructure as well as developing a pro-business environment. Private employment, also a significant determinant of growth in lagging states, is strongly influenced by availability of trained and well qualified force. The lack of adequate human capital may be an important reason for the low levels of regional output as well as sub-optimal utilisation of private capital.

In the case of intermediate states, public expenditure on social infrastructure appears to have strong positive (statistically significant) output elasticities. The results from the various estimation methods (FE SUR, TSLS) suggest that the output elasticity of social infrastructure investment range from 0.30 to 0.34. The estimate for private investment, public economi infrastructure investments, and privat employment are either negative or insignificant.

The leading states in the study show results similar to those obtained for intermediate states. Private investment, publi economic infrastructure investment, an private employment have either a negativ or insignificant effect on regional output On the other hand, social infrastructure investments have positive and significan effects on regional growth with elasticitie ranging from 0.31 to 0.34.

A common theme then emerges across all states is that investments in socia infrastructure have positive effects or regional growth. Investments in education, public health, and water supply and sanitation have externalities and clea public good elements. This theme is consistent with the works of Niles Hanser (1972) and other prominent scholars in the fields of regional science and economi

development who suggest that the quality of human capital ranks very high in the development of lagging areas. These results are transferable to the leading states as there exist significant intra-state disparities in the leading states with polarised growth occurring around major urban centres. For example, in 1993 the per capita output for Mumbai was estimated at Rs 8,633 [Society for Development Studies 1995] compared to Rs 3,696 for the state of Maharashtra. The large population base in Mumbai coupled with high output would tend to skew the state level per capita output data, and not take intra-state variations into account. State level analyses do not highlight intra-state disparities, and the output effects of social infrastructure may be more visible in the lagging areas of the leading states, rather than the state as a whole. More disaggregated studies at the district level would be necessary to examine this hypothesis.

We are familiar with the disadvantages lagging areas face due to deficiencies in health, education, and labour force training. However, in addition to the clear linkages with economic productivity, lack of investment in human resources also has adverse effects on the political and business leadership of these areas. It is quite likely that lack of alternative opportunities coupled with selective out-migration have removed dedicated, well-educated, and motivated men and women whose views extend beyond limited local horizons. In an era of change and liberalisation, investment in human resources will be critical for developing the comparative advantage of less developed areas.

IV
Policy Implications and Direction for Future Research

Regional development instruments used across the world have been varied and their impact has not necessarily been uniform. In most cases, it has been difficult to isolate the efficacy and impact of individual instruments, as regional development is a function of many activities.

In most cases, 'sustainable' regional development is not likely to take place if the regional employment base is not developed. Fiscal policy, monetary policy, and public expenditures have been the normal routes to attain balanced regional development. The evidence on the effectiveness of these routes to regional development is not adequate to have confidence in their appropriateness as growth instruments, especially in developing countries where regional poverty is of primary concern.

In addition to provision of infrastructure and diversification of the regional economic base, income and employment generation activities have been important regional development objectives. However, fiscal policies have traditionally focused on attracting investments by providing tax incentives through a combination of depreciation allowances, investment allowances, and export promotion discounts, among others. Fiscal measures like commodity taxation, including sales tax which are found to be shifted forward, and VAT that reduces double taxation of goods in the production cycle, also seek to reduce operational costs of industries and contribute to higher rates of return. None of these fiscal instruments seek to directly influence the employment generation process. Public expenditures may be a more effective strategy than investment stimulating fiscal breaks for stimulating regional growth, provided that the activities are properly assessed and are not provided across the board (targeted), as is often the case in public expenditure programmes.

The direct impact of fiscal policies on regional development, especially in low-income situations has not been noticeable. A major limitation in most studies evaluating the efficacy of fiscal policies has been the inability to simulate the counterfactual. To quote Lent (1967), "It is impossible to determine conclusively the 'success' or 'failure' of any country's investment-incentive programme because we do not know what the record would have been in its absence". In this regard, development of methodologies to specify the counterfactual and collection of reliable data should be very high on the research agenda of studies mapping the relationship between fiscal policies and regional growth.

In early stages of development, investments in network infrastructure may be the most important contributor to regional economic growth. However in the long run – in intermediate and latter stages of development investments in soft infrastructure like human capital formation, institutional co-ordination, infrastructure to reduce transaction costs and improve entrepreneurial capabilities in a region are likely to emerge as important factors in stimulating regional growth. Other factors like fiscal breaks, subsidised credit, infrastructure development through public expenditures, liberal planning norms, and streamlining of administrative procedures and regulatory mechanisms can at best, be supportive elements in the development of lagging regions.

Direction for future research: In most developing countries, the absence of reliable databases at the regional level reduces the scope of empirical testing. Data collection and dissemination at the regional level needs to be high on the research agenda in developing countries. In India, the availability of public investment and private investment data at the district level would be useful for examining intra-state as well as inter-state growth effects. Another important contribution that could be made to the existing body of knowledge would be the inclusion of concepts of theoretical spatial economics and spatial econometrics in empirical studies. Identifying the spillover effects (both positive and negative) of network infrastructure is very important for policy decisions regarding potential regional competition and co-operation for infrastructure investments.

While this study has not shown positive linkages between economic infrastructure investments and regional economic growth, it would be naive to say that the stock of infrastructure does not influence economic performance at some level. The simple uni-directional causal model does not appear to capture the multiple impact path-potentials between infrastructure and growth. Further, there appears to be issue of appropriate aggregation levels. In addition to being sensitive towards scale and spatial issues, model specification and development of conceptual linkages are central to work on infrastructure productivity. The explanatory variables in most empirical studies (including this study) are considered to be exogenous to the model. However, it has not been determined whether the neo-classical production function approach used in most models is an appropriate functional form to specify the relationship between infrastructure investments and economic growth. Hence, the statistical results may partially be a product of model mis-specification. The use of better econometric specifications (includes endogenous models, accounting for spatial spillover effects) significantly reduces the elasticity of public infrastructure as a component of economic growth [Gramlich 1994; Boarnet 1997a, 1997b; Kelejian and Robinson 1997]. The cost and time involved in developing these models at the regional level in a developing country like India has limited the scope of such empirical testing at the present time. However, such extensions need to be part of the future research agenda.

Notes

[I would like to thank, without implicating Kingsley Haynes, Roger Stough, Vinay Lall, Sanjoy Chakravorty, George Pomeroy, Peter Arena, and Sanjay Marwah for helpful comments and advice.]

1 State Domestic Product reported in current prices.
2 It must be noted that there are drawbacks to this approach. If regions are confined to administrative boundaries (i e, states), then it is possible that the average income in the state does not correctly reflect internal disparities. There may be poverty issues that need to be examined by defining regions across states or sub-regions within a state.
3 National and regional development strategies have often been related to patterns of infrastructure investment [Rosenstein-Rodan 1943; Nurske 1953; Hirschman 1958; Nadiri 1970].
4 Economic infrastructure includes roads, streets, bridges, telecommunications, power, water treatment and distribution systems, irrigation, waterways, airports and mass transit.

Education Guarantee Scheme

What Does It Claim?

R Gopalakrishnan
Amita Sharma

RAHUL (*EPW*, January 9, 1999) challenges what he terms "tall claims" made by us in our discussion of the Education Guarantee Scheme of Madhya Pradesh (*EPW*, September 6, 1998). It would have contributed to a more pointed discussion if he had raised facts to counter the so-called 'claims' by sharing his experiences of how the EGS is shaping on the ground rather than tilt at hypotheses. He has also chosen to ignore the conceptual analysis in our paper which explained the rationale, and the context which led to the EGS. His observations nevertheless merit discussion because they relate in general to the concern for quality education and because they provide an opportunity to elaborate on some of the issues raised in our paper.

First, let us take the claims. EGS did make the claim that simple solutions engineered through community participation supported by local governments like panchayats and the state government can quickly close the gaps in access to schooling facility. In our opinion this had to precede any other issue and the elite of this country ought not to have even a right to discuss primary education unless it has ensured this as a basic right. Recently Amartya Sen while releasing the PROBE report (Public Report on Basic Education) in Delhi on January 2 drew attention to the 'curriculum debates' that occupy our attention even when basic schooling facilities are denied to millions of our children. The "tall claim" made in our paper has really been the ability to universalise access in a time-bound manner through EGS. We quote, "The EGS was in short an effort of the state government to universalise access to schooling facility focusing on the hitherto unreached sections in the quickest possible time".

That access is a problem and a major impediment to steady participation of children in schools needs to be understood clearly both in terms of the *scale* of the problem and its *complexity*. The PROBE report exposes the myth that schools are available while the latest annual report (1997-98) of the department of education, government of India, claims that "accessibility of schooling facilities is no longer a problem". PROBE notes that "not just physical distance but also social distance creates barriers to schooling since villages are divided into separate hamlets and children may be unwilling to go from one hamlet to another". Well, we in Madhya Pradesh had already acknowledged this as early as 1996 when our house to house survey through the Lok Sampark Abhiyan which was a detailed mapping of gaps in access to schooling facilities revealed the gap and, as we wrote, "the EGS was created in response to this need". There were several areas that remained unserved by the schooling system. In addition as our paper pointed out, the problem of access was complicated by the distinct "habitation pattern of tribal areas where people live in dispersed habitations called majra, tola, phalia" which "meant that even if a school came up in one hamlet of the village, several hamlets of the same village could not access it because they were often as much as 5 km away from the main village".

The problem of geographical access is linked with social factors and most often the hamlets on the periphery of the main village tended to be those inhabited by the scheduled caste or scheduled tribe groups. How this fundamental difference made by the EGS in providing first-time access, after 50 years of political democracy, to these deprived children has been overlooked by Rahul beats our understanding. In the 19,860 hamlets where schools have now opened, there was simply no pre-existing facility.

Now let us take the issue of quality. Before even we begin discussing this issue we would like to state a very amusing experience. Our experience has been that ever since the EGS started as an alternative community-centred model, some of the most ardent critics of this have been from the NGO sector who never tired of telling governments on the need to move to community-centred alternatives. Suddenly they see a role abnegation by the state and our simple question is why was the non-provision of schooling facility in the 19,000 villages not seen as role abnegation? When the PROBE report says that 50 per cent of government primary schools do not transact effective education, do we want more of the same or change the methodology to bring in community and panchayat control? Let these issues pass for the present. Let us take up Rahul on the feasibility of EGS to provide quality education because it provides us an opportunity to discuss a very vital concern.

Rahul complains that "they have not bothered to define exactly what they mean by quality education". Our paper succinctly states "quality parameters like training (on par with the formal schools), cluster level academic support and supervision and supply of inputs like free teaching-learning material and midday meals" as essential inputs in EGS schools. The paper also acknowledges that an important quality "attribute which may be seen to disadvantage the EGS school today is that it functions out of a space provided by the community to conduct teaching-learning. Conceding that the nature of space also, along with several other attributes, has a role in ensuring quality the EGS schools may need to be enabled to improve the learning spaces." The paper further anticipates the need for "meeting the demand for more teachers and ensuring training, specially multigrade training". Teacher training is not just inductional but recurring annually for an average of 12-15 days. EGS also recognises that quality schooling is facilitated by involving the local community. Therefore our paper argues that desirable attributes of a formal primary school should be acquired by EGS "in a way that does not negate its community-centredness".

Summarised, the paper's discussion on quality identifies quality inputs in a holistic manner because the school is an integrated functioning of many factors and the EGS seeks to build quality on all these parameters: academic and managerial. The tragedy about quality debates has been that these have so far largely been confined to debates on scholastic issues. *We see quality on two specific prongs: academic and managerial*. If management issues are not addressed quality of education will not improve. As the paper points out "most evaluations of the primary education have shown that it is a lack of accountability of the teacher to the local community that has been the major cause of poor performance and so the EGS may result in strengthening the primary education sector as a whole by bringing in

greater community control". EGS aimed at a paradigm shift from the primary school as a local appendage of the large bureaucratic system to community managed schools by "forging a partnership between state government, panchayats and communities".

To reiterate, we need a more comprehensive view of quality than those Rahul identifies. Rahul's understanding of quality is gleaned from phrases like "expertise to compete and get into elite professions...at the end of schooling", that teachers need to be "competent" and "committed", "trained in new methods of teaching", etc, all of which account only for scholastic inputs. He seems to have completely missed the fact that academic transactions are not in isolation of a whole system ranging from simple basics of books in hand to the complex relationship between motivation and accountability. The EGS seeks to address this complexity. Complex problems however do not need to have complex and 'vexatious' solutions and the simplicity of strategies does not necessarily reflect a simplistic analysis of complex problems.

EGS's comprehensive quality parameters indicate to anyone familiar with government schooling systems that the main emphasis is to integrate critical factors that affect quality. Part of the complexity of the quality issue is that often only scholastic issues are laboured with no attention to the other factors mostly relating to management that affect quality. Recent writings on school quality fortunately have started to look at a larger range of factors as affecting school effectiveness.

Since EGS provides a teacher to a group of 40 children (25 in tribal areas), its teacher-pupil ratio works out to an average of 1.30 for tribal and non-tribal areas. The teacher-pupil ratio (TPR) in EGS is always at manageable level as against the present 1:50 TPR for formal schools, "hopelessly outnumbered by students" as Rahul bemoans. In fact by its very design the EGS maintains this low TPR as stipulated by the Yashpal Committee set up by the government of India to recommend on educational reforms. Academically, EGS builds on the insights that have developed over the past few years both by adopting what is emerging as potentially viable and modifying what seems necessary. Therefore, it uses the curriculum and the new teaching-learning materials of the formal schools which in MP have been recently revised and made competency-based on a field trial basis with the collaboration of NGOs. Therefore there has been no compromise on the content of teaching.

Let us examine the process. One, EGS is not a condensed course seeking to crash a full five-year curriculum into part-time education as NFE does or even as TLC seeking to impart education equivalent to the third standard of primary schools in six months' time. Rahul has summarily clubbed these three programmes together which appears to have been the result of his confusion regarding their academic structures. The EGS is not a campaign like TLC nor part-time like NFE. A major weakness of NFE was its unrealistic effort to impart a full-scale formal curriculum through condensed course duration of two-three years using the same uncondensed materials. The paper makes very clear that the EGS could grow into a school that offers education up to class 5 of the formal school by incremental addition each year. Two, teacher training is on par with the formal system. Each year the guruji undergoes a 12-15 days training course.

The EGS has been captured in the academic school support and supervision system created through the cluster resource centres which are academic resource support centres for a group of 8-10 schools. The important point to note here is that EGS has been involved with this quality reform process which equips EGS not just for delivering only functional literacy but the entire range of competencies identified for the formal stage. The paper claims that in EGS the effort is to identify and assimilate qualitatively desirable attributes of a good school and not that EGS is an instant delivery of quality.

Quality outcomes are not overnight miracles, not even for well-endowed private schools. The EGS is two years and 22 days old as of January 22, 1999. To assess its academic quality presently would be pertinent and desirable, but to make categorical and conclusive judgments right now would be premature and rash even in the opinion of the most fanatic enthusiast for quality education.

Rahul is sceptical of whether all these qualitative initiatives can be delivered through the guruji. He presumes that these local resident gurujis of the EGS schools have inferior qualifications. This is contrary to facts. The educational eligibility of the guruji of the EGS school, the shiksha karmi and the assistant teacher is higher secondary and so there is no lowering of educational qualifications for the EGS guruji. On the contrary, the data show that 88 per cent gurujis are higher secondary, 9 per cent are graduates and 3 per cent post-graduates. There are no gurujis below higher secondary, whereas there are 24 per cent assistant teachers of the formal government system who are below higher secondary and 31 per cent who are higher secondary, i e, 55 per cent of the highest paid primary school teachers are not more qualified than the gurujis. The second worry is that they are being underpaid. Here, Rahul's own statements contradict his suspicion that performance levels and payment levels have a simple equivalence. He is at pains to point out that "good teaching is a painstaking work and the average teacher is a government servant who does not like to take pains". He also finds that despite "an increase in the salary as an incentive" the "level of absenteeism among teachers is horrifying". So what is the inference? Surely, you want a change. Try local accountability is what we say. Obviously, automatically increasing salaries have not meant an automatic increase in the performance quality of teachers and have only rendered them into 'government servants' and less as teachers. Herein is a complex issue of what makes the teacher perform and Rahul has really simplified this complex issue into one of higher salaries, even against his own observations on what is happening in the primary schools. Incidentally, it would be revealing to Rahul that the costly private schools whose quality he has faith in pay their teachers much less than the government schools, ranging from an average amount of Rs 400 to 4,000 pm in Bhopal (in a range equal to a guruji and much less than the assistant teacher).

Besides minimum educational qualifications (in this case on par with other teachers) and academic preparation of the teacher, an important factor relates to how does the teacher regard himself and (this follows from the first question) to whom does he think he is accountable. The traditional teacher considers himself a government servant, a point that Rahul laments as detrimental to quality and accountable to no one because there is no system which links his performance with his service benefits. The EGS was an effort to make the teacher accountable to the community which is why the community chooses the teacher so that he does not regard himself as a government servant. It was also an attempt to initiate a system of gradually linking performance with remunerations, by starting the teacher on an honorarium which can be slowly built up as teacher and school performance strengthen. Our paper indicates that the "scheme also plans to provide for the panchayats' to add on to the salary of the guruji from the panchayats' own resources". In the face of the vast non-performance of the system managed by highly paid teachers enjoying

complete security and not accountable for what they teach, the EGS argues in favour of teachers on contract, from the local community and accountable to it. The argument is in favour of the community of learners because it sees the teacher as subordinate to community interests and does not place paramount value on teacher salaries seen in isolation from the interest of the community whose education is their responsibility.

The issue of local accountability is critical. The EGS stems from the belief that community involvement in school management and the sense of local ownership of the school by the community is what will make the difference, academic inputs and a teacher with basic educational qualifications being available. Is it not obvious that a scheduled caste guruji teaching his scheduled caste brethren will have the empathy to transact a liberative pedagogy irrespective of whether it is imparted in training? The word community has become a buzzword and so suspect and so perhaps Rahul has chosen to ignore it completely. But in fact the EGS seeks to work on a conscious strategy of de-bureaucratising educational management by giving specific powers to the local people to demand a school and choose their teacher as well as by decentralising powers to the panchayats.

In our country some sections of society that seem very suspicious of panchayati raj seem to be those very sections who had until now argued for de-governmentalisation and community action. Legitimate political structures like panchayats seem to be anathema to some of them, and pardon our saying so, some of these come through in Rahul's diatribe. He writes that the "sarpanches were told to get going and find suitable boys or girls to...provide education in deprived areas". Panchayats can become effective and key agents for bridging community and schools – a role they can come up to only by getting a chance to do it. This is certainly a more viable alternative than continuing to perpetuate a centralised and bureaucratic system that so far has only alienated the school from the community. Another instance of baseless statements is "the EGS has begun to falter after the initial stages". Says who? While EGS has constantly sought independent evaluations even in its short history of two years by professionals because it looks upon such feedback as an opportunity for improvement, it would be quite helpless to act on such baseless generalisations.

On the question of costs. Costs need to be viewed in a context of resources that can be made available in a sustainable way, and against a measurement of desired attributes. Desired attributes themselves will range from the base where one begins, which will define the basic – which will be a varying factor, because of initial basic inequalities – to what can be increasingly added on. The EGS emerged in a context of financial constraints and large-scale needs, particularly in backward areas. This was a scenario where the large scale of problems and the limited scale of resources presented two options to the government: defer/stagger action for education, even for providing basic facilities which would have meant another 12-15 years of persistent neglect of the already very deprived areas or to seek innovative and cost-effective options. The government of Madhya Pradesh went in for the latter. The EGS is cost-effective and does not compromise on quality inputs even on a reduced budget by focusing on critical inputs, working through decentralisation, cutting out administrative overheads, and transferring the resources to the children and the school rather than to multiplying an inspectorate bureaucracy and by consciously eliciting a public-private partnership to stimulate local stakes in the school. The issue here is not just how much but on what. The great advantage of EGS is that it integrates costs of different critical inputs into a 'school cost' which reflects its perception of quality as an integrated approach. It does not split up the school into an artificial and undesirable division of teacher salary as school cost and quality costs as add on. In percentage terms, 82 per cent of the more expensive formal school goes into teacher salary, 1 per cent into training and 16 per cent on furniture and equipment and none to the children, whereas in EGS it is 71 per cent on salary, 10 per cent on equipment, 7 per cent on training and 12 per cent on learning materials for children. So the EGS does cost less but improves upon what the present system offers to the child. This is certainly not a claim to the most advantaged conditions of schooling (critical basic inputs have been claimed). It is dependent on a public finance context and needs to be continuously improved through local partnership because that is seen as critical to school effectiveness, a point that our paper had made when we wrote about "gaining desirable attributes of a school in a manner that does not negate its spirit of community centredness". The question is whether it would be better to go on spending on salaries of educational bureaucracy and teachers or to review this and evolve alternatives that orient resources towards inputs and processes that might help create a locally accountable school.

The end, the social sector in our country seems to be for cursing. Everyone is happy bemoaning everything. Well, some of these problems have solutions. If India has to have mass education, we Indians have to devise ways. Social activists are respected by all of us because they have dust on their footwear. However, that is strangely enough converting into an intellectual privilege for shoddy analysis and sweeping generalisations.

FIRST BIENNIAL CONFERENCE OF

THE INDIAN SOCIETY FOR ECOLOGICAL ECONOMICS

(Indian Chapter of International Society for Ecological Economics)
on "Ecological Economics for Sustainable Development"
December 1999

The first biennial conference of the Indian Society for Ecological Economics will be held in December 1999 The conference theme is, "Ecological Economics for Sustainable Development" It is planned as a two and a half day event with plenary sessions, concurrent sessions and panel discussions on selected topics

Papers are invited on the following sub-themes

- Accounting for sustainability concepts and experiences
- Strategy for green growth in developing economics
- Water resources, technology and sustainable development
- Economic recycling and waste management ecological and economic implication for the sustainable use
- Infrastructure and Energy
- Bio-diversity, Water and Air
- Institutions and environmental governance
- Resource Valuation, Management and Policy
- Methodology as central in problems of the environment costbenefit multi-criteria, other paradigms
- Inter species study for human development legal aspects, ethics and equality
- Trade and environment

Papers focusing on inter-disciplinary aspects and highlighting the inter-linkages between economic and ecological/environmental dimensions of the sub-themes shall be given preference They may deal with theoretical aspects and/or present results of case studies using statistical or scientific tools of analysis Papers highlighting developing country problems shall be given preference

Abstracts of papers of about 500-800 words may be sent so as to reach the following latest by April 30, 1999

Ms Preeti Sethi
Indian Society for Ecological Economics
R No 206, Institute of Economic Growth,
University Enclave, Delhi-110007

Authors of papers selected by the Programmes Committee for presentation shall be informed by July 15, 1999 and full papers are to be submitted by September 30, 1999 Venue of the conference shall be announced at a later date Limited support for travel shall be available

My strength

LIC's
Group Superannuation and Group Gratuity Schemes
- The driving force

Group Superannuation Scheme

- Contributions (inclusive of PF), are tax deductible up to 27% of salary.
- If implemented retrospectively, up to 80% of contributions (with respect to past service), are allowed for tax deduction spread over 5 years.
- Interest accrued at the rate of 11.75% to 12.8% p.a. (during the financial year 1998-99), depending on the size of the fund
- The Superannuation Scheme can also be linked to life insurance cover.
- On retirement, a choice of pension payment plans is available.

Group Gratuity Scheme

- Simple administration, no more worries of planning for gratuity payments.
- Attractive returns and tax benefits.
- Scientific funding of gratuity liability based on actuarial valuation
- Instalment funding for past liability, eligible for 100% income tax deduction in the year of payment.
- Employees insured for death benefit based on full anticipated service.
- Dual benefit of liquidity with high yield.
- Interest accrued at the rate of 11.75% to 12.8% p.a. (during the financial year 1998-99), depending on the size of the fund

For details, mail us this coupon or contact us at the nearest LIC Divisional Office / Zonal Office.

I would like to know more about the LIC Group Superannuation and / or Group Gratuity Scheme

Transition Themes

Agricultural diversification is being suggested as a possible strategy for addressing the current crisis in the sector in Punjab. Analysis of state-level secondary data and the results of a field survey in Ludhiana district provide some inputs on the potential for agricultural diversification. **A-2** An in-depth resurvey in two villages of eastern UP records the economic and institutional changes occurring in rice production and inquires whether the semi-feudal agrarian relations in the region have permitted expansion of production through new institutions. **A-11** A rapid assessment of water users' co-operatives in Maharashtra – intended to facilitate farmer participation in irrigation – shows that in an expanding area irrigation management has already been transferred to farmers. **A-17**

Expanding Horizons

The commercialisation of transgenic technology in India may well come up against the barrier of market demand incoherence, which will thus offer protection to plant varieties. **A-34** There is a need to rethink agricultural trade policy if India is to augment its agricultural exports in the current context of international trade in agricultural products. **A-27** What role does rural infrastructural development play in agricultural growth? Evolving a composite index of rural infrastructure statewise facilitates analysis of overall development. **A-43**

Fusion of Opposite Tendencies

Among the oppressed an appeal to caste for political mobilisation is occurring in an effort to subvert the very relations of the varna order; among the established middle classes is occurring a decomposition of consciousness into articulated caste interests of the upper castes; and among Muslim communities there is emerging a split between the masses and the gentry which is realigning interests. This fusion of opposite tendencies makes the process of democratisation complicated. **757**

Populist Pressures

Instead of showing the way towards reforming the financial system to confront the current crisis in the state's finances, Maharashtra's finance minister, in an effort to gain popular support, has taken several steps backwards in his 1999-2000 budget. **738**

Uneven Development

An examination of the sharpening divergence of income levels across states reveals that the divergence in growth rates can be largely explained by the skewed distribution of public expenditure and infrastructure growth. **769**

Trading Made Easy

The India-Sri Lanka free trade accord will have far-reaching implications for both countries and needs to be implemented ensuring minimum adjustment cost all round. **750**

Science and Postmodernism

To club fascism with postmodernism and then use this as an excuse to prioritise scientific epistemology does no justice to either science or postmodernism. **779**

Building Peace

An alternative peace-building approach to the Kashmir problem inspired by efforts to establish peace in northern Ireland that takes into account the complex intersection of 'domestic' and international factors. **762**

Writing New Texts

The task before the Congress leadership is to hasten the disintegration of the mythical maratha vote and build new alliances with poorer sections including marathas and dalits. **743**

Syncretism at Stake

Events at the Baba Budangiri shrine in Karnataka throw light on how class factors are intersecting hindutva forces to produce perhaps a lull in the latter's activities. **746**

Prejudiced Forums

The recent killing of a Black student in Britain and the report of the enquiry into it expose racist tendencies in the country's law enforcement bodies. **748**

Misinterpreting Muzaffar Ahmed

ADITYA NIGAM's 'Marxism and the Post-colonial World' (January 2-8/9-15, 1999) contains certain misreadings of Muzaffar Ahmed, Peasants and Workers Party (PWP) which was later renamed Workers and Peasant Party (WPP) was the open organisation of the CPI then forced to work secretly. Nigam, it seems, has missed this simple fact though it is explicitly stated in Muzaffar's memoirs. It is obvious that Muzaffar and his comrades were seeking an alliance of workers and peasants. Forming a party based on a single class, as Nigam believes (pp 41-42), was never the aim of the communists in India or for that matter anywhere else in the world. The declared aim was to form a party multiclass in composition but led by the working-class. It was this conceptual understanding which prompted Muzaffar Ahmed and other communists to press for a change of name at the PWP conferences, first in 1926 and then successfully in 1928. The protracted process reveals the attempt to establish working class hegemony over the democratic block along lines advocated by Marx himself. Nigam's contention that 'fear' of 'expulsion' and 'ridicule' by the Comintern made Muzaffar press for a change of name is laughable. The spectre of Comintern's omnipotent control did not extend as far as the CPI. In fact, in the 1920s, Muzaffar was the Comintern's only conduit in this part of India and there was no one here to expel him. The absence of Comintern's adequate communication is humourously recounted in Muzaffar's memoirs. A self-critical humour is also evident in the lines recounting PWP conferences which Nigam may have missed. Muzaffar's reticent humour is more apparent in the Bengali original than the English translation. It was his reading of Marxism-Leninism rather than Comintern's ideological and possibly punitive measures which made Muzaffar act the way he did. The same ideological understanding prevented him from drawing the conclusion Nigam would have liked him to draw in the matter of M N Roy's expulsion. The debate with M N Roy was, once again, not about class composition of the Communist Party but which class would lead it.

For men like Muzaffar 'epistemological leap' from religio-nationalist identity to communist identity was mediated by atheism. Transition from a religious consciousness to an areligious one represented a rupture whose depth remains yet to be ascertained. Muzaffar arrived at atheism and then communism or both came to him together. Atheism did not follow communism, as Nigam holds. But then failure to understand this in the late 20th century reflects not just confusion about the past but also present dangers. Nigam would do better to reserve terms like 'pathetic', 'desperate', 'frivolous' and the overall patronising and derisive tone to himself rather than Muzaffar, who at least had the rare courage to reject 'community', 'nation' and the politics based on them at a time when most freedom fighters succumbed to one or both.

If we are to resist the politics of hindutva, the significance of the rupture between individuals like Muzaffar, on the one hand and their 'community' and 'nation' on the other has to be recorded. Mainstream nationalism in Bengal, dominated by the Hindu 'bhadralok', excluded the interests of the common people, mostly peasants. Muslim separatism, a reaction to bhadralok domination mobilised Muslim peasants but worked in the interest of the elite. Since both streams let down the masses and were inextricably linked to 'community consciousness', Muzaffar Ahmed was repelled by both. It was precisely because he could detect the congress of elite-interest and communal/national politics that he turned to communism. This sensitivity is evident in the autobiographical passages on his early life.

SUCHETANA CHATTOPADHYAY

Calcutta

Caste in Census

MY friend, veteran demographer-anthropologist, B K RoyBurman's knowledgeable comment (December 12-18, 1998) remains open to dissent or caveats. The dynamics of market, globalisation and sanskritisation in recent decades has surely changed things a great deal since the censuses of the early decades of independence. His statement towards the end of his note about the difficulties of comparison of caste data between the various censuses strengthens, I think, rather than weakens the case for some fresh data should be in census or through other specially sponsored sample studies is a matter for expert determination. His point about the long time lag between data collection and its availability in any usable form, published or otherwise is well taken. But even with a time lag, extrapolation from more recent data would be more scientific than exclusive reliance on the valuable material, he already knows, is available.

Much of the aversion to collection of fresh caste data has come from social scientists of known anti-reservation inclinations. Let not the logic of this matter be subject to such or opposite biases. He is right about the social tensions attending upon such investigation in today's India. But not knowing the truth could lead to greater tension and violence on other occasions, but caused essentially by the same cause, overlooking caste handicaps and advantages. Certainly, a problem with all ascriptive categories like caste is that their recognition or enumeration tends to harden and perpetuate them. But then overlooking them is no solution either.

S SHUKLA

New Delhi

Food for Thought

THE budget season has produced many reviews of the economy. But not much attention is being paid to the recent trends in the production and consumption of foodgrains. Looking at production, it is worth recalling that net production per head had reached a level of about 450 grams per day even as early as 1961. That level would be enough to feed the whole population by acceptable norms, but for the extremely unequal distribution of income that leaves many in chronic hunger. True, net production per capita has crossed the 450 grams level, going above 500 in a few years during the 1980s and 1990s. But hunger and poverty persist. On the whole, irrespective of how the trend rates of growth are computed, large fluctuations are still the order of the day. Fluctuations fuel inflation.

Output growth for the country as a whole during the 1990s has been below the rate of population growth. So production per capita is exhibiting a declining trend. With impressive growth concentrated in a few states – for example, in the north-west during the 1970s and the east in the 1980s – for most states the story is one of a steady fall in output per head for two decades or longer. In large parts of rural India, where markets have not developed adequately, people eat well when the local harvests are good. All villages supply grain to the outside world, but not many get flows in the reverse direction. In particular, long distance trade does not augment supplies in rural India, especially in pockets of deficit and poverty. In consequence, when production declines, so does consumption.

Data on recent trends in consumption show some remarkable changes during the last two decades or so. The proportion of expenditure on food has been declining, and within the food group, a shift has been taking place in favour of costlier items such as milk and milk products. Symptomatic of this is the observed decrease in the consumption of cereals, even in quantitative terms. Economists have been attributing these changes to income growth and the consequent working of Engel's law: as incomes rise, people spend smaller parts of their income on food. That may well be true in respect of the middle and upper income groups. But the most striking aspect of the observed changes is that they are noticeable even in the bottom-most expenditure groups. Economists are concluding that taste patterns are changing – even among the poor.

Can we uncritically accept these conclusions? There is a puzzle to be resolved. If we define poverty through a food norm, directly or indirectly, the question that arises is why the poor are cutting down on food consumption from levels already deficient, spending more in proportionate terms on items of consumption other than food. The fallacy arises in part from the fact that we are not looking at the same groups of people separated by two decades. We are comparing the poor then with the poor now. Indeed the nature and range of consumption of non-food items have also been changing, even for the poor. It is possible that what is a basic minimum in respect of necessary items other than food has also changed radically. (For example, the poor now spend more on education and health than the poor did in the 1970s.) More importantly, as some suggest, the data on food intake perhaps do not adequately capture food consumed outside home, especially among working people. Finally, there is the matter of availability and prices of different foodgrains. In many regions of the country, the production of inferior cereals has been steadily going down and the consumption of superior cereals – rice and wheat – costlier than other grains, such as jowar or bajra, may simply be a reflection of the disappearance of inferior grains.

Whether demand models employed by economists fully capture the reality of prices and availability of food and the non-existence of markets is certainly a matter for further debate. What makes it difficult to accept the low food intake among the poor as a reflection of a new taste pattern is that if the prices are low the poor will eat better. This is amply demonstrated by what has happened in Andhra Pradesh, where poverty ratios have dramatically declined, thanks to subsidies for food provision. It is easier perhaps to accept the low food intake as a conscious choice among the poor. But then we must revise our notions about the poverty line. We can thereby alleviate poverty through statistics.

NATO ATTACK

UN Diminished

THE failure of the United Nations Security Council to approve of the Russian resolution demanding immediate stoppage of NATO's aerial attacks on Yugoslavia raises a number of serious questions. The immediate question however is whether hereafter a nation or a group of nations can attack another sovereign nation, not because the Security Council authorises such action or because such action is taken in self-defence, but because the invading nation or group of nations considers it necessary and justified. In this particular case, the justification offered is that such action was necessary in order to prevent a humanitarian catastrophe. But should not the prior mandate of the Security Council have been obtained before undertaking the type of lethal action in question? Why was the Security Council sidelined? Particularly when the Council had been seized of the humanitarian tragedy unfolding in Kosovo through a resolution passed only in September 1998 calling for an end to the Yugoslav offensive against Kosovo's Albanian population, but without sanctioning the use of force.

It is noteworthy that at every stage the UN was deliberately kept out of the negotiations immediately preceding the present air attacks, possibly because the NATO combine in general, and the US in particular, anticipated strong disapproval of military action, because such action would raise complex questions about the use of force against a sovereign country in order to make it agree to an arrangement within its recognised borders unacceptable to the government in power. This could have far-reaching implications for international order. It is disappointing that UN secretary general Kofi Annan did not take the earliest opportunity to voice his opposition to the manner in which the UN was being sidelined. Even the government of India failed in not having raised its voice sufficiently early against the coercive methods being applied by the NATO combine, under Anglo-American leadership, on Yugoslavia.

However paramount the protection of the rights of minority peoples within a country, this objective cannot be allowed to be used, and that too selectively, as the basis for violating the territorial integrity of a sovereign country. It cannot be overlooked in this context that within NATO itself repression against minorities has been glossed over. Does Turkey's repression of the Kurds which forced as many as a million, if not more, Kurds to flee their homes not amount to a humanitarian catastrophe? In the US backyard, Columbia has been witness to mass refugee flights on account of state repression. That there are skeletons in NATO's cupboard cannot be denied. How then can anybody take NATO's humanitarian concerns seriously and accept it as the upholder of humanitarian objectives?

What is most regrettable about the NATO aerial action against Yugoslavia is that, as a consequence of this action, the UN gets badly diminished, in terms of its authority and prestige. It is a danger that the international community cannot afford to overlook. The decline of the authority of the UN is bound to lead many people, particularly those who have always advocated unilateralist security positions, to argue for independent security arrangements which will inevitably result in the revival of arms race. Those who had hoped for a peace dividend after the end of the cold war have now to get ready to see their dreams shattered, because with the end of the cold war and the emergence of a unipolar world dominated by US, there is no knowing when any country may incur US displeasure and become a victim of its military action in one garb or another. The result is also an extremely unstable world, which must eventually lead to the formation of other groupings of countries as countervailing centres emerging to withstand the dominance of one power. The only people who would welcome such an outcome would be those with a stake in the military-industrial complex whose peace nightmares would thus be ended. All others must work to stop this eventuality.

BJP

Showcasing Crime

ANY government at the centre with a sense of shame would have had some qualms in celebrating one year of its rule at this juncture. But trust the BJP for its unflinching brazen-facedness. The Rs 1.5 crore bash in the Hauz Khas monument grounds in New Delhi to observe the first birth anniversary of the BJP-led government on March 19 was held at a time when the country was reeling under the worst crime wave that India had ever seen before. The last year, if anything, had proved that there was nothing that by any stretch of imagination could be called law and order.

According to home ministry sources the crime graph all over the country had gone up. During the last year at least 38,000 murders were committed, 60 per cent of which took place in Uttar Pradesh, Madhya Pradesh, Bihar and Andhra Pradesh. During the same period over 15,000 rapes were reported from different parts of the country. The metropolitan cities took the lead in murders, rapes, abductions, extortions and other crimes. The capital, New Delhi, led with the highest crime rate of 59,000 incidents during the last year. While his party was preparing for the birthday bash, union home minister L K Advani announced in the Rajya Sabha that the capital had far outstripped other metros in the number of heinous crimes – including rape, murder, robbery and abduction. Incidentally, for the most part of the last year, the capital was ruled by the BJP – till its defeat a few months ago. Even today, the capital's police administration is under home minister Advani. In most of the cases of murder and robbery, the police still remain clueless and are yet to apprehend the guilty. At least five journalists have been killed during the year and none of the cases has been solved so far.

In Mumbai, capital of another state ruled by the BJP with its ally Shiv Sena, the mafia has come overground and ruling the roost by indulging in smuggling, prostitution, extortions and contract killings. More than 10,000 people are reported to be finding sustenance from the four major mafia gangs that operate in the city.

What is significant in the latest crime reports is the increasing participation of first timers and youth from affluent families. The Delhi crime statistics indicate that 90 per cent of the robberies over the last year were committed by first timers, most of whom were below 30 years of age. One-third came from middle class background, and almost 40 per cent were school educated. Reports from other Indian cities suggest a similar composition of the new generation of criminals, with a significant part of them belonging to economically powerful and socially influential urban classes. Quite a large number of these criminals, particularly murderers, were found to be scooter-borne or driving trendy cars, possessing cell-phones, and were either connected with politicians, or came from upper class families. Some of the murders were committed because of

family disputes over the possession of properties.

These facts should lead us to question the hitherto glib assumption that the prime reasons for the increasing crimes in Indian metropolitan cities are poverty, over-population, migration of job-seekers, proliferation of slums, unemployment, etc. While economic needs do often drive the poor and the jobless to crimes like theft and robbery, a new breed of young well-to-do criminals is emerging whose activities are no longer confined to white-collar crimes (which their fathers indulged in to amass the fortunes on which these spoiled sons are thriving), but are extending to heinous crimes like murder of rivals from their own peer group, revenge killings, abduction and rape of women whom they fancy – or, hijacking a car and killing its driver just for a lark! It is significant that the scenes of such crimes are usually the college campuses, bars in five-star hotels, extravagant parties, or posh localities. Unlike the poor criminals, these pampered children of the rich are not taking to crime for money, but for other various reasons. Unlike the petty criminals again, they have full confidence in their ability to get away because of their clout in the higher echelons of the police and the administration. Demonstrative disregard of law with them becomes an aggressive statement of their status in society.

It is not surprising therefore that the BJP, under whose regime in the centre such disregard of law can surge unabated, would show a similar disregard for public sentiments by foisting a tawdry extravaganza in front of a historical monument to celebrate its one-year rule, and flout the objections raised by the local citizens, environmentalists and archaeologists.

BIHAR

Unrealistic Solutions

DESPITE having become the order of the day, the arbitrary mass killings in Bihar have not ceased to evoke horror and revulsion each time they are perpetrated. More innocents seem to be destined to be mowed down in the aftermath of the bout of violence that engulfed Shankarbhiga, Narayanpur and Senari, as threats of retaliation are issued by the landlord armies and the naxalite outfits from their respective hideouts. The state machinery having long abdicated its duty of maintaining law and order and the rudimentary task of providing public services, an overwhelming sense of futility pervades Bihar as it lurches into further anarchy. It is against this background that the multi-crore relief and reconstruction packages announced by the central and the state governments separately, instead of providing assurance, generate all round scepticism.

If history is anything to go by, the declared intentions as mentioned in the recent package, of modernising the police force, speeding up the clearance of long-pending legal cases involving land disputes, generating rural employment, providing electricity and drinking water, are reiteration of old objectives which never saw the light of the day. The attempt to boost the morale of the police by setting up additional checkposts, beefing up the police personnel and updating communications and transport facilities is likely to make little dent when it has been repeatedly revealed that massacres have taken place in spite of the police being forewarned, the police stations being well armed and staffed, and at a stone's throw from the site of massacre. In the recent case of beheading in Senari, 28 companies of the central reserve police force and Bihar military police were stationed in Jehanabad district. What such relief measures fail to take cognisance of is that in the absence of political will to root out lawlessness, no amount of infrastructural support will help resuscitate a paralysed police force. Given the numerous occasions the perpetrators of crime remain to be arrested or are arrested only to be released on bail subsequently, it does not come in the least bit as a surprise that the Ranveer Sena, despite being officially banned in July 1995, a year after its formation, has continued with its gruesome killings with greater frequency.

The present package claims novelty in awarding the authority of implementation to the bureaucracy rather than the politicians. Though this can be considered a reflection of the extent to which politicians of all shades in Bihar have lost the trust of the masses, the decision to empower the bureaucracy overlooks the deep nexus between bureaucrats, politicians and criminals that has corroded the government machinery. The various scams unearthed in Bihar have disclosed that the BDOs, district collectors and department secretaries by cornering government contracts have been involved in amassing wealth for themselves and their political masters. Moreover, in the absence of the panchayat elections since 1978, there is no popular control over utilisation of rural development funds. The road development activity on which the present package places so much stress in order to improve police reconnaissance, besides being a time-worn suggestion, has been embroiled in massive misappropriation of funds. The huge investment in road construction which the package proposes, if it ever comes through, is sure to meet the same disastrous fate previous schemes have suffered.

It has always been made out that the Bihar problem is not merely of law and order but is inextricably linked to skewed land ownership pattern that prevails in the state. Though there is a grain of truth in this argument, the ground reality in central Bihar where most of carnages are taking place, exhibits a different pattern. Though 80 per cent of land is owned by upper castes and upper backward castes in the central Bihar districts, unlike north Bihar, there are few large landowners in the region. Yet the agricultural prosperity of relatively irrigated central Bihar has bypassed the landless dalits who in the absence of industrial development, are condemned to eke out a living on the farms of upper and intermediate caste landowners. In fact, landlords owning 300-400 acres of land are to be found in north Bihar, but since they largely happen to be yadavs, Muslims and rajputs, Laloo Prasad Yadav, despite making noises against them at the beginning of his first tenure as chief minister, has protected their landed interests. But the industrial development in north Bihar districts has enabled the dalits to free themselves from the yoke of agrarian feudalism and thus pre-empted this region from witnessing gory carnages which have become a regular feature of central Bihar. Hence, the speedy settlement of land disputes as envisaged in the package has little to do with central Bihar where the lines of conflict run around totally different axes. It is not for no reason that Laloo Yadav has termed the recent spate of violence as one for 'maansamaan' (dignity), though it only happens to be a shrewd ploy to shirk his responsibility. The very fact that innocents are being targeted indicates that the mayhem in central Bihar is driven more and more by the logic of vengeance and has less to do with struggles for dignity, minimum wages or land distribution. It is another manifestation of chaos into which Bihar has descended and which, unlike the government package, offers no easy solution.

CURRENT STATISTICS

EPW **Research Foundation**

Foodgrains production is expected to cross the 200 mn tonnes mark in 1998-99 due to a good rabi crop which is expected to touch a record 70.6 mn tonnes against 66 mn tonnes in 1997-98. Pulses-output is expected to touch a record 15.2 mn tonnes. Despite lower output, procurement from the 1998 wheat crop was higher and with further acceleration in procurement from the latest kharif and rabi crops, total stock of rice and wheat as on April 1 this year is expected to exceed the buffer requirement of 15.8 mn tonnes by 5 mn tonnes. Commercial crops like oilseeds, sugarcane and raw cotton are also expected to perform much better than in the previous year.

ITC

Streamlining for Growth

TOBACCO major ITC puffed off an encouraging performance during 1997-98. While the company's net sales was higher by 9.2 per cent over the previous year, 1996-97, operating profit improved by 25.9 per cent and the company's net profit jumped by 51.7 per cent over the same period. Encouraged by its performance, the company raised the dividend rate from 40 per cent last year to 45 per cent. While earnings per share was up to Rs 21.4 from Rs 14.1, book value moved up from Rs 52.5 per share to Rs 69 per share. At a time when other businesses seem to be struggling to retain their toe hold on the market, ITC seems to be going from strength to strength. After posting good results for the year 1996-97, the company has repeated its growth performance during 1997-98. The company maintained its leadership position in all the cigarette segments. In fact, in order to capture the foreign cigarettes segment – estimated at Rs 250 crore and growing at 25 per cent – ITC has tied up with its parent, BAT, for the manufacture and marketing of two international favourites – Benson & Hedges and State Express 555. The company has also embarked on an expansion and modernisation plan which is expected to further fuel growth. While its leaf tobacco exports registered a growth of over 62 per cent in value terms and 37 per cent in volume terms, its packaging and printing business also performed well and the company was able to consolidate its position as the industry leader. In a bid to disengage itself from non-profitable businesses which were a drag on profitability, the company hived off ITC Classic and sold off its stake in the seeds business, in addition to reducing its stake in the edible oils business. The company now plans to focus on four major areas – tobacco, hotels, printing and packaging, and paper.

The company has signed a memorandum of understanding (MoU) with Lawson Mardon Group of Alu-Suisse Lonza covering a security and back-up arrangement for printing and packaging of ITC's BAT brands. The company's printing and packaging division is today the country's largest manufacturer of value-added folded cartons, meeting the packaging needs of a variety of brand leaders in domestic and export markets covering industries like tobacco, liquor, tea, foods, detergents, personal products and matches. The company enjoys a good discounting at the stock market with its share quoting at Rs 990 on the bourses, which gives a price to earnings multiple of 46.2.

ESCORTS

Successful Restructuring

The flagship company of the Rs 3,000 crore Nanda group, Escorts, experienced a mixed performance during the year 1997-98. While the company net sales declined by 14.5 per cent over the previous year, operating profit remained stable at last year's level. Lower interest (down 16.2 per cent) and tax provision (down 16 per cent) helped the company post a marginally higher net profit during the same period. The company's poor performance is reflected in the poor discounting it is granted on the stock market with its stock quoting at a price to earnings multiple of three.

In a bid to revamp its image the company now plans to convert 50 per cent of its equity capital into cumulative redeemable preference (CRP) shares. The CRPs will have an interest rate of 12 per cent and have a face value of 90 per cent. They will be fully paid at par and have a tenure of seven years with an average of six years. The CRPs will be redeemable at par at the end of the fifth, sixth and seventh year from the date of allotment. Moreover, the company retains the option to redeem them at any time at the end of four years from the date of allotment under a call option. The CRPs will also be listed and tradeable. The move is expected to enhance the value of shareholders' holdings as also the cash flow to them by way of dividend and through return of capital on redemption of the CRPs. Excorts proposes to utilise reserves worth over Rs 280 crore to return equity to shareholders who have to date contributed Rs 154 crore in the form of equity and premium. Further, the company believes that the cut in equity will improve the price to earnings multiple which in turn maximises the wealth of the shareholders. The restructuring exercise carried out earlier was a move to realign its focus mainly because the company had diversified into too many areas which included agro machinery, construction equipment, telecom, automotive components, two-wheelers, chemicals and finance. In addition, the presence of another group company in tractors also sent out conflicting signals to investors. The restructuring move envisaged consolidation of the group's agro machinery business under Escorts. The company has divested the leather chemicals business and hived off its two-wheeler and automotive components division into separate joint ventures. The overall recession is expected to catch up with the domestic tractor industry soon. However, in a bid to tackle the slowdown and the threat from multinationals, Escorts is forging a series of overseas alliances for its tractor business. Apart from a technology tie-up with Carraro of Italy, the company has entered into a MoU with a US-based tractor distribution firm. Through this, Escorts is planning to market its higher HP tractors globally and offset the sluggishness in the domestic market.

ARVIND MILLS

Shifting Fortunes

The flagship company of the Lalbhai group, Arvind Mills performed poorly during 1997-98. Though the company's net sales was higher by 7.8 per cent over the previous year, 1996-97, operating profit suffered and was lower by 16.2 per cent. Even a sharp fall in interest charges (down 27.7 per cent) was not enough to offset the increase in depreciation (up 25.9 per cent) and tax provision (up 52.2 per cent), and the company's bottomline was lower by 20.7 per cent over the same period. With earnings per share falling from Rs 12.7 to Rs 10, the company decided to cut the dividend rate from 45 per cent in 1996-97 to 25 per cent during the year under review. Book value, though, coursed

NA: means not available

along at Rs 114.5 per share, up from Rs 107.3 per share at the end of the previous year. The company's stock presently quotes at around Rs 32.5 on the bourses, discounting its 1997-98 earnings by a mere 3.25 times. During the year, denim sales accounted for 61 per cent of the turnover of the company while exports accounted for 44 per cent. The company's key business was hit badly in both the local and export markets due to the Asian crisis and slowdown in domestic demand. The shift in the consumer preferences, particularly in the US, from denim to chinos, gabardine and other casual fabrics is said to be responsible for the company's poor fortunes in the export market. Overcapacity in the Indian market and slack export markets affected the company's bulk fabric and branded garment sales, reportedly resulting in a pile-up of processed fabric estimated at Rs 125 crore. Reports even claimed that another Rs 15-18 crore worth of stock could be stuck with converters (intermediaries who manufacture and distribute the company's branded Ruf-n-Tuf jeans). Stocks of Newport jeans, worth about Rs 30 crore were also said to be lying with the company. The branded garment business contributed about 16 per cent of the turnover, and the company continued to derive considerable business from its treasury operations. The company implemented its 40 million metres per annum rope denim project at Santej in Ahmedabad during the year, and the other projects at the same location comprising expansion of the cotton shirting facility, a new knit fabric unit and captive plants were at advanced stages of completion. The total cost of the above projects is estimated to be around Rs 1,000 crore and most of it is being funded through debt.

Meanwhile, the promoters, Lalbhais, have increased their holding in Arvind Mills to 21.07 per cent by acquiring 2,11,89,758 equity shares of the total current equity capital of Rs 150 crore (increased after March 31, 1998). In another move, the company also planned to issue 50 lakh preference shares of Rs 100 each, aggregating Rs 50 crore to meet the working capital and capital expenditure needs. The company's move has been initiated in view of its expansion plans, and also for general corporate purposes. The authorised capital has reportedly been increased from Rs 150 crore to Rs 260 crore to incorporate the increase in capital.

Maharashtra Budget: More Questions Than Answers

Madhav Godbole

In the pursuit of populist policies the Maharashtra government has taken several hasty decisions which do not augur well for the financial health of the state.

THE annual financial statement of the government of Maharashtra for the year 1999-2000 was presented in the state legislature on March 22, 1999. The budget was anxiously awaited for a number of reasons. The first is the critical financial position of the state government which is causing concern among the discerning citizens, thinkers and public policy analysts, though the state government has so far been totally oblivious to it. It was expected that the coalition government would at last take note of these serious concerns in the budget and present a set of time-bound remedial actions. Second, this is the last budget of the Shiv Sena (SS)-Bharatiya Janata Party (BJP) coalition government as the elections to the state legislative assembly are scheduled to be held in February 2000. The budget was, therefore, expected to give a decisive direction to the state's development efforts so as to ask for a fresh mandate from the people. Third, this is the first budget after the setting up of the Eleventh Finance Commission (EFC). It was expected that the state government would show a seriousness of purpose in setting its financial house in order to make out a strong case for larger assistance from the EFC. Unfortunately, the budget has belied all expectations and has raised more questions than what it has answered.

It will be useful to begin the discussion by briefly summarising the main features of the budget. The budget estimates for 1999-2000 anticipate an all-time high deficit of Rs 1,095.31 crore, with unprecedented revenue deficit of Rs 7,971.93crore, capital account surplus of Rs 1,708.43 crore, and public account surplus (net) of Rs 5,676.74 crore. The deficit is proposed to be made good by resource mobilisation proposals (Rs 720 crore) and gearing up of the tax collection machinery and tightening up various economy measures, especially on the non-Plan revenue account side (Rs 300 crore), resulting in the reduction of the deficit to Rs 75.31 crore

The analysis of the financial position of the government brings into sharp focus a number of disturbing features. Revenue deficit has recorded a steep increase during the last few years. The deficit has gone up from Rs 609.11 crore in 1995-96 to Rs 1,590.56 crore in 1996-97, Rs 2,579.94 crore in 1997-98, Rs 2,741.64 crore in 1998-99 and Rs 7,971 crore (BE) in 1999-2000. Interest payments have increased from Rs 2,903.59 crore in 1997-98 to Rs 3,607.60 crore in 1998-99 and are estimated to go up to Rs 5,082.34 crore in 1999-2000. Revenue expenditure is slated to go up steeply from Rs 22,896.51 crore in 1997-98 to Rs 24,872.36 crore in 1998-99 and Rs 32,209.08 crore in 1999-2000 (increase of 29.5 per cent over the previous year). The annual growth rate in total expenditure on revenue account was 16.4 per cent between 1980-81 to 1990-91. Between 1990-91 and 1999-2000, the corresponding growth rate is estimated to be 15.6 per cent. Both these rates are much higher than the rates of growth of revenue in the corresponding periods. Interestingly, during the period 1990-91 to 1999-2000, the annual growth rate of expenditure on (i) agriculture and allied activities is 6.1 per cent, (ii) administrative services is 23.9 per cent, (iii) education, sports, arts and culture is 15.3 per cent, (iv) health and family welfare is 12.6 per cent, and (v) debt services is 17.7 per cent. Thus the highest growth rate is of expenditure on administrative services, followed by that on debt services. The per capita expenditure on revenue account was Rs 2,555.06 in 1997-98. It is expected to increase to Rs 2,724.89 in 1998-99, i e, by 6.6 per cent over 1997-98 and further to Rs 3,464.85 in 1999-2000, i e, by 27.2 per cent over 1998-99.

The capital expenditure is languishing at Rs 4,355.70 crore, Rs 4,448.57 crore and Rs 4,009.34 crore, respectively in these years – a projected decline, even in nominal terms, in 1999-2000. The per capita expenditure on capital account is likely to increase from Rs 358.41 in 1997-98 to Rs 397.45 in 1998-99. The same is, however, expected to decrease to Rs 351.53 in 1999-2000.

There was a big jump in anticipated Pla expenditure in 1998-99 (Rs 11,638.8 crore) as compared to the preceding yea 1997-98 (Rs 7,936.70 crore). This wa due to large recourse to loan funding c the Plan resorted to by the state govern ment. However, the outlay for the annua Plan for 1999-2000 is of only Rs 12,161.6 crore as against the outlay of Rs 11,60 crore for the previous year. Thus the outla for the year 1999-2000 is just 4.8 per cen higher than the outlay for the previou year (this percentage is even lower i terms of the anticipated actual expendi ture), signifying a decline in real terms Of the total outlay, only Rs 6,641.82 cror (54.61 per cent) forms part of the stat budget. It is necessary to note that thi amount also includes loan funds receive towards externally assisted projects, an central sector and centrally sponsore schemes. The balance amount o Rs 5,519.84 crore is to be met from th resources of the statutory bodies like th Maharashtra State Electricity Boar (MSEB), Maharashtra State Road Trans port Corporation (MSRTC), loans fron the Life Insurance Corporation of Indi for the water supply schemes, irrigatio development corporations, road develop ment corporation, Maharashtra Jeeva Pradhikaran and Mumbai Metropolita Region Development Authority. Most o this amount will be raised by way of loans Thus less than 40 per cent of the tota annual Plan outlay is non-loan funded indicating the severity of the problem o debt creation. Fiscal deficit went up b nearly 23 per cent in 1998-99 (Rs 8,071.7 crore) as compared with 1997-9 (Rs 6,561.68 crore), and is estimated to g up by further 17 per cent in 1999-200 (Rs 9,436.01 crore). Primary deficit to is slated to touch Rs 4,353.67 cror (1999-2000) as compared with Rs 3,658.0 crore in 1997-98. It is further seen that th ratio of revenue deficit to fiscal deficit indicating the extent of borrowing use for consumption expenditure, is estimate to go up from 39.32 per cent in 1997-9 and 33.96 per cent in 1998-99 to un believable 84.48 per cent in 1999-2000

The total debt of the state governmen which was Rs 21,751 crore at the end o 1996-97 increased to Rs 25,870 crore a the end of 1997-98 and the same is esti mated at Rs 30,912 crore by the end o 1998-99. It is expected to increase furthe to Rs 37,226 crore by the end of 1999-2000

Yet another disturbing aspect of th state's finances is regarding the proporatio of the total revenue of the state pre-empte by three sticky items of expenditure

namely, gross interest payments, total salary liability and subsidies. These together accounted for 77.82 per cent of the total revenue receipts in 1994-95. This percentage has gone up rapidly in the following years – 78.82 per cent in 1995-96, 84.13 per cent in 1996-97, and 85.29 per cent in 1997-98. In 1998-99, it is estimated to have crossed 100 per cent.

Due to some significant developments in recent years, the budget of the state government does not reflect the full and correct picture of the finances of the state. At least three factors may be cited in support of this contention. First, in the past, the state alone used to borrow from the market on the basis of its guarantee. In recent years, a number of state government corporations are taking resort to borrowing from the market on the basis of state government guarantees. Thus huge sums are being borrowed by the irrigation development corporations, state road corporation, MSEB and so on. Most of these projects are clearly not self-financing and the final liability to repay the loans, either in full or part, will devolve on the state government. This contingent liability arising from the borrowing of the state government entities is not reflected in the budget. Second, much worse is the borrowing, based on the guarantees of the state government, by non-government entities such as the co-operative sugar factories, co-operative spinning mills, co-operative cotton marketing federation for the loss-making cotton monopoly scheme and so on. The co-operative sugar factories and spinning mills have already defaulted in repayment of loans and payment of interest to all-India financial institutions to the extent of over Rs 300 crore. The state government has been dragging its feet in meeting its guarantee obligations. As a result, these institutions have stopped extending term loans to new co-operative sugar factories in the state since 1995. In spite of accumulated losses of over Rs 1,300 crore, the cotton monopoly scheme has been kept going by the state government by ordering its other corporations to park their surplus funds with the cotton marketing federation and extending loans to the federation from state exchequer which are not likely to be repaid at any time. The seriousness and enormity of this large contingent liability has to be reckoned with in appraising the budget. Third, the state government has given guarantees for the purchase of power by MSEB from the three independent power producers (IPPs), namely, Enron, Reliance and Nippon Dendro. By all accounts, the state will have to bail out the MSEB in fulfilling its power purchase obligations. The concerns regarding this large contingent liability in the coming years are also not reflected in the budget. If these imponderables are taken into account, the finances of the state government are clearly in a crisis situation.

It is indeed unfortunate that the finance minister has been laying the entire blame for the deterioration in the financial position of the state government on the unilateral decisions of the central government on the recommendations of the Fifth Pay Commission. While the profligacy on this account cannot be lost sight of, the budget does not seem to take any cognisance of the veritable time bomb which is ticking away inexorably.

Poor Resource Mobilisation

It will be useful to examine in this context the performance of the state in respect of resource mobilisation. All available data show that the efforts of the state government in this regard are much less than are warranted in the above situation. Maharashtra occupied the first place among 14 major states in respect of per capita tax revenue in 1996-97 and 1997-98. However, this primacy was lost in 1998-99 (BE) when the state slipped to the fourth position. Significantly, on the basis of the ratio of tax revenue to state domestic product (SDP), which shows the potential of the state to raise revenue, in 1996-97 (latest year for which comparable SDP data are available), Maharashtra ranked only fifth among 14 major states. Even after taking into account the revenue from octroi, which is levied by municipal bodies, this picture may not change to any appreciable extent.

The performance is equally disappointing in respect of all major taxes. As regards the per capita sales tax revenue, Maharashtra occupied the fourth position among 14 major states in all the three years, namely, 1996-97 1997-98 and 1998-99 (BE). In respect of sales tax revenue to SDP ratio for 1996-97, Maharashtra was only at the sixth position. In respect of per capita state excise revenue, Maharashtra was at the sixth position in 1996-97, third in 1997-98 and seventh in 1998-99 (BE). On the basis of the state excise revenue to SDP ratio for 1996-97, Maharashtra was only at the eighth position among 14 major states. In respect of the per capita revenue from the taxes on vehicles, goods and passengers, Maharashtra was at the fifth position in 1996-97, third in 1997-98 and eighth in 1998-99 (BE). As regards this tax revenue to SDP ratio for 1996-97, Maharashtra trailed at the 10th position among 14 major states.

Of the total receipts on revenue account, non-tax revenue accounted for only 20.5 per cent. Of this, excluding interest receipts (4.8 per cent) and grants-in-aid from central government (7.9 per cent), "other non-tax revenue" accounted for only 7.8 per cent. Interestingly, the revenue from this source is estimated to be smaller in 1999-2000 than even in 1997-98 and just marginally higher than in 1998-99.

The performance of the state public sector enterprises has been most disappointing. According to the report of the Comptroller and Auditor General of India on the state government for the year ending March 31, 1997, the state government's investment in the share capital and debentures of various statutory corporations, government companies, etc, at the end of 1996-97, was Rs 1,874.18 crore. The dividend/interest received during the year was Rs 9.27 crore only, representing a meagre return of 0.49 per cent. Thirty-five companies, in which the government investment in equity was Rs 187.19 crore, had accumulated losses of Rs 343.41 crore during the years 1986-87 to 1996-97 for which the accounts were finalised.

The budget does not deal with any of these issues insofar as revenue mobilisation is concerned. On the contrary, the state government has taken the most retrograde step by proposing the abolition of value added tax (VAT) system. The relevant portion of the speech of the finance minister is cleverly worded to give an impression that the committee appointed by the state government under the chairmanship of Narayan Valluri had recommended this course of action. The relevant paragraph of the budget speech reads as follows: "The committee has *taken a note of* (emphasis added) the following problems faced by tax payers – (i) VAT has imposed an onerous burden on tax payers in terms of accounts keeping, which small dealers find difficult to comply with. (ii) The multiplicity of rates combined with VAT has complicated filing of returns for resellers. (iii) The experience of Tamil Nadu and Kerala government which introduced VAT shows that they were not happy with it and have either abandoned or kept it in abeyance. (iv) VAT system is not suitable for Maharashtra."

At the outset it needs to be noted that there is nothing special about Maharashtra, as compared with the manufacturing and trading activities the world over, and VAT ought to have been given a fair trial in a so-called progressive state such as Maharashtra. In fact, implementation of VAT was considered a feather in the cap of the Maharashtra sales tax administration by knowledgeable observers and institutions both in the country and abroad. Any new taxation system is bound to face

teething troubles. Some decline in the rate of growth of revenue, in the short run, also cannot be ruled out; but the Maharashtra administration has the requisite innovativeness to deal with these issues in a constructive manner. Instead of doing so, the state government has, for inexplicable reasons, taken the hasty and short-sighted step of abolishing the VAT system altogether. This will have long-term adverse implications for the rationalisation and reorganisation of the commodity taxation not only in Maharashtra but in several other states in the country.

What is shocking is that the committee under the chairmanship of Narayan Valluri had not recommended the abolition of VAT at all. It had recommended an alternative, for adoption in the short term, which would reconcile the conflicting demands put forth by various interested parties and suggested the continuation of the levy of tax as at present, at the first point of sale, at the existing rates (or as modified and revised in the light of the committee's report or otherwise). However, subsequent sales (which were to be subject to VAT) were not to be taxed at the rates applicable to the individual commodities but at a single rate of tax levied on the basis of the subtraction method, i e, on gross value of sales less cost of purchases (including freight, octroi, etc). And the threshold limit for registration of dealers was to be brought down from the current Rs 40 lakh to zero. The committee had specifically underlined that this course of action will have the advantage because: (a) it is not a reversal of the track to the earlier system of first stage single point tax; (b) it addresses the concerns flowing from the opposition to VAT; and (c) it does not try to adopt a full-fledged VAT system before one is fully equipped or ready to do so. At the same time, initiatives can be kept alive to move towards a full-fledged VAT as recommended by the Committee of Finance Ministers. The state government should have published the report of the committee for a wider debate before announcing its decision on the subject. It is unfortunate that the VAT system in Maharashtra has fallen a prey to the single point programme of the state government to pursue populist policies, even by sacrificing the long-term interest of the state.

Equally disconcerting is the hasty manner in which the decision to abolish octroi in 'A', 'B' and 'C' class municipal councils has been announced in the budget. The finance minister has quoted a long list of the reports of the committees which had recommended the abolition of octroi. But, he has, inexplicably, failed to refer to the most important committee (P D Kasbekar Committee) on this subject, from the perspective of Maharashtra. This committee, of which this writer was a member, in its report submitted in October 1987, had, *inter alia*, recommended that octroi should be abolished and in its place an account-based entry tax should be levied. The committee was particularly anxious that the state government should not undertake to meet the loss of revenue of local bodies, due to the abolition of octroi, from its own limited financial resources which were already under considerable stress. The committee had further emphasised that a separate earmarked fund should be created to ensure timely reimbursement of losses of the local bodies from the revenues of the entry tax to be levied by the state government. These well-considered recommendations have been overlooked by the state government. Instead, the finance minister has announced that octroi in the above categories of urban local bodies will be abolished and the state government will reimburse the loss to these bodies from its own resources for the next four years. Apparently, it is presumed by the finance minister that thereafter these bodies will be able to stand on their feet without state government support.

The experience of other states such as Karnataka in this regard should have made the state government wiser. The local bodies in these states were at the mercy of the state government and did not even have funds to pay the salaries of their employees. The development works in the urban areas in these states suffered a great deal. As brought out earlier, the record of Maharashtra in terms of mobilisation of revenues has been poor. In this situation, to give up an important source of revenue such as octroi, without taking recourse to any alternative revenue raising measure, is foolhardy. A number of other very valid objections can be raised regarding the decision of the government to abolish the octroi by taking recourse to populist stance as the traders in Maharashtra had stoutly opposed levy of entry tax. All along, they wanted the octroi to be abolished without levy of any other tax, and were thereby asking for reduction in the tax burden. In view of the forthcoming elections in the state, the ruling coalition has sacrificed the interests of urban local bodies as also the state by conceding this demand of the trading community which had been consistently rejected by the state government for the last two decades. It is interesting that all this is being done when the state government is on the verge of financial bankruptcy.

A reference may be invited in this context to the recommendations of the first report of the state finance commission. This commission was appointed in the light of the 73rd and 74th amendments of the Constitution. The commission submitted its report to the state government on January 31, 1997. The state government took an unconscionably long time of nearly two and quarter years to examine the recommendations and finally placed the report of the commission along with the action taken report on the table of the legislature in March 1999. The report of the commission makes very disappointing reading. It is unfortunate that most of the members appointed on the commission had an inadequate understanding of the issues nor did they have a clear vision or perspective for the future. The state government's action taken report is equally perfunctory. It is indeed a sad commentary that in the most urbanised state in the country and in the state which had taken pioneering steps as early as 1962 to usher in the panchayat raj, the subject has received such cavalier treatment at the hands of both the State Finance Commission and the state government. It was surprising that the finance minister did not have even a word to say on the subject in his hour-long budget speech. As compared to the total estimated revenue receipts of the state government, to the tune of Rs 24,237.15 crore, for the year 1999-2000, the budget makes an ad hoc provision for only Rs 298.48 crore for assistance to local bodies in pursuance of the recommendations of the State Finance Commission. This is eloquent testimony of the state government's commitment to the cause of democratic decentralisation.

The finance minister has once again taken recourse to increasing the tax on petrol by 44 paise per litre and on diesel by 63 paise per litre. With this latest increase, the prices of these products in Maharashtra are perhaps the highest in the country. Apart from giving impetus to inflationary pressures, such repeated increases in the prices of petrol and diesel raise an important question. The centre has announced its decision to bring the domestic prices of petro products in line with international prices. However, whenever the prices of some of these products are reduced by the centre in keeping with decline in international prices, the states quickly step in and increase taxes on such products, whether it is diesel or aviation turbine fuel. It is time this issue is thrashed out between the states and the centre so that a long-term sustainable policy in the matter can be evolved.

Profession tax was once considered to be an important avenue for the mobilisation of revenue in the state. Unfortunately, over the years, this enthusiasm was waned.

This is partly due to the fact that the revenue from this source is earmarked in entirety for the Employment Guarantee Scheme (EGS). The requirement of funds for EGS has come down over the years, partly due to larger funds becoming available under the employment generation schemes funded by the centre. There are repeated demands in the legislature and elsewhere that the outlay for EGS be increased or the rates of profession tax be reduced. Public interest litigation has also been filed in the Mumbai High Court in this matter. Instead of reviewing the original decision to earmark all revenues from profession tax for the EGS, the state government, under pressure from various lobbies, has been dragging its feet in tapping this avenue fully.

In the budget for 1999-2000, the finance minister has announced certain concessions in profession tax to Hindu undivided family (HUF) and partnership firms on the ground of double taxation. The basis for giving these exemptions is hardly convincing and can be faulted as the constituents of HUF and partnership firms and these legal entities have to be distinguished from each other and treated independently for the purpose of levy of profession tax. The finance minister has announced his intention to fix the liability under the profession tax on the basis of income tax liability. The legal tenability of this initiative is clearly doubtful and needs to be gone into, if the entire revenue from profession tax is not to be jeopardised.

It is amazing that every state finance minister succumbs to the temptation to reduce the sales tax on gold and silver on the specious plea that trade in these commodities will otherwise go out of the state. This time the finance minister has gone a step further and has proposed reduction in the sales tax not only on gold and silver but also on the plastic jewellery boxes. In the name of the poor and the downtrodden, time and again, the budgets seem to serve the interests of well-off sections of society with impunity. This was again borne out by the above decision of the state government taken in following its earlier decision to give sales tax exemption for the Tata's Indica car and large concessions in floor space index to five-star hotels in Mumbai at highly concessional rates.

Populist Programmes

As in the past, the budget contained a number of populist schemes and programmes. The finance minister announced the introduction of Annapurna scheme under which each family below the poverty line will be entitled to 10 kg of wheat or rice at Rs 2 per kg. This is over and above the present scheme under which the state government has undertaken to supply, through public distribution system, five essential commodities at 1994 prices. The decision of the centre in 1998 to increase the issue prices for these commodities has further increased the total financial burden on the state government to Rs 500 crore. Under the new Jijamata Mahila Adhar Yojana, in the case of accidental demise of the head of the family having annual income up to Rs 1 lakh, the widow or son/daughter will be entitled to a lump sum assistance of Rs 25,000 from the government. Under this scheme, 1.6 crore families will be insured and the insurance premium will be paid by the state government. A new Baliraja Suraksha Vima Yojana announced by the finance minister is meant to give financial assistance ranging from Rs 5,000 to Rs 10,000 to those affected by natural calamities.

Some of the give-aways are unfocused and do not have any specific deserving target group. Thus, under the Dr Punjabrao Deshmukh interest subsidy scheme, those farmers who take short-term loans up to Rs 25,000 and repay the same in time, will be given an interest subsidy of 4 per cent by the state government. It is expected that about 20 lakh agriculturists will be benefited by the scheme. As can be seen, the scheme is not confined to small or marginal farmers and covers all farmers, irrespective of the size of their landholdings.

By yet another populist decision announced by the state government just a few days before the budget, the electricity tariff for agricultural consumers has been reduced substantially. The chief minister has announced that this is the first phase and in the second, electricity will be provided entirely free to agricultural consumers. This first phase itself is estimated to lead to the loss of revenue of Rs 181 crore for the MSEB. These announcements are over and above the large subsidies of over Rs 4,800 crore given the state government annually from its budget. In addition are the subsidies amounting to nearly Rs 4,500 crore given to the state public sector undertakings such as MSEB and MSRTC. The finance minister did not refer in his speech to any proposal for review and reduction in the burden of these large subsidies in any manner. The central ministry of power has announced a number of incentives to goad the state governments to set up state electricity regulatory commissions (SERCs). These include reduction in rates of interest on loans from the Power Finance Corporation and the Rural Electrification Corporation. In view of the several critical issues facing the power sector in the state, in general, and MSEB, in particular, it was expected that the state government would make an announcement in the budget regarding setting up of SERC. This expectation too has been belied.

In view of the unsustainable burden of the decisions pertaining to the Fifth Pay Commission, one would have expected some curbs to be announced on new recruitment in the government. Instead the finance minister announced a few days ago that over 1,800 posts falling vacant as a result of the reduction in the age of retirement from 60 years to 58 years would be filled up expeditiously.

The finance minister has announced the setting up of a committee under the chairmanship of chief secretary of the state to examine the question of economising on administrative expenditure. The committee has been asked to submit its report within two months. This kind of tinkering with the problem, as a token gesture, will serve hardly any purpose. What is required is to take a close and critical look at down-sizing the government in its entirety within a definite timeframe. This task can hardly be addressed adequately by a committee of officers.

The chief minister has announced that several new districts would be created, by bifurcating the existing districts, from May 1, 1999. This will lead to a huge expenditure of over Rs 100 crore. The announcement of increase in support price for purchase of cotton under the Cotton Monopoly Procurement Scheme is also in the offing, though the scheme is running into large losses. With all these portents it is not clear how the finance minister is going to bring about large saving in non-Plan expenditure.

A reference may be made to the usual ploy, adopted by all state governments, of applying an across-the-board cut to expenditure during the course of the year in a mindless manner. This often takes the toll of maintenance expenditure. In 1998-99, the budgetary provision for such expenditure in Maharashtra was only about Rs 1,115 crore, with public works department accounting for over Rs 900 crore of the outlay. This was grossly inadequate as compared to the norms laid down by the Finance Commission from time to time. Neglect of capital assets in this manner reduces their life considerably. It is sad to see that not only the capital expenditure has been going down rapidly but even the existing capital assets are not being cared for adequately. The other victim of across-the-board cuts in expenditure is the non-plan development expenditure. Thus there are hospitals but no drugs, there are schools but no teaching aids, and expensive machinery and equip-

ment lying unrepaired and therefore unused. All this can be avoided only by looking at all expenditure critically. In this context, it is unfortunate that the state budget has not taken note of the announcement of the union finance minister to introduce zero base budgeting in the central government from 1999-2000. The state government could have resolved to revert to this system of budgeting which was given up during the regime of Sharad Pawar as chief minister in 1989.

The question of regional imbalance has been in the forefront for over a decade now. The state government had promised to remove the backlog of development, amounting to about Rs 3,500 crore, identified by the fact finding committee under the chairmanship of V M Dandekar in the early 1980s, as soon as possible. Though over a decade has gone by since the announcement was made, the backlog still persists. According to newsreports, a recent committee appointed by the governor, who has been given special powers for balanced regional development under Article 371(2) of the Constitution, has identified a further backlog of over Rs 15,000 crore. The report of the committee submitted in 1998 is yet to be made public. Government decisions thereon are also yet to be announced. But, against this background, it is disappointing to see that the provision made for the removal of backlog in 1999-2000 remains at the same level (Rs 1,100 crore) as in the previous year.

The finance minister has announced that "to maintain fiscal discipline as recommended by the 10th Finance Commission, government has decided to establish consolidated sinking fund from the year 1999-2000". However, this is begging the question. There is no indication how the requisite financial provision for the purpose will be found from year to year. There is no indication of the amount which will be deposited in the fund in 1999-2000. Unless all the details are made public, it is not possible to arrive at any considered judgment on the matter.

There are two other areas requiring urgent attention on the part of the state government. These pertain to the state government laying down a statutory ceiling on its borrowing and the state government guarantees to be given, at any one time, for the borrowing or fulfilment of any other obligations by other entities. These are long overdue reforms and will require firm political will to translate them into reality. Against the above background, Maharashtra budget for 1999-2000 will have to be described as a non-starter. In its quest for short-term, populist solutions, it has failed to address the serious issues facing the state.

Redefining Small Industry: Some Issues

J C Sandesara

The decision to redifine small industry by lowering the ceiling on investment will adversely affect a large number of industries.

ON February 17, 1999 the government of India announced its decision to lower the investment ceiling in small industry to Rs 1 crore from the previous 1997 ceiling of Rs 3 crore (ancillary industry being included in both years). The 1999 ceiling is thus lower by 67 per cent. Investment is defined in terms of investment in plant and machinery (original value). During this period, prices of plant and machinery have increased by 3 per cent, so that in real terms the ceiling stands still lower by 70 per cent.[1] It is of interest to compare this 1999 ceiling with the one announced earlier that year. In 1991, small and ancillary industries had different ceilings of Rs 60 lakh and Rs 75 lakh, respectively. Relative to the ceiling of Rs 1 crore for both in 1999, the increase is of 67 per cent for the former and 33 per cent for the latter. These are monetary increases. During the same period, prices of plant and machinery have risen by 69 per cent, so that in real terms, the 1999 ceiling becomes lower than even the 1991 ceilings in both small and ancillary industries. The fall is marginal in the former, but it is substantial in the latter where the ceiling stands lowered in 1999 to two-thirds of its 1991 level. To put it differently, the monetary ceiling of Rs 1 crore of 1999 for small industry is roughly equal, in real terms, to the 1991 ceiling, while the monetary ceiling of Rs 1 crore of 1999 for ancillary industry needs to be raised to Rs 1.30 crore, in real terms, to the 1991 ceiling. Further, considering that prices of plant and machinery will continue to increase, whereas the ceilings fixed in monetary terms remain that way for quite some time, they need to be fixed higher.

The 1999 lowering of the ceiling is clearly a rollback of economic reforms to push which government has declared its intent repeatedly. Thus for example, *The Economic Survey*, 1998-99 has noted: "Investment controls are the second most pernicious legacy of the control era...The need to replace all quantitative restrictions was recognised even in the 1980s" (p 19, para 80, the first most pernicious controls being identified as price and distribution controls). Still more recently, in his 1999-2000 budget speech, the finance minister declared that to "Deepen and widen economic reforms in all major sectors and accelerate internal liberalisation to release the productive energies of our farmers, manufacturers, traders and service producers" was part of the sixfold strategy followed in framing the budget proposals (para 8).

The decision to lower the ceiling was announced on February 17, 1999. The *Economic Survey* and the Budget presented to the parliament later in the last week of February do not mention this change. Is this just a slip? Did the authors of these documents not know of this change? If they knew it, was it too late to incorporate it in their documents? Is the government reconsidering its decision, and thinking of restoring the ceiling to the 1997 level? In the absence of clarifications from the government, the answers to these questions will remain in the realm of speculations.

The government has not thought through the various implications at the practical level of its decision to lower the ceiling, thus imposing perhaps unintended consequences on all concerned. This decision has the effect of reducing the number of potential beneficiaries of the various small industry promotion schemes of the government. Consider, for example, the three major policy areas. First, lending to units with investment between Rs 1-3 crore will not be classified as priority sector lending by banks/government. Second, the latest budget has announced a number of schemes and concessions in the areas of credit and taxation. Such units will not be eligible for benefits. Third, although of late government has de-reserved a number of items in the reserved category, the number there is still very large, over 800. Such units cannot produce the reserved items. It is hoped that the lower ceiling is not applied retrospectively, so that the units with investment between Rs 1-3 crore established before this ceiling becomes operational, retain their status as small industry, and continue to remain eligible for assistance and benefits available to this sector.

Note

1 The numbers on plant and machinery have been approximated in the following way. For 1991, 1997 and 1999 ceilings, we have used the index numbers of wholesale prices of machinery and machine tools (base year 1981-82) for the years 1990-91, 1996-97 (average of weeks) and 1998-99 (average of April-December) as proxies for prices of plant and machinery. These numbers are, in that order, 180, 295 and 305, thus giving increases of 69 per cent between 1990-91 and 1998-99 and 3 per cent between 1996-97 and 1998-99).

Manipulative Politics Continues

Suhas Palshikar

Though the present ruling alliance of the SS-BJP has not endeared itself to the electorate, sections of the traditional maratha following of the Congress which are not prepared to accommodate the dalits or the OBCs, have become vulnerable to the appeals from the Shiv Sena and the BJP. In such a scenario, the task before the Congress leadership would be to disintegrate the mythical maratha vote and to seek to build new alliance of the poor maratha with other non-maratha castes including the dalits. This will virtually mean writing a fresh text in the politics of the state.

EVER since the Sena-BJP alliance stormed the long time Congress bastion in Maharashtra in 1995, political situation in the state has been in a constant flux. The Sena-BJP victory was a combination of many factors. Apart from unprecedented intra-party revolts in the Congress, this victory was also shaped by the decisive votes of the urban voter against the Congress. The split in the maratha vote also contributed to the electoral defeat of the Congress.[1] Because the victory of the alliance was not based on any positive choice by the electorate, the life of the alliance government in the last four years has always been full of uncertainties and controversies. The recent removal of Manohar Joshi from chief ministership of the state has added further twist to the curious ongoings in Maharashtra. In a swift and decisive move, Bal Thackeray has removed Manohar Joshi and brought in Narayan Rane as the new chief minister of the Sena-BJP alliance. With elections to state assembly barely a year away, this move is apparently intended to attract the rural maratha votes in the next elections. Will this result into a reconfiguration of political forces in the state?

Dilemma Before Maratha Elite

The election in 1995 ushered in a process of realignment of political forces in the state in more than one sense. At the level of the electorate, the maratha vote sizably moved away from the Congress. But after the elections, the maratha elites got a rough deal from the alliance. Resources were poured more in favour of the urban interests, thus further marginalising the maratha leadership. In this backdrop, the move to bring in a maratha chief minister who does not have a following among the maratha community in the state is going to be only a cosmetic change. Whether the maratha voters will fall for such a sop is another matter. Ther real issue is what will be the position of the maratha elites? In the last four years, the maratha elite has been living a life of dual reality. On the one hand, they have lost state power and are begging for minor positions of power from the alliance. On the other hand, they still continue to hold considerable power at the local level in terms of control over co-operative networks and local government bodies. However, these power centres are subject to control from the state government. The maratha elites in the last four years did not hesitate to buy peace from the alliance and retain power either by joining one of the alliance partners or by operating as 'independents'.

In the past, Shiv Sena has been critical of the marathas for monopolising the positions of power. The BJP too was not known for being close to the maratha community. But since the 1980s both parties have realised that electoral politics in the state leaves them with very few options. Since both are not interested in constructing social alliances on a radical basis, they had to turn to the maratha community. This involved a betrayal of their considerable OBC following. This betrayal need not surprise us because both the parties looked upon – and continue to look upon – the OBCs as mere cannon fodder. The real surprise, however, was the response of the maratha elite. Large sections of the maratha elite did not appreciate the policies initiated by Sharad Pawar. They had very myopic notions of distribution of resources. Their discomfort at the pro-urban policies of the Pawar government landed them in the laps of the alliance which was closer to and organically related to the urban interests. Secondly, sections of maratha elite were opposed to even cosmetic measures directed at social justice. This opposition dates back to the issue of renaming of the Marathwada university after Dr Ambedkar. Disregarding their opposition, renaming was done in 1992. The state government also introduced reservations for OBCs in the local bodies, thus partially undermining the power of the maratha elite at the local level. In this background, the maratha elite distanced themselves from the Congress in 1995 and contributed to the defeat of the party. Once the party was out of power, some of them started discovering the virtues of Shiv Sena. We need also to keep in mind the fact that being high up in the caste hierarchy and having claimed the kshatriya status, marathas are favourably inclined to the Hinduist appeal. The peculiar situation of the state makes it difficult for the marathas to join the RSS-led BJP. In Maharashtra, the marathas have had a history of adversarial relation with the brahmins. They have in fact led the non-brahmin movement in the first half of this century. In view of this, direct entry into the BJP is a difficult proposition. Nonetheless, the appeal of hindutva led many a maratha elite to the doors of Shiv Sena.[2] But after all, Shiv Sena is a family enterprise. Therefore there are limits to what Shiv Sena can offer these maratha elites. But the behaviour of the pro-Sena elite among the marathas suggests that they will be ready to compromise their and the community's interests for small gains. This is for three reasons. Firstly, most maratha leaders understand power only in terms of access to state resources. This understanding means that electoral defeat is an end to the political power of the person concerned. Hence, one has to remain in the vicinity of state power by whatever means. Secondly, management of the co-operatives is in a very bad shape and many of them cannot survive without the support of state government. Worse, the co-operative network is today almost devoid of popular base. This situation compels the leaders of the co-operatives to try and remain in the good books of the government. Thirdly, the maratha elite is interested in keeping the OBCs away as far as possible. If they support the Sena, that might result into less tickets for the OBCs. The foregoing discussion does not suggest that the entire maratha community shares this short-sighted approach. However, electoral mobilisation allows greater role for these community elites than their actual worth. At local levels these leaders can considerably transfer votes from one party to another.

Congress Rejuvenation

This is where the Congress comes into the picture. The Lok Sabha elections of 1998 have shown that the party still continues to have both popular base and a network of local leaders who can mobilise votes. Encouraged by the results of the last Lok Sabha elections, a number of rebel MLAs have been seriously thinking of joining the Congress. However, there seems to be two constraints in this respect. Firstly, the present Congress leadership is less than enthusiastic about the return of the rebel MLAs. This is not merely because their return will complicate the issue of ticket distribution in next assembly election. The Pradesh Congress seems to be believing that with Sonia Gandhi at the helm, the voter will be naturally attracted to the Congress and therefore, the entry of rebel Congressmen is of no consequence. Secondly, the installation of a new chief minister has forced the rebel MLAs think twice about their plans. Twenty-six of the 44 'independent' MLAs gave a written statement to the governor pledging support to the new chief minister. One reason for this new-found love is the fact that the new chief minister is a maratha by caste. This response by the independent MLAs poses a problem before the Congress. For long, the party was seen as the representative of maratha interests. Having lost the confidence of that community, should it try and regain support from marathas or should it go in favour of a maratha-OBC combination? This brings back the Sonia factor. It will be difficult for the party to win elections exclusively on the basis of the magic of Sonia Gandhi.

What Does Congress Stand For?

The party will require a four-fold strategy to electorally confront the BJP-Shiv Sena alliance. This will consist of a popular national leader, competent state level leadership, network of local workers, and a durable popular vote base. A towering and popular national leadership will indeed be very necessary for attracting voters. A large number of voters would definitely be swayed by identifying with a leader who they believe is above party factions and sectional interests. But such national leadership can click only when the state level leadership is active in mobilising the people. In Maharashtra the Congress has been less than successful in this respect. Sharad Pawar is the only leader at the state level but many sections within Maharashtra Congress would rather see the Congress be defeated than accept his pre-eminence. On his part, Pawar has been repeatedly *unsuccessful in making himself acceptable to rival factions. Pawar has failed on two* other counts also. He has not been able *to mobilise agitations against the ruling alliance in last four years. Although he had* publicly promised that Congress would not topple the present government, that should not mean that the Congress would abdicate its responsibility as opposition party. The experience of last four years has shown that having failed as a ruling party, the Congress has lost as an opposition party as well. As a result, in the face of elections, Congress has merely to fall back upon its traditional support base. Pawar landed in this predicament because of his uncritical and blind shift to the policies of liberalisation. He might have thought that by adopting these policies, he would win over the capitalists in his bid for national leadership. But such a stand also involved estrangement from the mass of poor voters with disastrous electoral consequences. At the present juncture, Congress in Maharashtra will have to focus more on the questions of rural poverty and unemployment. This requires a modification of the party's stand on the economic issues on the one hand and sincere efforts to integrate the OBC interests in the party on the other. This state level exercise alone can translate the Sonia magic into votes.

Such an exercise will also require a network of vote-mobilisers. It is not sufficient to have only well-intentioned policies or a commanding leadership. Our electoral context makes it necessary to have 'middlemen' – the linkages between party and the voters.[3] This peculiarity stems from the fact that the electorate is composed of many cross-cutting interests and social segments. Besides, the 'language' of parties and politicians often needs to be deciphered and communicated to different sections. This can be done only by the local activists of the party. The defeat of the Congress in 1995 was partly due to the refusal of such linkpersons to oblige the Congress. Unfortunately, this aspect of elections has not been adequately emphasised. During the last four years, many local Congress workers, who were not accustomed to functioning as opposition workers and whom the state leadership did not bother to steer into meaningful action, have aligned with the ruling coalition. For most of the local Congress workers it is hard to intelligently explain to the voter what does the Congress stand for. They are too much hooked to the local power structures and entrenched interests. This alignment implies that they find nothing wrong in disregarding the party in favour of local considerations.

Finally, what kind of popular base does the Congress project for itself? In terms of caste, we have noted above that *the traditional maratha following of the Congress has become vulnerable to appeals* from the Shiv Sena and the BJP. Some sections of the maratha community are not prepared to accommodate the dalits or the OBCs. In fact, this predicament has landed the Congress in the present situation. At the same time, the maratha community cannot be entirely bypassed either. The task before the Congress leadership would be to disintegrate the mythical maratha vote and to seek to build new alliance of the poor maratha with other non-maratha castes including the dalits. The split in the maratha leadership and the maratha vote in 1995 offers the Congress such an opportunity. This will virtually mean writing a fresh text for the future politics of the state. At the moment, no Congress leader seems to have any interest or inclination to undertake anything resembling this. It is more likely that the party will content itself with tokenism and clever electoral manipulations expecting quick gains. The Congress has also been unable to extend its base beyond the rural constituency. In a rapidly urbanising state, this limitation might prove very significant. Although the ruling alliance is unpopular in urban areas, the Congress does not have the network of activists for effectively organising this dissatisfaction.

Third Force

The foregoing discussion revolves around the Congress because in the present circumstances there is very little space for the third alternative in the politics of the state. In the last assembly elections, although the Congress was defeated, the performance of the third alternative parties was dismal. The Janata Dal has never been a relevant force in state politics. The communists too have only a few pockets. The Peasants' and Workers' Party (PWP) is fast becoming a relic of the past. It has some base left in four or five assembly constituencies. This leaves the Republican Party of India (RPI), which is always fraught with unending factionalism. The RPI has following in most constituencies but that is inadequate to ensure victory of its candidate in any single constituency In the 1995 election, Janata Dal won 11 seats, PWP won six and CPI(M) three seats. The Samajwadi Party, a new entrant to state politics, won three seats. In the last Lok Sabha elections, the Congress had an alliance with the RPI and the Samajwadi Party. The RPI contested four seats and won all the four seats. Incidentally, all

these four seats were unreserved constituencies. After the elections, internal factionalism erupted in the RPI and the Ambedkar faction and the Athavale faction held separate conventions. For all practical purposes, today the party is split into two. Prakash Ambedkar, leader of one faction, has long been arguing for a third alternative. Even after the successful alliance with Congress for parliamentary election, he has relentlessly argued for a third force. However, he is handicapped by the fact that there is no third force in the state. In the assembly elections slated for next year, supporters of third alternative have little scope for manoeuvre. The JD and the PWP do not count. Therefore, third force can come about only through the alliance of RPI and Samajwadi Party. Experience of 1995 assembly election shows that such a configuration can only lead to strategic advantage to the BJP and Shiv Sena. Thus, the third force argument faces a double dilemma. National politics suggests the futility of pinning all hopes on the Congress. But at the state level, the anti-Congress space is presently occupied by the BJP and Shiv Sena. Therefore, how is one to pursue third force politics without indirectly helping the BJP? The dilemma is more complex when one considers the electoral options in the state. If the so-called third force joins the Congress, it fears amalgamation at state level and subsequent weakening of third force agenda at the national level. On the other hand, the very existence of the third force in state elections may cause the victory of the present ruling combine. Thus, state politics does not leave room for the independent existence of third force. In other words, the terms of political exchange cannot be defined by the third force parties. It must be squarely faced that this situation does not arise only from the compulsions of electoral politics. The third force parties in fact, relish the situation of electoral uncertainty. They are mostly not interested in building a long-term strategy. This is evident from the cavalier fashion in which the question of alliance with Congress was handled in after the Lok Sabha election. The RPI got and won four seats. This advantage was squandered without concentrating on party building and broadening the social base of the party. It has now become almost tiresome to repeat that the RPI must go out to non-mahar as well as non-dalit sections and that it must develop durable organisational structures. Instead, there has been constant attempts to monopolise the same small but somewhat strategic support base. The competition between Ambedkar and Athavale is for this very limited base. Neither has seriously attempted large-scale mobilisation with a specific agenda. Come election and they will flex their muscles for a greater share from a beleaguered Congress. This might win some seats but cannot expand politics of the third force.

Unpopular Plunderers

The foregoing discussion is grounded on the assumption that the present ruling alliance has not endeared itself to the electorate during the last four years. People in the state have in fact been faced with an alliance of plunderers. Recently, a cash strapped Maharashtra government has been spending huge sums to advertise its so-called achievements. One wonders if anyone will take these advertisements seriously. Fiscal mismanagement coupled with corruption and non-feasible populism has meant that the state is on the brink of bankruptcy. Moreover, the ruling combine has become extremely unpopular among different sections of the society. The Shiv Sena and BJP seem to be committing the same mistake which Sharad Pawar's Congress committed: ignoring their urban base, the ruling alliance is now targeting the rural vote. This means that they will be losing the urban vote without necessarily winning popularity among the rural populace. The desperation is so widespread that at the recently concluded 'mahashibir' (mega-conference) of Shiv Sena at Nasik, Thackeray appealed the people not to vote the Congress even if they did not want to vote the Sena! The strategies of the Sena and the BJP, like those of the Congress earlier, are ad hoc, manipulative and lacking a clear direction. On the one hand, the government is going fast on the super highways project, while allowing the alienation of large sections of white collar middle class employees. The much advertised Krishna valley project has run into difficulties while alliance partners are engaged in competitive populism on the issues of free supply of electricity to farmers and the prices of cotton. In the social sphere, too, the alliance has carefully avoided face off with the Muslim community but landed in trouble over VHP's anti-Christian campaign. The BJP has constantly tried to distance itself from Sena in the case of corruption charges hoping that this will ensure the support of urban voters. The last four years have witnessed constant bickering between the Shiv Sena and the BJP on the one hand and tension between Thackeray and the earlier chief minister, Manohar Joshi. The political scene was further complicated by the factionalism within Shiv Sena. For some time now, efforts are going on to form a party of disgruntled Sena followers. Should that happen, the prospects of Sena in the Marathwada and Vidarbha regions will take a further dip. The BJP hopes to gain from the failure of its partner. On its own strength, the BJP cannot boast to win many seats. It expects to keep in tact its urban middle class votes and receive the support of disenchanted Sena followers. The tragedy for the state is that the Congress is not sincerely interested in fighting the plunderers and the self-proclaimed third force lacks both the vision and the strength to initiate public agitations. Given this scenario, the state may witness electoral reverses but there is reason to fear that the political process may not really change for the better.

Notes

1 For details of voter preferences in the 1995 elections, see Suhas Palshikar, 'Capturing the Moment of Realignment', *EPW*, January 13-20, 1996; pp 174-178. The Congress has not been able to bring back all sections of the maratha community during the last four years. As a result, many 'independent' maratha MLAs continue to support the alliance.

2 Vora, Rajendra and Suhas Palshikar, *Maharashtratil Sattantar* (Marathi), 1996, Granthali, Mumbai, pp 124-127.

3 Often election results are understood in terms of percentage of votes, and in answering the question why did voters choose a party, recourse is taken to voter preferences. This may not throw adequate light on how were voters mobilised. Vora has argued that factionalism matters in elections because factional leaders are important links between voters and parties. See Vora, Rajendra, *Rajyat Congress Ka Harali?* (Marathi, Why Was the Congress Defeated in the State?), *Loksatta*, May 19, 1996. I feel that this is an important argument which needs to be elaborated and tested as an aid to voter surveys.

Threats to Syncretic Culture
Baba Budan Giri Incident

Muzaffar Assadi

Karnataka's long syncretic tradition is increasingly coming under attack from elements of the hindutva forces. The Baba Budan Giri incident last December is an illustration of this new focus.

A small hill station known for syncretic culture, Baba Budan Giri in the picturesque Chickmagalur district had suddenly become the focus of new hindutva forces. The VHP and Bajrang Dal declared that on December 3 they would be 'liberating' Datta Peeta/Dada Peer dargah from the clutches of Muslims. Towards this end, they resorted to the strategy of taking out rath yatras, paralleling Advani's strategy during the Ayodhya issue, from five different places, converging in Chickmagalur one day prior to the Datta Jayanti on December 3. The first rath yatra was flagged off on November 20 from Chickmagalur covering all the mandal panchayats; the second began from Narasobanwadi in Raibagh taluk of Belgaum on November 25 covering Belgaum, Uttar Kannada, Mangalore and Shimoga. The third rath yatra started from Gangapura in Gulbarga district on November 27 and passed through the districts of Gulbarga, Bijapur, Bagalkot, Dharwad, Hubli, Davanagere and Shimoga; the fourth began from Huragadde in Raichur covering Bellary and the last was flagged off from Melkote on December 1 passing through Hassan and Mandya. In addition, new hindutva forces, among them the Bajrang Dal being the most vocal, threatened to send suicide squads or to take a confrontational path if things were not 'righted' within a year, meaning two things: offering pooja every day and replacing the present custodian who is a Muslim. Nonetheless, despite the provocative speeches, the convergence of more than 10,000 people, and the hoisting of a flag atop the Baba Budan Giri hills, the Dattaraya festival went off peacefullly. The state government handled the situation very firmly. Nonetheless, it brought to the centre-stage a number of issues as to what would be the consequences of Baba Budan Giri incident on the historic syncretic culture prevailing in Karnataka? What was the main agenda of the new hindutva forces? Who would be the immediate targets? Why is that Bajrang Dal interested in this issue more than the BJP? Why was Baba Budan Giri selected than any other place in Karnataka in particular, south India in general.

Baba Budan Giri represents an unique syncretic culture of Hindus and Muslims where both offer prayers in a cave-like structure. It derived its name from a Muslim Sufi saint who was in turn the disciple of another Sufi saint called Hazrath Dada Hayath Meer Khalandar. Dada was one of the earliest to arrive in India (1005 AD) from west Asia to preach Sufism in India. When he came to south India, he selected the present cave for his meditation. In fact, the Puranic name of the hills was Chandra Dona, as it look like a crescent or a horse shoe. The place Dada selected was equally believed to be the seat of Dattaraya Swamy, who is said to be the last avatar of Vishnu; he is believed to have vanished from one of the caves to Kashi to be reincarnated in future. Another belief is that Dada Khalandar and Dattaraya Swamy are one and the same person. The story goes that after clearing the area Dada decided to settle down for meditation. "He needed water to perform 'wazu' for his prayers. He was a stranger in this area and did not know where water was available. He prayed and started digging the ground in front of the place he had selected as his seat of meditation and found a perennial spring. He thanked god and spent the night in prayers and meditation. Early in the next morning a brahmin and a jangama entered the cave, as per their custom, for worship. Seeing Dada absorbed in meditation they thought that he was the incarnation of Sri Dattaraya Swamy" (Sajjade Nishin, *Hazrat Dada Hayat Meer Khalandar*, 1979:10). Likewise the Hindus, Muslims also believe that Dada had disappeared from one of the caves to Mecca and Madina and is alive and will in due course appear before the disciples. After him, Baba Budan, one of his closest disciples who introduced coffee to this hilly region, brought from Mocha in the west Asia, carried his mission further. Baba Budan, whose history is usually traced to Bagdhad, reached Chickmagalur via Malabar and Mangalore. Baba Budan was killed in an ambush near the present cave and was burried along with two other Sufis inside the cave. Interestingly, he is also called Hazrath Syed Meran Baba and also Jan-e-Pak Shaheed. The institution of custodian of the site although it is traced to Dada, began to centralise in a single family after the death of another Sufi saint, Hazrat Syed Shah Jamaluddin. "For reasons not known Jamaluddin also became famous as Baba Budan during his life time" (Ibid, p 43). The custodian of the site/shrine is called Sajjade Nishin. There are a few characteristics attached to him: "only Sayyads can become swami, either Husseins or Khadris, the descendents of Hussen or Hassan, sons of Ali. After initiation, a Khadri becomes Shah Khadri, and after apostolic seat, he is styled Sajjade. No unmarried man can become Sajjade" (*Mysore Gazetteer*, 1927:1137). Now this particular institution has come under threat.

In Datta Peeta/Dada Peer dargah the syncretic culture comes to light in many ways. The date of the Urs is decided on the basis of the Hindu calendar; musical instruments like 'kombu' and 'kahale' are part of the Urs, Muslims and Hindus pray to both the 'padukas' kept in the cave supposed to be of Dattaraya and Dada Peer; Sajjade Nishin, the present custodian is called 'swamy' and also 'Sri Dattaraya Swami Baba Budan Swami Jagadguru', worship of the peeta or the seat is exclusively the privilege of an unmarried man or fakir; Hindu symbols like breaking the coconut in front of the gate is a common practice; collecting the sandal or soil is not uncommon; and the Hindu tradition of lighting the lamp is also practised and finally Hindus and Muslims celebrate Datta Jayanti and Urs every year in the same place.

A large number of stories have been constructed around Dada's dargah. These stories pertain to the spiritual and healing powers including the power to bestow children, relief to physical disorders, property disputes, etc. This is one of the reasons why the site has become famous. There are stories about how Dada protected a princess who later on came to be known as Sathi Samyukta by Hindus and Mama Jigni by the Muslims. Most important is the story about how the princely state of Mysore was bestowed with an heir to the throne by Dada, and how the maharaja would be able to break the stone laid before the cave. This is a typical story which has similarities with the stories surrounding the birth of Jahangir (with the blessings of Sufi saint Nazrath Shah Sali) and Tippu Sultan (with the blessings of

Tippu Aulia of Arcot). This story is important for two obvious reasons: It provided legitimacy to the claims of spiritual power of the Sufi saints, secondly, it made the state liberal, moderate and secular:

> Sri Krishna Raja Wadiyar had no son in his family for a long time. He was worried much about it. Once, coming out of the dargah, he saw the stone slab where devotees broke the offered coconuts. Struck with an idea, he made a vow quietly that he would split that stone with coconuts on the birth of a son in the family. Soon after that his brother had a son, Sri Jaya Chamaraja Wadiyar. He came to the dargah with cart-loads of coconuts to fulfil his vow and began breaking coconuts one by one. The stone remained solid even after many cart-loads were finished. He was in a dilemma. He had to fulfil his vow but it appeared impossible. At long last he realised that in his anxiety he made a vow which was apparently impossible. He explained the situation and requested Hazrath Peer to take him to Dada and pray for his pardon and suggest a solution. After Hazrath Peer recited the Fateha, Maharaja expressed his gratitude to Dada, repented his folly, sought out of the dargah and following the instructions, he broke the coconut on the stone slab. To his pleasant surprise the stone developed a crack (Sajjade Nishin:29).

Support to temples, mosques or to the shrines were not uncommon in Karnataka. Karnataka had the tradition of tolerant state system both under princely rule and under the Muslim rulers like Tippu Sultan and Hyderali, even though the latter two have become the victims of colonialist historiography. Colonialist historiography often projected them as 'cruel' (Nanjundayya, *The Mysore Tribes and Caste*, Mysore, 1931:281) and 'intolerant' who made the "cause of Islam a pretext for the most terrible persecution of degradation with a wowed object of extinguishing every other form of belief" (Lewis Rice, *Mysore Gazetteer*, 1931:479-80). This project had the larger design of negating the significant contributions that these rulers made towards building a secular/tolerant society. There are many instances where both had supported temples, mathas, which however are ignored. Tippu helped the monastery of Srinigeri, one of the mathas or monasteries was established by Shankaracharya after it was plundered by maratha horsemen; he provided financial help to the same monastery for the purpose of Shata Chandi Japa and Sahastra Chandi Japa ceremonies; he gave land and cash awards to Lakshmikant and Nanjundeshwara temples in Kalala village in Nanjangud taluk; gave financial assistance to Srikanteshwara temple in Nanjangud and Narayanaswami temple at Melkote, Ranganatha temple at Srirangapatna, Anjaneyaswami temple at Ganjikota, etc. His patronage also includes temples in Trichur (Vadakkunathan), Vailattur (Tiruvachikulam), Guruvayoor (Guruvayoor), Tikkandiyur (Tikkandiyur Samooham temple), etc (C Rajeswara Rao and Hasan Abdullah, *Tippu Sultan Facts and Fiction*, 1990:14). It is in this situation or context of contesting the history or erasing the memories of history that new hindutva forces and the colonialist historiography come close. This is not limited only to Muslim rulers but even to the Sufi saints In the case of Dada Peer dargah/ Datta peeta the colonialist historiography made three observations: that it was 'occupied' by a 'Musulman' Sufi saint; that it was a placs of Hindu 'worship' and finally that Dattaraya Swami and Dada Peer were one and the same. New hindutva forces have picked up similar arguments adding new issues: "This place was once a place where great sages had performed meditation and now the same has turned into a place were cow slaughter is practised". "This place has to be made part of Hindu community. If Bharat Mathe is not worshiped in India where else would it be possible? Is singing Saraswathi Vandana wrong? (*Deccan Herald*, November 21, 1998). It is in this context that the issue has to be analysed from the larger perspective.

In fact, this particular issue has to be seen against the backdrop of crises that the new hindutva forces, including its political outfit BJP, are facing subsequent to the demolition of Babri mosque and the coalition politics that the BJP entered into. Earlier to demolition, the Babri mosque issue or debate provided hindutva forces a strong case to defend and expand its bases. The socio-political agenda of capturing power was partly realised when its outfit BJP came to power at the centre and other parts of India, however with the help of coalition politics. The demolition although, helped the BJP in the immediate context of capturing power, but itself created a vacuum leading to internal crises. This is the reason why hindutva forces including BJP have not been able to take up or raise the Mathura Krishna Janmabhoomi issue or the issue of Kashi Vishwanath. Here lies the identity crises too – neither was it interested in loosing its identity as the conscious bearer of Hinduism nor going into history as a spent force. In addition the election results in three important states – Madhya Pradesh, Rajasthan and Delhi – further added to its problem. North India is becoming vulnerable to hindutva politics. This is the reason why hindutva is now looking for an issue, mainly in south India. Baba Budan Giri came in handy to bridge north and south India within the larger framework of hindutva. Since Chickmagalur is known throughout India (Indira Gandhi contested the Lok Sabha election and won in the 1970s), hindutva forces had no trouble projecting the place at the all-India level. In addition, Karnataka was even as fertile ground for realising or reclaiming of overcoming the crises and therby consolidating its bases. The recent victory in the Lok Sabha election has been treated as a legitimate consent to its activity, and also that it reflects the prevailing strong bases of the new hindutva. Nonetheless, one cannot negate the effect of political uncertainty prevailing in Karnataka. Here it is trying to appropriate the uncertainty in the event of election. It is in this context that Baba Budan Giri was suddenly brought to centre stage.

Syncretic culture would be the first victim of new hindutva forces. There are a large number of dargahs and peetas venerated equally by Hindus and Muslims in Karnataka. In Bidar, Bande Nawaz, in Davangere Gulam Shah Vali, Mulang Shah Vali, in Mangalore Syed Madani, in Shimoga Darvesh Shah Vali are some of the dargahas. In fact, every district, hobli or taluk has at least one dargah or peeta which has bridged the gap between the communities. There are temples too which are also venerated by Muslims. In Mulki, nearing Mangalore, Bappa Nadu temple, Shishunala Sharifa temple in Dharwad district, Ilaval Shakti temple in Mysore, Yellamma temple in Dharwad are some of the temples which were either constructed by Muslims or been revered by them. In these places syncretic culture is expressed in many ways: In Holeyal in Dharwad district the 'gaddige' or the seat is constructed in such a way that half of it is in Muslim style and another half is in Hindu style. In Mulki, the car festival has to begin with the consent of Bappa Bairy family. In Kateel Durga Parameshwari temple in Mangalore district, every year Muslims have to perform a popular folk drama or 'aata'. In Anandpur in Shimoga the temple and mosque have a common wall. In these places it is obvious that symbols of the two communities have no separate meanings. Lighting the lamps, breaking the coconuts, offering arathis, wearing the beads, etc, are not the monopoly of any particular community. They never became the contesting issues either in Baba Budan Giri or elsewhere in Karnataka. These are the places that prevented the frequent occurrences of com-

munal riots in Karnataka. During the colonial period there was only one big communal riot time in the 1920s, on the issue of Ganesh festival. During the post-colonial period uptil the late 1980s the number swelled to 30 which was a small number compared to other parts of India: Belgaum, Hospet, Bagalkot (1957), Gulbarga (1964), Mangalore (1967), Chickmagalur and Munireddy Palya (1968), Hubli, Belgaum, Gulbarga and Bantwal (1978), Kolar and Bijapur (1979), Hassan, Kollegal and Sira (1980), Shimoga (1981), Robetsonpet (1982), Davangere (1984), Shivaji Nagar Bangalore (1984), Bangalore, Mysore, Shimoga and Bidar (1987), finally Sidlagatta and Kolar (1988). These are the places known for acute contradictions between Hindus and Muslims on such issues as capturing the economy, larger market and the labour power. Nonetheless, what changed the course of syncretic culture or communal harmony is the Babri mosque-Ayodhya issue. This has had two consequences: one, increasing ghettoisation or realignment of houses or dwellings to their respective community areas; two, perpetual communal tensions in many places and the notion of 'perpetual abstract threat' in the localities. Once again the syncretic culture is under threat.

The poor and the marginal sections are particularly threatened. The people who visit dargahs or peetas are belong to these groups; they have seen in these dargahs/peetas a place offering solace. More than that they have become cultural and identity symbols for these people, especially in the way sufis/saints lived in simplicity and perfect harmony. Suddenly they are confronted with the idea that these symbols of life are collapsing or becoming the contentious issues. It is here that a new crisis is emerging at the grass roots level – crisis of culture, identity and the self. This is a dangerous trend that the issue has unleashed.

Why is the Bajrang Dal more interested in fomenting the communal cleavages on this particular issue? This can be seen in terms of the social bases and the immediate agenda of BJP and Bajrang Dal. The social bases of the latter can be located among the unemployed, semi-literates, semi-urban and largely with the lumpen. BJP's bases are located in urban areas, merchant/capitalist class, middle class and the educated. The Bajrang Dal had the immediate agenda that once the communal passions are aroused in the vicinity of the coffee economy, it would have the consequences for coffee planters and labourers. The latter would be forced to vacate the estates, especially those who have come from Tamil Nadu and from other districts of Karnataka. This would be filled up by the locals. However, in the Malnad region most of the money to the BJP's party funds comes from the coffee economy which is why in the last Lok Sabha election BJP won two seats in the Malnad region. This is why in the immediate context the BJP down played with the issue, although in the larger context it supports the new hindutva forces. In this clash of interest will Karnataka's syncretic culture be preserved?

Crime without Punishment

Frederic F Clairmont

Sir William Macpherson's official inquiry of the killing of a Black student by fascist thugs unequivocally brands the police and by extension the justice system as 'institutionally racist' and presents many policy recommendations. Will this report make for a change?

> Skin colour is a permanent and involuntary uniform which performs...the functions of a uniform in warfare, distinguishing one side from the other, friend and foe, making it possible to see at a glance where to render assistance and where to attack.
>
> – Enoch Powell.[1]

BENIGN myths and counter-myths have always sedulously shrouded the overpowering and historical reality of the mendacity, corruption, violence and endless cover-ups perpetrated against the British working class, and of more recent vintage, its ethnic minorities, by one of the UK's paramount ruling class institutions: the 1,25,000 police force. That in the most bourgeois of nations whose media barons, and their political hustlers, unceasingly babble about human rights and, in the current foreign secretary's lingo, the ethical dimensions of British foreign and domestic policies.

The crime of Stephen Lawrence, a British born 18-year old Black student, was the fulfilment of the testament of Brigadier Enoch Powell, a leading ideological engineer of British toryism. He was stabbed to death when waiting for a bus in the suburb of Eitham by five fascist thugs. With his "permanent and involuntary uniform" his assassins knew "where to attack". He was left bleeding to death, unattended. Even in death, however, there would be no peace. His granite tombstone was smashed by racists less than 24 hours after the publication of the official inquiry.

It was not the end of this despicable event. It turned out that the surveillance camera, ostensibly monitoring the site, was a police fake. Indeed, the close circuit television camera was removed even though the metropolitan police were forewarned that his tomb would be targeted by fascists. This was the ordeal of the triple coup; after this desecration his Jamaican parents dispatched his body to Jamaica for its final resting place. "It is just as well", one Black woman noted, "for, these people will never let him rest in peace". Once again another racial murder served as a grim reminder of the gathering speed of racism in Europe and in the US.

Racism is not confined to the police force but ramifies into all public services, strikingly so in the foreign office and the armed forces. It infiltrates every cranny of British society. The rapacity of racism has been speeded up with Thatcher's demolition of the Welfare State under and perpetuated by Blair's model of the 'enterprise culture'. Without market freedom intones Milton Friedman liberalism and its entire works. The social and racial reverberations are all too apparent. The two nation thesis that Benjamin Disraeli (1804-1881) formulated in the middle of the last century has not lost its potency.

The UK no less so than the US is a society ripped apart by race and the inequities of class domination; a social order in which the rich are getting richer and the poor getting poorer, or at best clinging to their precarious existence. Around a quarter of the Black and Asian population hover near or below the poverty line. Rabid discrimination and segregation in education, employment, housing, social services linked to untrammelled market forces have massively marginalised ethnic minorities in both the US and the UK.

The market, so goes the fatuous rhetoric, is the great equaliser for all members of society: Black and White, young and old, males and females. The market must be the deciding benchmark of human welfare: the one and only. The propaganda model and the reality however are widely asymmetrical. The gap between the earnings of the top of the capitalist income pyramid and the others is widening, alarmingly and not only in the UK. It is arduous to estimate the actual returns

of the corporate caste executives because their financial remuneration (in most cases concealed by complex accounting stratagems and disbursed in offshore bank accounts) contain all sorts of complex variable payments. A top executive in the UK by standard accounting procedures earns between 20-25 times the earnings of a junior clerk.[2] By the magic of creative accountancy the disparity is much bigger.

Sir William Macpherson's official inquiry tersely entitled: *The Stephen Lawrence Inquiry* (Her Majesty's Printing Office, London, February 1999) is one of the most formidable landmarks in British social history of the 20th century. It unequivocally brands the police and by extension the justice system as 'institutionally racist'. The case is argued with a sustained and unrelenting passion, a rare bird in the annals of official British documents. After more than 70 days of hearings and more than a 100 witnesses and over 100 pages of testimony two major themes emerged: pervasive institutional racism in the metropolitan police and the crass injustice of a judiciary justice that allowed his five killers to be freed. The damning specifics of the inquiry presented in its 70 policy recommendations is a superb achievement in its uncompromising moral rectitude. But will it suffice to half racism that has scaled such momentous heights, and which exhibits no signs of deceleration?

Indeed, why should Sir William's report succeed when the Scarman Inquiry (1981) born of the Brixton and Toxeth racial uprisings miserably failed? Why has the Race Relations Act which has long existed, with all its fancy legal paraphernalia, remain nothing more than a disingenuous legal artefact? The brute facts of British racism – and hypocrisy – are stunning evidence of official double talk and barefaced deception. According to official data, Black and Asian citizens are five times more susceptible to be halted and searched than others. Unofficial questioning is even more grotesquely disproportionate. Likewise racist crime is blatantly under-reported. This is a policing system that puts a premium on what the British and their US police counterparts label 'racial profiling'. Numbers by the Home Office for 1996-97, pinpoint an absurdly exiguous 13,151 racial attacks, whereas according to the British Crime Survey more than 10 times such racial attacks occurred.

Note the grim similarity on the other side of the Atlantic. "To be a Black driver in America is to invite police scrutiny, as thousands are daily singled for groundless pull-overs, 'pretext' stops, and subjected to intrusive, warrantless searches and abusive treatment by the police" (*Counter Punch*, Washington, DC, March 1-15, 1999). Nothing could be more poignantly descriptive of the hatred and callousness of the police towards coloured peoples than the reaction of the detective chief superintendent responsible for investigating Lawrence's murder. When Doreen Lawrence presented him the list of suspects he grabbed it, according to her testimony, "and rolled it up to a ball in his hand".

Coinciding in time with the appearance of the Stephen Lawrence Inquiry was the racist master plan for Africa blueprinted by Marshal Bernard Montgomery written in 1947 and released by the Public Records Office. It was his grand imperial plan to turn the continent into a white supremacist rampart against communism one of his dominant obsessions until his death. Montgomery, a close friend of Brigadier Enoch Powell, tells us that "the African is completely savage and is quite unable to develop the country himself". Among his many gems was that "we should have no nonsense with the United Nations about Tanganyika; it should be absorbed into the British bosom (*Reuters*, January 8, 1999). Had he forgotten that this 'completely savage' species had fought in almost all major theatres of war: south-east Asia, the west Asia, East and North Africa and Italy?

The fascist execution of Lawrence bears striking similarities with the findings of the official report of the Lyndon Johnson administration entitled: *The National Advisory Commission on Civil Disorders* published in the wake of the racial uprisings in Newark and Detroit in 1967. Its findings have not been tarnished by time nor has it lost its relevance to race and class divided Britain stumbling into the next century. "Our nation is moving towards two societies: one black, one white – separate and unequal. Segregation and poverty have created in the racial ghetto a destructive environment totally unknown to most white Americans. What white Americans have never fully understood – but what the Negro can never forget – is that White society is deeply involved in the ghetto. White institutions created it, white institutions maintain it, and White society condones it (Summary, March 1 1968, Government Printing Office).

Lawrence's execution will no doubt be a catalyst in British race relations for there are now tens of thousands of coloured activists, joined to others, to whom racism is one of the vilest of crimes, incompatible with democratic values, and who are bent on changing the vileness of the present order. There are of course those, like Doreen Lawrence, however, to whom unremitting repression and assassination of coloured peoples will continue to remain an immutable fact of life. "My feelings about the future", she lugubriously notes, "remain the same as when my son was murdered. I believe Black youngsters will never be safe in the streets" (*Financial Times*, February 25, 1999). On that score, however, the ultimate solution goes well beyond the compassionate recommendations of the Macpherson Inquiry.

Notes

1 *Time*, February 7, 1977. This had in mind no doubt is what David Lloyd George had in mind when he said in the thirties that 'when you scratch a Tory you'll always find a fascist'. Quoted in R P Dutt, *Fascism and the Social Revolution*, Golianz, London 1934.

India-Sri Lanka Free Trade Accord

K N Harilal
K J Joseph

Preferential trade arrangements, as have come into force under the India-Sri Lanka free trade agreement, have varying impact on sectors as well as regions in the two countries. Preparatory studies and careful planning are necessary in order to provide safeguards and to minimise adjustment costs.

THE contradiction between multilateralism, the principle around which the post-war trading system is supposed to be built up, and regionalism notwithstanding, the preferential trading arrangements are here to stay and grow. The success of the European arrangement seems to have proved to be too tempting for others to desist the urge for emulation. The last two decades witnessed the formation of nearly two dozen trading blocs in different parts of the world. Their survival and success rates, admittedly, have not been very impressive. But, the trend is there for everybody to see: The share of intra-bloc trade in world trade has been growing all these years almost consistently at the expense of 'most favoured nation' (MFN) trade. Not to be left out of the race, South Asian Association for Regional Co-operation (SAARC) countries also came up with a proposal for establishing a preferential trading bloc in the region, viz, the South Asian Free Trade Area (SAFTA). But, right from the beginning, it was clear that SAFTA would remain a statement of intention than reality for long. The political conflicts that distance the countries of south Asia are too complex to be resolved in the framework of SAARC in the near future. It may be this limitation of the regional arrangement that prompted the governments of India and Sri Lanka to experiment the bilateral route to achieve the goal of freer trade between the two countries. It is quite possible that the India-Sri Lankan free trade agreement would prompt similar bilateral agreements among SAARC countries and ultimately pave the way for the SAFTA.

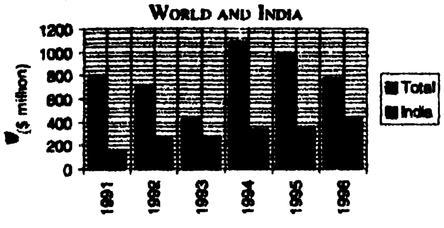
The long-term outcome of the India-Sri Lanka accord signed on December 28, 1998 by the prime minister of India and the Sri Lankan president would be nothing short of establishing a free trade area between the two countries. Both the parties have agreed to a time frame for phasing out the trade barriers affecting their mutual trade. India would remove customs duties on nearly 1000 items of imports from Sri Lanka before March 1, 1999, the day the new accord is scheduled to come to force. Within a period of three years trade barriers pertaining to other tariff lines would be phased out. On their part, the Sri Lankans would remove import duties on around 300 items before the deadline of March 1, 1999. Sri Lanka would be given a period of eight years for phasing out the barriers affecting the rest of the tariff lines.

Interestingly, in addition to their mutual commitment, there would be international pressure, especially from the World Trade Organisation (WTO), on India and Sri Lanka to stick to the time schedule and complete the process of establishing the free trade area without undue delay. It is true that in spite of its commitment to uphold the 'Most Favoured Nation' clause, the WTO treaty (Article XXIV of GATT 1994) provides for the formation of preferential trading arrangements (PTA). But, the sanction for preferential trading arrangement is subject to the condition that the PTA members remove all barriers to intra-bloc trade within a definite period of time. The WTO rules permit discriminatory trading within regional groupings, but the level of discrimination should be made complete, i e, 100 per cent, as early as possible! The failure of the PTA to remove intra-bloc barriers in time may force the WTO to ask the PTA members to extend the tariff cuts within the regional union to all WTO members in accordance with the MFN principle.

Whether it would ultimately result in the formation of a free trade area or not, the accord would have far-reaching implications for India -Sri Lanka trade and hence for both the national economies. The existing literature on PTAs, which is quite extensive and rich, would help us delineate plausible effects of the new regime of freer trade between the two neighbours. The net welfare effect of the PTA, if we go by the conventional theory of customs unions [Viner 1950], would depend upon the balance between trade creating and trade diverting influences of the preferential tariff reduction. The preferential arrangement results in trade diversion when imports are switched from third country sources to relatively inefficient member sources. Trade creation, on the other hand arises when imports are switched from domestic sources to relatively efficient member country sources. Empirical studies undertaken in the context of existing PTAs based on the above approach do not entail any definite conclusion on the net welfare effect of such arrangements [Pomfret 1988]. Further, according to the above approach, even when there is net welfare gain, such gains from the preferential tariff reduction can be no better than that of unilaterally eliminating the tariffs on a non-preferential basis. Thus, according to the conventional theory, preferential trading arrangements are economically irrational, as compared to the first best option of non-preferential tariff cuts and therefore, can be explained only by non-economic motives [Pomfret 1988: 111-16]. Later developments in the theory of PTAs, however, could break the impasse of the above framework, by relaxing its restrictive assumptions and incorporating more dynamic effects of preferential trading arrangements, viz, scale economies, improved technical efficiency, possible terms of trade effects and higher growth rates [Lipsey 1960, Corden 1986: 111-23]. Thus, the theory can now explain proliferation of PTAs in terms of economic advantages of preferential tariff reductions that cannot be replicated by MFN cuts.

In short, a study on the bilateral free trade agreement between India and Sri Lanka will have to take into consideration all the plausible static and dynamic effects of preferential trading before arriving at any conclusion on its outcome. The objective of the present paper is more modest. We do not intent to problematise the issue as to whether the proposed PTA would be gainful to the partners taken together or individually. Instead, our focus would be on its differential impact on the regions within the national economies. As the existing studies show, even a successful PTA, which augment the welfare of individual partners and the community as a whole, could have highly varying impacts on different regions within each partner country. The question of inter-regional difference in the impact of the proposed preferential trading arrangement between India and Sri Lanka assumes importance in the context of the fears expressed by the southern Indian states, especially Kerala. The available evidence in this regard, which we present here, clearly indicate the

Figure:
Trade Deficit of Sri Lanka, Rest of the World and India



need for a more cautious approach in the implementation of the new treaty.

Recent Trends in India-Sri Lanka Trade

Before we analyse the trends in India-Sri Lanka trade and the likely impact of the free trade agreement on the same, it would be useful to have an overview of the external sector situation in both the partner countries. The literature on economic integration suggest that macro economic policies of partner countries, especially those pertaining to the external sector, would have a major influence on intra-community trade, hence also on the prospects of the free trade arrangement. In fact, lack of synchronisation of external sector policies among partners could prove to be a major irritant in the process of building up preferential trading arrangements. This problem is particularly true in the third world context where the countries are more vulnerable to external shocks. As some of the key indicators presented in Table 1 show, this question of vulnerability of the external sector would be a major worrying factor in the context of the free trade arrangement between India and Sri Lanka too. None of the partners can boast of a blemish less record in this respect, nor can any one of them claim to have reached a safe trajectory. Any instance of instability in either Sri Lanka or India, and the policies used to overcome the same (for instance, devaluation of the currency) would tend to drastically affect the equations of bilateral trade. As we shall argue later, such external sector developments would also have their implications for the regional impact of the preferential trading arrangement.

There are many reasons to believe that the new accord will result in significant improvement in the two-way trade between India and Sri Lanka. First, in recent years, India-Sri Lanka trade has been growing at a faster rate than their trade with the rest of the world. While the total trade of India and Sri Lanka with the rest of the world recorded an annual compound growth rate of 15.3 per cent and 13.3 per cent, respectively, during 1991 to 1996, India-Sri Lanka trade recorded a much higher rate of 23.9 per cent. Second, notwithstanding the recent spurt, the bilateral trade even today accounts for only a negligible share of their total trade. In 1996-97 trade with Sri Lanka accounted for only 0.63 per cent of India's total trade and the corresponding share of Sri Lanka is 5.75 per cent. The third and the most obvious reason is the preferential access that the new accord would be extending to the partners in each other's markets. The preferential arrangement would give the Indian exporters an advantage *vis-a-vis* their third country competitors in the Sri Lankan market and *vice versa*.

An important aspect of India-Sri Lanka trade from the point of view of the current discussion is the burgeoning trade deficit of Sri Lanka with India (Table 2). The imbalance in the two-way trade cannot be taken as a transient phenomenon. The persistence and the high magnitude of the trade deficit are good reasons to suspect structural roots to the problem. The severity of the problem is further clear from the fact that the Sri Lankan deficit with India accounts for an overwhelming proportion of the island country's overall trade deficit (Figure). Thus, for instance, while Sri Lanka's trade with India accounted for only 5.7 per cent of its total trade in 1996, the share of its trade deficit with India in the overall trade deficit was as high as 55 per cent.

A cursory examination of the structure of trade suggests that the new trade treaty, in all likelihood, would worsen Sri Lanka's trade deficit with India, not only in absolute terms but also as a proportion of the bilateral trade. India's exports to the island country, as Table 3 clearly shows, are dominated by complementary products, characterised as they are by either weak or insignificant import competition in Sri Lanka. The list of such products include transport equipment, machinery and instruments, drugs and pharmaceuticals, chemicals, etc. In fact, with respect to a wide range of products, the competition that the Indian exporters face in Sri Lanka is not so much from producers in that country as from third country suppliers. Therefore, the preferential treatment accorded to the Indian exporters *vis-a-vis* other foreign suppliers would have a direct and favourable effect on the Indian sales in the island market. Now, the higher the favourable effect of the Treaty on India's exports, the higher would be the pressure on Sri Lanka to push her exports to India and keep the trade deficit within manageable limits. It will assume added importance because any efforts towards improving the trade balance with India will have a significant bearing on improving Sri Lanka's overall external balance. This could be accomplished only through an increased penetration of the Indian market by focusing on those products where Sri Lanka has export potential or comparative advantage. What are the potential areas of higher import penetration of Sri Lankan exports to India? Only by answering this question can one identify the regions which are likely to be adversely affected by the new treaty.

Export Structure of Sri Lanka

Any discussion of the export structure of Sri Lanka has to be made against the backdrop of far-reaching economic reforms implemented since 1977. Even though, a detailed account of the policy changes is beyond the scope of the present discussion, it may be noted that the reforms initiated in Sri Lanka were much more thorough going than the reforms

introduced in India. These policy reforms were manifested interalia in the move away from the system of non-tariff barriers, drastic reduction in the rate and dispersion of tariff across different products, sustained devaluation of the Sri Lankan rupee and many other measures intended to attract foreign investment.

The policy reforms resulted in some major changes in the structure of exports. In 1977 structure of Sri Lankan exports exhibited all the characteristics of a typical underdeveloped economy, with the traditional primary commodities accounting for more than 75 per cent of total exports. Moreover, the exports were highly concentrated in a few products like coconut, rubber and tea. But, by 1992, the share of primary commodities declined to a level as low as 33 per cent of total exports. Along with the change in the commodity composition there has been a change in the ownership of exports as well. The share of foreign firms in manufactured exports increased from 9 per cent in 1979 to over 71 per cent in 1992 [Wignaraja 1998]. Thus, the reforms initiated since 1977 have been quite successful in attracting foreign direct investment. In this respect Sri Lanka's performance is rated on par with that of the south-east Asian countries. Interestingly, it is often argued that Sri Lanka's proximity to the large Indian market, apart from the liberal incentive structure that the policy reforms ensured, has been a major factor in attracting foreign firms.

These achievements of the Sri Lankan economy, commendable though they are, do not appear to pose any major threat of import penetration for the modern manufacturing sector in India, at least in the near future. An analysis of the manufactured exports at the disaggregate level reveals a very high level of concentration in low skill/low technology products. In fact, the share of skill-intensive items in manufactured exports of Sri Lanka has declined from 11.6 per cent in 1977 to 7.6 per cent 1992 [Wignaraja 1998]. Further, there is evidence in terms of revealed comparative advantage indices to argue that the competitiveness of Sri Lanka in skill- and technology-intensive products has been declining over time [Wignaraja 1998]. The disaggregated data on Sri Lanka's global exports presented in Table 4 conform to the above argument. The SITCs 5 and 7, which cover most of the technology-intensive items, are very poorly represented in the Sri Lankan export basket. This leaves us with tropical agricultural products and some labour-intensive manufactures, which account for more than 85 per cent of the export earnings. These areas, where Sri Lanka has proven competitive presence in the international market, could also be taken as the potential areas of Sri Lankan import penetration to the Indian market, viz, fish and its preparations, vegetables and fruits (mainly coconut, fresh and dried), tea, spices, tobacco manufactures, natural rubber, rubber manufactures, textile yarn, pearl and precious and semi-precious stones, clothing and accessories, and toys. But, unlike the Indian exporters to the islandcountry's market, the Sri Lankan exporters would be facing tough import competition in India. Significantly enough, India has well entrenched production base in all the areas identified above. More importantly, they are also prominent export items of India.

However, given the huge trade deficit with India, and the likelihood of its worsening in the context of the new treaty, Sri Lanka would be hard pressed to try and push the exports of the items identified above into the Indian market. Thus, Indian exporters of the products identified would find themselves in an unenviable situation of having to share a part of the hitherto protected domestic market with their arch rivals in the international market. Thus, the sectoral impact of the new agreement on India is fairly clear. The non-traditional manufactures especially, capital goods and chemicals, would find their market expanded to the neighbouring country. This, in the long run, as studies on economic integration suggests, might also help the producers in such sectors to reap economies of scale and attain higher competitiveness. Their exports to the Sri Lankan market would be more at the cost of third country suppliers than the Sri Lankan producers. The Indian industries which use natural rubber, copra, etc, as raw materials might also benefit because of the increased competition in the Indian market. The producers of tropical products and labour-intensive manufactures listed above, on the other hand, would tend to lose a part of their home market to Sri Lanka. The loss of control over the home market might also affect their performance in the international market.

Coming to the question of regional impact, it appears that the south Indian states would have to bear a disproportionately larger share of the adverse consequences of the new free trade treaty. South India accounts for a lion's share of both area as well as production of the crops, which are likely to face Sri Lankan competition. Their dependence on the listed tropical products, viz, tea, natural rubber, coconut, and spices is also well known to be reiterated. The importance of and the dependence on the above products would appear more dramatic in the case of Kerala. In 1996-97, coconut, rubber and tea accounted for about 66 per cent of the net-cropped area in Kerala. With the limited industrial base, these crops are also major sources of income and employment in the state. Therefore, even apparently minor changes in the above markets would have far-reaching effects on the state's economy.

Notably, the adverse impact of the treaty would not be limited to a reduction in domestic sales. International market for the products in question, like other primary commodity markets, are known for sharp price fluctuations. It was the presence of a fairly large and protected home market that used to save the Indian producers from the vagaries of international commodity market. The proposed regime of free trade with Sri Lanka would reduce the scope of government intervention and leave the producers at the mercy of market forces. The neo-liberal advice to the producers threatened by free imports from Sri Lanka would be to take on the challenge

Source: Centre for Monitoring Indian Economy (1998): Foreign Trade, Bombay.

of competition by reducing cost of production and enhancing productivity. The unprecedented crisis that the natural rubber producers of the country currently face would help us show how naive such arguments could be [Harilal and Joseph 1998]. The average productivity of 1,140 kg/ha in Kerala is quite high even according to international standards. But, the prevailing prices are not remunerative even to those who have higher than average levels of productivity. Cost of production, productivity, etc, are important parameters that determine prices, profitability and market shares of competitors. But, there are other important parameters also, many of which could be beyond the control of producers. The external sector policies, more specifically, those related to the international value of the currency, would have a major bearing on competitiveness and trade. This brings us back to the question of vulnerability of the external sector of partner countries. Both the countries have been depreciating their respective national currencies almost continuously over the last decade. While there were phases when the Indian rupee depreciated faster than the Sri Lankan counterpart, there were also periods when the Sri Lankan rupee depreciated faster than the Indian currency. The current phase appears to be one of deeper cuts in the value of Sri Lankan currency. We do not need to discuss its impact on the competitiveness of Sri Lankan exporters *vis-a-vis* Indian producers. We need to underline only the fact that there are many factors beyond the control of producers like the relative value of the currency, differential rates of inflation, etc, that shape their fate in the market and that the new environment of free trade with Sri Lanka would reduce the space of helpful state intervention.

In conclusion it may be reiterated that PTAs would have highly varying impact on sectors and regions within the community. There is no reason to believe that the case of India-Sri Lanka arrangement would be an exception. It is important, therefore, to foresee such effects and provide safeguards for the sectors and regions that are likely to bear the cost of adjustment. The experience of successful PTAs, especially that of the European Community, shows the importance of preparatory studies and careful planning in minimising such adjustment costs. The long preparatory phase and the communitywide debates that preceded the introduction of Euro may be cited here. It is this quality of transparency and willingness for open debates on the possible impact that are sadly missed in the context of the India-Sri Lanka treaty. It is true that there are certain inbuilt mechanisms in the bilateral agreement, like the negative lists, to take care of the problem of adjustment. But, how long can the negative lists be maintained? The Sri Lankan trade deficit and provisions of Article XXIV of GATT 1994 suggest that the period of negative lists cannot be too long. If so, what would be the measures to prepare the concerned sectors for the period beyond the negative lists? Is there any understanding on synchronisation of external sector policies? That many such important questions are left unaddressed does not augur well for the future of the new treaty.

Food for Profit

Madhura Swaminathan

Hungry for Profit: Agriculture, Food and Ecology edited by Fred Magdoff, Frederick H Buttel and John Bellamy Foster; *Monthly Review*, Vol 50, No 3, July-August 1998.

THIS is a special issue of *Monthly Review* devoted to questions of food and agriculture in the late 20th century. There are two major sets of themes running through this collection of articles. The first set deals with the control of transnational corporations (TNCs) over food production and the implications of growing concentration for the system of production and for the final cultivator or farmer. The second set deals with ecology and the role of modern technology, particularly biotechnology, in the quest for sustainable agriclture.

R C Lewontin gives a fascinating account of features of the capitalist development of agriculture in industrialised countries such as the US and the transformation of independent farmers into proletarians. Although there are still a large number of 'independent' petty producers, their powers of decision-making have been weakened to the point where they resemble workers. First, "farmers could make choices about the physical process of farm production, including what was grown and how much, and what inputs were to be used". Secondly, "farmers were themselves traditionally potential competitors with the commercial providers of inputs because they could choose to produce seed, traction power, and fertilisers themselves". Today, the agri-food business industry has taken away these choices from the farmers. Thus, even though they are technically the owners of the means of production such as land, farmers have "lost control over the labour process" and they are also alienated from the product, as they are not free to sell it as they wish. To put it differently, the farmer is in effect similar to a "putting-out worker characteristic of the first stage of capitalist production". This is illustrated by the experience of contract farming in the production of broiler chickens in the US. Many small farmers produce chickens under a four-year contract for Tyson Farms. The company provides the chicks, the feed and veterinary services. All decisions about inputs and farming practices are taken by Tyson and the farmer guarantees that he will not use any "feed, medication, herbicides, pesticides, ...or any other items except as supplied or approved in writing by the Company". Such a chicken farmer has little control over buying, selling or the process of transformation.

William Heffernan also deals with the spread of monopoly capital into agriculture. This process has been accompanied by horizontal integration at different stages of processing and distribution and the outcome is tremendous concentration of ownership and control in the production, processing and distribution of certain major food commodities. The four largest commodity processing firms (respectively) control 55 per cent of broiler production, 87 per cent of beef slaughter, 62 per cent of flour milling and 76 per cent of soyabean processing in the US. There is also a high degree of vertical integration. Cargill, for example, "is one of the three major global traders of grain, the second largest animal feed producer and one of the largest processors of hog and beef in the world". ConAgra is a major food firm with large interests in different stages of the food chain ranging from seed and fertiliser production, to feed production, broiler and meat production and 'TV dinners and pot pies'. These transnational companies are interested solely in the profits of their stockholders and neither in sustainable agriculture nor in the livelihoods of farming communities across the globe.

On the second theme, there is an excellent discussion of the "social, technical and ethical consequences" of biotechnology in agriculture in a paper by Gerad Middendorf, Mike Skladany, Elizabeth Ransom and Lawrence Busch. Biotechnological innovations modify two of the natural constraints of agricultural production, namely, the reliance on time and space. "The ability to produce cocoa in a laboratory", for example, can "decouple the manufacture of these foods from land-based production systems" and result in "economic collapse for populations in developing countries". What is of concern is that much of the research on biotechnology is being undertaken in private laboratories with very little public control or input. Given the enormous implications of research in biotechnology for agriculture and the livelihoods of millions, it is very important, as the authors argue, to link research with public policy and debate. Public access to information and public debate on technology policy is one way of democratising control over research. We need to develop systems of surveillance and safety and norms for the application of biotechnology.

Miguel Altieri points out that the first wave of environmental problems in agriculture were a consequence of increasing crop specialisation and the extensive use of inputs such as pesticides and chemical fertilisers. These problems included soil erosion, depletion of nutrient reserves, pollution of water, and pest resurgence. The second wave of environmental problems, however, stems from the introduction of biotechnology in agriculture. Altieri recognises that biotechnology can have beneficial impacts. However, under the control of multinationals, research in biotechnology is likely to be associated with environmental risks. The need to capture the market with a single product can lead to genetic uniformity and threaten genetic diversity. The incorporation of genes for insect toxins (such as from the bacteria Bacillus thuringiensis or Bt) into the plant variety can have unintended consequences (the toxin may be incorporated into the soil or have potential negative reactions on the other organisms). Ultimately, greater social control over technology will be required to generate an economically viable and environmentally sound agriculture.

The recent Cuban experience provides an interesting example of the shift away from capital-intensive agricultural technology. Peter Rosset documents how alternative agriculture was taken up in Cuba in response to the crisis of the collapse of the Soviet Union. In 1989-90, when trade with the Soviet bloc collapsed, there was a crisis in the import of food as well as fuel, machines, chemical inputs and all the other technological requirements of an advanced agriculture. The government started an innovative programme to substitute chemical inputs with biological inputs, for example, to shift from chemical pesticides to biopesticides, and from chemical fertilisers to organic fertilisers. The new technology required a new scale of production and the system of production based on state farms was also

reorganised and smaller management units were created. By 1995, the new strategy had helped Cuba overcome its food shortage.

In India, we are not unfamiliar with the problem of hunger amidst plenty. Janet Poppendieck's article argues that in the US, too, hunger exists amidst plenty and amidst waste. In recent years, there has been a lot of popular moblisation around hunger in the US as witnessed by the growth of soup kitchens, food banks, food pantries and the like. Ironically, as private charity has expanded, public commitments to the poor – public support and welfare – have shrunk. While the immediate solution lies in 'feeding the hungry', longer-term solutions to the problem of hunger require us to deal with the underlying problems of distribution.

This special issue also has papers by William Hinton on land reform in China, by Ellen Wood, J B Foster and Fred Magdoff on historical issues, and papers by Philip McMichael and Elizabeth Henderson on food politics.

Cultural Reorientation: A Northern View

G P Deshpande

Cultural Reorientation in Modern India edited by Indu Banga and Jaidev; Indian Institute of Advanced Study, Shimla, 1996; pp 419, Rs 500.

THIS massive volume is a collection of papers read at a seminar organised by the Indian Institute of Advanced Studies, Shimla, in 1994 or 1995 (the date of the seminar is not given in the book). The book was published in 1996. There are 24 essays brought together in the volume. A large number of them relate to Punjab. Two discuss music. One discusses modern art, while one discusses Telugu cinema. Almost all the essays follow the pattern of a historical narrative. How did things happen the way they did is their primary concern. Essays on Punjab are full of information, at times also insights. One is not certain if such a heavy emphasis on Punjab was altogether necessary and unavoidable. To make sense of so much material on Punjab in the company of a solitary article on Telugu cinema or a discussion of Thumri is not easy, to say the least. The present reviewer has read the book but clearly is not in a position to comment on all the essays. The comments would be necessarily of a general nature. It is only in the case of a few essays that one can possibly go into the details.

It is necessary to say that it is a very commendable exercise that the process of cultural reorientation of north Indians (the emphasis of the book is clearly on north India), an article on the Telugu cinema notwithstanding, has been looked at closely and with an insider's concern. The 'northern' view comes across very clearly when the question of why movements like Arya Samaj did not arise in the south is not even asked. Or in an otherwise scholarly and extremely well argued presentation, Javeed Alam sees 'Gandhi vs Savarkar' as a good example of "oppressed versions of insertion into and articulation of tradition". Now it is more than doubtful if such a view of Savarkar who dismissed the Srutis and Smritis as valid, let alone sacred, texts is justified by anything that he wrote or said. Interestingly, not only Alam's essay but quite a few others completely ignore the low caste interpretation or subversion of tradition. All the versuses' that Alam enumerates are, in a manner of speaking, upper caste or 'Savarna' versuses. This may be the reason why this enormous volume does not even once refer someone like Phule.

Alam's essay sits uncomfortably with Satya P Gautam's essay on 'Cultural Dilemmas in Colonial Societies'. As no effort is made even in introduction to reconcile the positions of different essays in order to arrive at an understanding of 'cultural reorientation', this is hardly surprising. The editors themselves must be aware of this limitation. Gautam holds the Congress guilty of "using caste and communal identities for the mobilisation of the masses" during the colonial period. One would have thought that Congress especially under Gandhi avoided precisely that. In fact in Maharashtra and Tami' Nadu there were caste-based mobilisations against the Congress which were more than blessed by the British. Equally, Gautam's statement that "we do not have a sense of our traditions apart from how they have been discovered or invented and projected by the western culture" is questionable Justice Ranade's or Bhandarkar's view of religion was not invented by the western culture. Their return to 'Varkari Sampradaya' was in fact an attempt to project a non-brahmanical tradition of our religious thought. It is one of our cultural dilemmas to place the non-brahmanical orientation of our culture which has a continuous tradition from the Bhakti period to the times of Phule and Ambedkar in a proper historical perspective. This volume is yet another evidence of the enormity of that problem resulting into the discussion of almost exclusively high caste (brahmanical) perspectives. We are face to face with three rather than two Indian orientations. One is the traditional brahmanical, the other is the non-brahmanical. The third orientation has been very neatly described by Vidya Rao in her essay on the Thumri easily the best of the collection. She talks of cultural forms "shaped at a time when Indian history, culture and social relationships were being reformulated". No account of cultural reorientation would be complete without reference to these three orientations. Most essays do not take this three-fold division into account.

In a space of a short review one cannot do justice to a book which has collected together 24 contributions. One may conclude this review with the comment of one of the two Hindi contributions, although the present reviewer's competence in Hindi is limited. M Pandey has not been able to decide whether to adopt a polemical mode or discursive mode for his argument. Consequently, his discussion of the relationship between the ruling classes and culture has tended to become a collection of declamatory statements. One suspects that he has an argument to make. His polemics do not let him do it in full. His analysis of Tulsidas, interesting in itself, deserved a more detailed and non-declamatory treatment.

Lastly, one must also ask a question of the editors. There is nothing wrong in having presentations in Hindi or another Indian language. But is it such a difficult thing to have them translated in English and presented in what is in fact an English language volume?

Trade and Empire

Tirthankar Roy

From Prosperity to Decline: Eighteenth Century Bengal by Sushil Chaudhury; Manohar, New Delhi, 1995; pp xvi + 377, Rs 500.

FROM the last quarter of the 18th century, Bengal was the chief partner of the European companies' Asiatic trade About a century later, the trade was in decline and Bengal was effectively under British rule. Sushil Chaudhury, while presenting a richly detailed account of the trade itself, argues that it was Bengal's 'prosperity', of which trade and industry were contributory factors, which encouraged the Europeans to conquer Bengal. In turn, the conquest led to the region's economic decline. In suggesting this, Chaudhury dissents with conventional views where the conquest tends to be attributed to chance, prior economic crisis, or political anarchy.

The argument illustrates one of the many reasons that make European trade in India a subject of enduring appeal, and full of unanswered questions even after decades of high-quality scholarship. The book effectively brings out this openness in the field by pointing out a number of important aspects not adequately researched before. However, the main strength of the book lies not in its polemical content, but in the extensive and diverse raw material from which its arguments were developed The book's descriptive content bears the mark of authority and many years of research and engagement in the field. All of these qualities contribute to making this work a major reference on the subject.

The opening chapters of the book (1-3) set out the background with a political history, broad outline of the European companies' trading activity in the region until the mid-18th century, and a description of the critical role of textiles in foreign trade. Chapters 4 and 5 describe evolutions in commercial organisation through this period. An important story here is the rise and decline of the institution of 'brokers', powerful intermediaries between the European firms and textile producers, in favour of paid agents of the firms. The broker arose, and disappeared, due to problems of a kind known to economists as 'asymmetric information and consequent hazards. Usually, the transition is seen by historians to mean reduced competition and increasing oppression of the buyers upon the suppliers. Chapters 6-8 deal with the main traded items, cotton and silk textiles. Chapter 9 takes up two minor tradables, saltpetre and opium. A distinctive feature of these chapters is the detail with which production organisation is discussed, including the profile of the producers both rural and urban, wages and earnings, location of industry, and the wide array of merchants and financiers engaged in the business of exporting Bengal products out of Bengal. Chapter 10 takes up the widely debated question of price movements, and chapter 11 returns to interpretations of political history.

At several points, the book makes significant original arguments. The following are some examples The decline of the brokers has been seen in other studies as a result of the European firms' decision not to use the services of local merchants, and thus to signify a decline of mercantile enterprise generally. Chaudhury disputes this view, and suggests that the merchants themselves chose not to take part in the institution. It is generally believed that prices in Bengal – of both tradeables and non-tradables – were subject to a steady upward pressure after the 1720s, and especially in the 1740s. This is seen as an effect of European demand, the bullion import as a result, and economic dislocation caused by Maratha incursions in Bengal. Chaudhury, from a painstaking reconstruction of price statistics, concludes that no secular and general increase in prices of foodgrains or the 'contract prices' of textiles was in evidence. In turn, the finding questions the notion of a general dislocation and crisis in pre-1757 Bengal. Perhaps the most significant new emphasis in the book is on the role of 'Asian merchants' and overland trade in this period. These groups were the most important export merchants of Bengal prior to the European ascent. Chaudhury argues that they remained important, in fact they exported greater value than the Europeans in the mid-18th century. This point has not been made before in the literature. On the whole, these reinterpretations in the book create a more diverse concept of mercantile enterprise operating in Bengal, qualify the importance of European trade for the region, and create a different image of the regional economy in the period, than are currently available.

Having said that, Chaudhury at times seems to overstate his findings. The central thesis, Bengal's journey from 'prosperity' to 'decline', is itself an example. It is implicitly assumed, and Chaudhury is not alone in making such an assumption, that foreign trade created prosperity in Bengal. But what is the evidence? Wages and earnings of weavers in 18th century Bengal were, by the book's own evidence, low. Some interesting data cited on pages 174-75 suggest that the share of export in cloth production in the mid-18th century was around 20 per cent. The share of textiles in employment could not have been very much more than 5 per cent. Given that textiles represented more or less the only important tradable from Bengal, the share of export in the region's income was realistically around 1 per cent. This is very small ratio indeed to believe that trade had great transformative potential. In reality, cloth export was a small and exceptional trade superimposed on a primarily non-commercial subsistence economy. On the book's own evidence, 18th century Bengal was a region with a progressively weak government, almost no commerce without patronage, a chaotic currency regime and high interest rates, and a 'capital market' virtually under the thumb of one banking house. Fraud, power and oppression were inseparable from Bengal's foreign trade at any time in its pre-modern history. These features do not go well with a system where markets can generate overall 'prosperity'.

But this objection is largely semantic. That the progressive consolidation of British rule in Bengal changed the nature of economic transactions in textiles, and made the terms adverse for the suppliers, is evident. Chaudhury has illustrated this idea with a work that should become, on the strength of the labour and the learning that went into it, a major presence in the field of early modern trade and industry.

March 1999

REVIEW OF AGRICULTURE

Emerging Crisis in Punjab Agriculture

Severity and Options for Future

Ramesh Chand

As is often the case, agricultural diversification is being suggested as the future strategy to address the problems confronting Punjab agriculture. The present paper, based on empirical evidence, examines the scope of agricultural diversification by analysing various dimensions of the suggested alternative. It discusses prospects of the diversification alternative and its implication on employment, income, natural resources and ecology. An attempt is also made to propose future strategy for agricultural and economic development of Punjab in the post-green revolution period.

THE impressive growth rates achieved in agricultural production in Punjab are well known and have been widely acclaimed as a success of the agricultural strategy centred on the green revolution technology. There is a widespread belief that the 'Punjab pattern of agricultural development' and green revolution technology are the best route for agricultural development in other parts of the country. The general impression about Punjab agriculture is that it is highly productive, continues to have vast potential for growth, and provides good farm income to producers. This impression might have been true during the early days of green revolution; recent reports reveal disturbing trends about Punjab agriculture and the future of green revolution in the state. Productivity of rice and wheat, the major crops of the state which occupy about 70 per cent of its gross cropped area, is reported to have approached a plateau and farm incomes are reported to be stagnant and insufficient for a decent living. There is a growing realisation about the degradation of land, water and environment due to the current pattern of agricultural production and its sustainability is under question. Though some concern has been expressed by researchers about disquiet aspect of Punjab agriculture during the past five-six years, these were not paid serious attention by the state till recently. However, the rising discontent among the farm community due to their failure to get aspired farm income, and problems like declining water-table in some part, waterlogging in other parts, soil degradation and environment pollution have reached such proportion as to force the state government to make serious efforts to address these problems.

As a step in this direction, Punjab Agricultural University, Ludhiana, at the instance of the state government, organised a two-day brain storming discussion on October 23-24, 1998, to discuss the conditions of farmers and farming in Punjab and to chalk out future strategy for agriculture. The meeting was attended by some economists from the state and outside, agricultural experts of Punjab Agricultural University and the state government officials.

The agenda paper discussed during the meeting made startling revelations about the conditions of farmers and sustainability of current agricultural strategy.[1] Some of the assertions made in the paper which point to the underneath crisis in Punjab agriculture are:

(1) Economic condition of vast majority of farmers has deteriorated and cannot be improved with the existing cropping system and technology which has already been exploited to 75 per cent potential.

(2) Family income of about 47 per cent of the farmers from crop plus dairy is lower than the income at lowest pay scale for unskilled worker in the state. The paper further says that about 20 per cent of farming population is below the poverty line income.

(3) The water-table in the central Punjab is going down at the rate of 0.23 cm per annum. If this decline continues for the next 15 years, about 2 lakh centrifugal pumps will need to be replaced by submersible pumps which at current prices will cost Rs 2000 crore or about Rs 5,000/hectare of net sown area.

(4) In some part water-table has risen by four-five metres during 1984 to 1994 and led to problem of salinity and waterlogging.

(5) Widespread deficiency of micronutrient has appeared in the soil and there is increase in weed infestation, pest and disease outbreak.

(6) Burning of combine harvested rice straw is resulting in serious environment pollution.

Though there was some disagreement among the participants about estimates of farm income, everyone felt the necessity for urgent action and suitable strategy to put Punjab agriculture on a new growth path which is sustainable from natural resource point of view and which provides reasonable income to sustain interest in farming.

Whenever there is a problem related to agricultural production, income or employment, agricultural diversification is most often suggested as the alternative. Accordingly, the agenda paper also suggested diversification through vegetables, fruits, dairying, etc as future strategy to address the problems confronting Punjab agriculture, without analysing various dimensions of suggested alternatives. The present paper, based on empirical evidence, examines the scope of agricultural diversification to address the problems confronting Punjab agriculture. It also discusses prospects of various diversification alternatives and analyses their implications on employment, income, natural resources and ecology. An attempt has also been made to propose future strategy for agricultural and economic development of the state in the post-green revolution period.

The paper is organised into six sections. The first section discusses the growth rate in agricultural output and per capita income in the recent period compared to the earlier period. Section II compares performance of various crops and analyses prospects of diversification in the crop pattern. Possibility of diversification through dairying are examined in Section III. Causes of unemployment in the state and scope of employment generation through diversification and other strategies are explored in Section IV. Impact of wheat and paddy cultivation on natural resources like water, land and environment and remedies to check their degradation are discussed in Section V. The last section contains policy suggestions

and discusses strategy to meet the current challenges.

The study is based on secondary data at state level and micro investigations at grassroots level based on field survey of 300 farm households in Ludhiana district which is agriculturally most advance district of the state.

I
Growth Rates in Output and Income

The growth rate in agricultural and total net state domestic product (NSDP) and per capita income for the Punjab state and for the whole country during the 1980s and the 1990s to examine the economic progress in the state in the recent period are presented inTable 1. The growth rate of NSDP agriculture followed a sharp decline during the 1990s compared to the decade of 1980s. It is the first time since the onset of green revolution that growth rate of agricultural output in Punjab is lower than the all India level. When the current growth rate in agriculture income (NSDP) is netted out for population increase to arrive at per capita income, the growth rate comes out to be less than 1 per cent.

Similarly, the performance of total economy is also found to be deteriorating and below the national average as is evident from the growth rates in total NSDP and per capita income (*vide* Table 1). This is a depressing picture for the state which has enjoyed much higher growth rate than national average for a long time.

II
Cropwise Performance and Substitution Possibilities

Several indicators can be used to compare performance of various crop alternatives and to get an idea about the possibility and consequences of diversification of existing crop mix. Our interest is to study the performance in terms of value productivity, profitability, employment and impact on environment and natural resources. Detailed information on resource use, costs, returns, value of output and other relevant aspects for the important crops grown at the sample households is presented in Table 2 which can be used to compare inter-crop performance and to reveal impact of crop substitution on profitability, resource use and environment, etc.

Impact of cultivation of different crops on soil health can be captured to some extent by comparing use of inorganic fertiliser and weedicides in these crops as these inputs are said to be causing problems like soil chemicalisation and nitrate pollution. Among the crops of rabi season, use of inorganic fertiliser is highest in potato cultivation (108 kg NPK/acre) followed by wheat with 78 kg of plant nutrients. Requirement and application of plant nutrients is quite high in vegetable crops but this requirement is being met mainly from farm yard manure. In wheat crop, small expenditure on micro nutrients was also incurred Use of herbicide/weedicides has been quite common in wheat cultivation.

Application of plant protection chemicals, which has been used to indicate the impact on environment pollution, is nil in wheat crop, whereas, potato, rapeseed/mustard and rabi vegetables involve frequent use of such chemicals. Labour employment is 307 hours/acre in potato and 255 hours in other vegetable crops of rabi season. Per acre labour use in wheat, barley and mustard cultivation is around 127 hours. Coming to water use, sample farmers applied 8 irrigations to potato and vegetables and 5-6 irrigations to other crops. Value productivity and net return from vegetable crops is significantly higher than the competing crops. Potato and wheat rank second in productivity and net returns respectively.

Among kharif crops, highest use of inorganic fertiliser is in paddy (106 kg NPK/acre) followed by vegetable crops (77 kg). Minimum application of NPK as well as farm yard manure is reported in moong crop. Micro nutrients were applied only to paddy crop. Weedicides use is quite common in paddy and cotton crops. No chemicals were used for weed control in pulses. Highest human labour use was reported in vegetable cultivation which provides 539 hours employment per acre. Cotton ranks second with 276 hours and paddy enjoys third position with 248 hours of labour use per acre. As was the case with rabi season, vegetable cultivation gave highest output and income in kharif season also. This was followed by paddy.

Sugarcane is another important crop which is often suggested as an alternative to reduce domination of wheat and paddy in the state. Since sugarcane is an annual crop and yields output once in a year, its performance was compared with the performance of wheat-paddy rotation. Per acre labour use in sugarcane is 598 hours compared to 374 hours in wheat and paddy. On revenue side, one acre of sugarcane at the sample farms provided gross return of about Rs 11,000 which is Rs 3,500 lower compared to wheat-paddy rotation. Similarly, net return from sugarcane is 15.4 per cent lower compared to the combined net return from wheat and paddy crops.

Besides profitability, risk plays an important role in the choice of crops. Wheat and paddy exhibit lowest instability in their yield during the last two decades (vide Table 3). Because of strong and assured government price support, price instability is also lower in wheat and paddy. Consequently, gross returns from wheat and paddy fluctuated only by 10 and 19 per cent from the trend line, respectively, compared to 29 to 44 per cent instability in the other crops (Table 3).

The results presented in the preceding paragraphs show that the performance of wheat crop, at prevailing inputs and output prices, is better compared to other crops of rabi season in most respects. Use of plant protection chemicals, which are considered harmful for environment and for human health, is almost nil in wheat crop, whereas other crops capable of competing with wheat require heavy doses of plant protection chemicals. Water requirement of wheat is also quite low compared to potato and vegetables. No doubt, weedicide use is highest in wheat crop but this is not due to crop's intrinsic requirement; there are economic reasons for it and the same function can be performed by human labour. Among kharif crops, vegetable crops give significantly higher profitability compared to paddy. Besides, vegetable crops require 1/4th irrigation compared to paddy. However, compared to paddy, vegetables involve very high use of plant protection chemicals. Thus, it can be concluded that no crop alternative is superior to wheat and paddy in all the aspects and any change in crop pattern away from wheat and paddy would have mixed impact on crop income and ecological and environmental variables. If on one hand any change in crop mix reduces degradation of soil and mitigates water scarcity, on the other hand it results in environmental pollution through use of

plant protection chemicals.

Suggestions have also been made to diversify crop pattern in the state through fruit crops, and concerted efforts have been made in this direction in the past two decades. These efforts have met very limited success and the area under fruits has not reached even half a per cent of total cropped area. Though demand-side factors for promoting horticulture in the country are favourable the supply-side factors in Punjab are not promising. The state does not enjoy the natural (climatic and soil related) advantage in commercial production of quality fruits. Except for kinnow, quality of most of the fruits produced in the state remains inferior to the quality of fruits from other major producing regions. For example, grapes, mangoes, oranges, pear, plum produced in Punjab cannot compete in the market with grapes from Maharashtra and Karnataka, mangoes from Uttar Pradesh (UP), Andhra Pradesh, Bihar and Maharashtra, oranges from Nagpur region and pear and plum from the hill region.

III
Diversification through Dairying

As green fodder is the main input for commercial dairy, its expansion, through the increase in area under green fodder, results in diversification of crop pattern. Though per capita production of milk in Punjab is well above the level required for a healthy diet, the availability in most other states and for the country as a whole is quite low. There is a gap of about 39 per cent between per capita milk production and the minimum level (250 grams) of milk recommended by the Indian Council of Medical Research. Similarly, despite higher dependence of Indian population on vegetarian diet, per capita milk availability between India and the rest of the world has a gap of 53 per cent. These figures underline the need and scope for substantial increase in milk production in the country.

In addition to the need to fill existing gap, future demand for milk would also increase due to population growth and rise in per capita income, as the income elasticity of demand for milk is positive and close to one (1.15 for rural and 0.99 for urban population) [Radhakrishna and Ravi 1992].

Punjab state enjoys the advantages like sufficient availability of green fodder and an efficient system of rural transport and road network to promote commercial dairy. The scope for large scale expansion of dairying is also evident from the fact that to bridge 1 per cent gap between availability

and minimum milk requirement in the country about 4 per cent increase in milk output in Punjab would be needed, and India has about 40 per cent gap between the availability and minimum requirement of milk. Therefore, both the demand as well as supply side factors seem quite favourable for expanding dairy industry in Punjab.

Expansion in dairy activity, besides resulting in diversification of crop pattern due to shift in area in favour of fodder crops, would be beneficial in improving soil health through increased availability of organic manure. An exercise was done, using the sample information, to study what would be the impact of expansion of dairying activity on the crop pattern (Table 4). Green fodder requirement of an average dairy unit[2] consisting of 3.21 in-milk, 3.51 dry and 1.01 heifers was met from an area of 1.48 acres in kharif and 0.97 acres in rabi season. Assuming no change in productivity, breed mix and age composition of dairy animals, raising milk production by say 'X' per cent would entail same 'X' per cent increase in the number of dairy animals (dry and in-milk animals and heifers). This way, 10 per cent increase in milk production would result in expansion of area under fodder from present level of 21.23 per cent to 23 per cent in kharif and from 13.94 per cent to 15.16 per cent in rabi season. Since area under the other crops is already too small, the shift in favour of fodder crops would come from wheat and paddy crops. Our estimates reveal that meeting 1 per cent of the milk deficit in the country from Punjab would reduce share of paddy and wheat in net cultivated area by 1.09 and 0.60 per cent, respectively.

IV
Agricultural Diversification and Employment

It might look somewhat strange that despite high growth rate in economy and agricultural productivity, unemployment reported in Punjab is no less than rest of India. According to the NSSO estimates, unemployment rate in Punjab during 1987-88, based on usual status, ruled 2.9 and 7.4 per cent for male and female workforce as compared to 2.8 and 3.5 per cent at all India level, for rural areas. This raises the issue that when lakhs of migrant labourers from Bihar, east UP and some other states find employment in agriculture sector in Punjab then why there is high rate of unemployment among its own rural workforce?[3]

If we look at the possibility of creating more on-farm employment in the state it is found that attractive crop alternatives are available to do so (Table 2). Similarly, among non-land based activities, there is tremendous scope to raise employment by shifting area from wheat and paddy to fodder crops and by raising dairy on the same area. Results of our field study show that labour employment in dairy, that can be raised on fodder from a given area, plus labour use in fodder production is 7.3 times the labour use in paddy and wheat cultivation on the same area [See Ramesh Chand 1996, ch 8 for more details]. However, the relevant question is: would this type of employment generation reduce unemployment for the farm youths in the state? The answer seems no!

Unemployment of farm youths in Punjab is not due to lack of work opportunities in farm sector[4] but due to their strong preference to go for non-farm jobs. Though employment opportunities would be available at other farms, workers of farm families not having enough work opportunities at their own farms would generally not work as labourers at other's farms due to social stigma and taboos. This is the reason that lakhs of migrant labourers find work opportunities in Punjab agriculture while some of its own workforce remains unemployed. Second, during the past two decades literacy in Punjab has improved sharply and the young generation is not only by and large literate but also having secondary or higher education. There is a serious problem with the educated youth, almost throughout the country, that they shun manual jobs like those in agriculture and look for white collar employment [Vaidyanathan 1994]. Also, agricultural jobs are considered low paid compared to other sectors. Third, the adult workforce in Punjab possesses improved human capital and entrepreneurial and managerial skills, and young people look for challenging work opportunities to apply their energies. Traditional crop production does not offer any challenge and satisfaction to them. Fourth, improved income, higher interaction with market and exposure to electronic media and urban lifestyles have highly influenced the young generation in preferring consumerism and modern style of living. Therefore, the youth search for well paid jobs. And lastly, due to high level of income, Punjab society can afford to keep some of the family members unemployed for a fairly long period with the hope for obtaining better jobs some day.

It is thus clear that the solution for unemployment problem in the state lies in creating jobs in non-farm sector. How can this be done? The standard answer has been that the state should go for industrialisation at a faster rate. However, the past experience shows that expansion of conventional industries in Punjab did not do much to offer jobs to the rural youths from within the state. If one examines the profile of industrial workers in Punjab it would be observed that industry has preferred manual labour from outside the state and workers for non-manual jobs from the state's urban population. The reasons for preference for outside workers are: (1) these workers are available at a lower wage rate compared to local labour, (2) outside labour has weak political clout

TABLE 4. IMPACT OF INCREASE IN NUMBER OF DAIRY ANIMALS ON THE CROP PATTERN AT SAMPLE FARMS

Average number of livestock /household

Yield	10	20	26	7	7	21	27
Return	19	33	41	10	29	44	40
Price	21	23	27	8	31	31	39

Note: Instability in the variable say (Y) is computed by taking standard deviations of $[\ln(Y_t/Y_{t-1})]$, which shows average deviation from the trend line $\ln Y_t = b_0 + b_1 T + e_t$.

and low bargaining power, (3) in case of industrial dispute it is easy to deal with outside labour compared to local labour. Workers from the urban areas are preferred for non-manual jobs because they mould themselves easily into industrial and business/corporate culture and they belong to similar cultural background as the industrialists, top executives and management. Secondly, the rural youths do not possess the special skill useful in industry nor do they have aptitude to work in conventional industries owned by private sector. Moreover, share of industrial employment in total employment is very small, which is easily filled by the manpower from urban pool.

Rural youth possesses some advantage over their urban as well as migrant counterparts in agro-processing industries which involves some dealings with rural people, like procurement of raw materials like milk and sugarcane from rural producers, or where some knowledge about the farm produce is useful in processing and other activities. Accordingly, milk and milk product industry, sugarcane industry, vegetable and fruit processing industries, agricultural raw material using industry are some examples where rural youths can have some advantage in securing employment.

Punjab has excellent network of metalled roads and transport and reasonably good industrial infrastructure throughout the state. These factors are quite useful for spatial distribution of industrial units, so that the workers do not have to migrate from their rural habitats. Therefore, industrial policy of the state should be to encourage small units in semi-urban or rural locations where rural youth can work as a whole-time or part-time worker while staying at their native places.

V
Agricultural Diversification and Natural Resources

In this section we look at various aspects of natural resources' degradation and over-exploitation, and examine how diversification of agriculture would affect these resources and environment.

Land degradation: Progress of green revolution technology, till early 1990s, rather than causing increase in waterlogged and saline soils, has been associated with steady decline in the degraded land. Area under barren and unculturable lands has decreased from 208,000 hectares in pre-green revolution period to 72,000 hectares in post-green revolution period. Between 1965-66 and 1991-92, saline and waterlogged area has been reduced to 1/4th and culturable wastes declined from 83,000 to 36,000 hectares. *According to Chopra (1990) installation of a large number of tubewells in the 1970s and early 1980s* provided vertical drainage which helped in limiting the extent of waterlogging and salinity. The second factor for decrease in land degradation is the profitability of green revolution crops which made it economically attractive to reclaim degraded land.

Of late, the situation has changed dramatically. The south-west region, particularly Faridkot district, where cotton was the major crop, has been worst affected by rising water-table, and thousands hectares of land have become waterlogged. Other kind of land degradation attributed to intensive cultivation of wheat and paddy is nitrate pollution and excessive chemicalisation of soils and rising deficiency of micro nutrients [Chopra 1990, 1993]. Since soil is a living matter, increase in application of chemicals beyond certain level is injurious to soil micro-organisms which are very essential for maintaining soil structure and basic fertility. This problem is not irreversible and the remedy lies in increasing organic matter in the soil. This can be done through increased use of animal dung, green manuring and alike measures.

Agricultural diversification through dairying or pulse crops are some of the

Note: 1 Other factors include non-agricultural uses like industrial and human consumption.

options which can check soil degradation and restore soil health and fertility of degraded lands. Expansion of dairy would be helpful in two ways. One, it would result in shift in some area from wheat and paddy, which are considered problem creating crops, to fodder crops, some of which are legume. Two, it would increase availability of organic manures (animal dung) for crop production.

Environment pollution: Burning of crop residues and application of insecticides/pesticides are the major source of environment pollution by agricultural activities. Burning of crop residues of paddy and wheat generates smoke which makes the atmosphere suffocating in the months of April and October. To quote one such incidence, due to burning of paddy straw, a thick fog engulfed Ludhiana town and large area in its surroundings around October 15 this year causing a panic due to very poor visibility during otherwise bright season and irritation to eyes. The untimely rain came to the rescue of the people by settling the smog.

Each year more than 5 million tonnes of paddy straw[5] is destroyed by burning and only a small fraction is used for industrial production.[6] Rice straw is not used as feed for animals because there is sufficient availability of green fodder and wheat straw in the state which are superior feed compared to paddy straw.

Air pollution caused by burning of rice straw can be checked by promoting industrial demand for straw as it can be used to manufacture products like strawboard, paper, alcohol, mats and ropes. It is a pity that despite lot of concern about biomass scarcity in the country there is reckless wastage of millions of tonnes of biomass, that too at a cost to environment.

Some of the wheat straw is also burnt in the fields harvested by harvest combines but the problem is confined to limited area.

Coming to the use of insecticides/pesticides, the results of our study show that use of plant protection chemicals was nil in wheat and very little in paddy, whereas the crops which have potential to compete with wheat and paddy are applied heavy doses of plant protection chemicals. The only alternative which does not involve use of plant protection chemicals is production of fodder crops, ie, diversification through dairy activity.

Water resource depletion and degradation: Studies on groundwater balance in Punjab have observed that the water-table has been receding in many parts of the state due to excess of draft over the recharge [Baldev Singh 1992; Surender Singh 1991 and Prihar et al 1993]. Severity of over-exploitation of groundwater can be judged from the fact that withdrawal of groundwater exceeded recharge in half of the state's districts and in 58 per cent of the blocks (termed as grey) during 1991-92, the latest year for which information is available. The extent of over-exploitation in these districts varied between 7 and 159 per cent with average at 40 per cent [Dhawan 1995]. A study conducted by PAU [Prihar et al 1993] indicates that water-table in the state is declining at the rate of 0.11 metre every year.

Though many factors are responsible for over-exploitation of groundwater, the problem is being largely attributed to rice-wheat production system, which has come to dominate crop pattern in the state during the post-green revolution period. Second, it is said that paddy, which is a crop of wet-land areas, is basically not suitable for large scale cultivation in the state. In order to understand the role of various factors in groundwater depletion and to evolve remedial measures to mitigate the problem we have estimated to what extent wheat-paddy rotation is responsible for the water depletion. It is also explored whether diversification through other crops and activities would rectify the situation.

As there is close coincidence between expansion of area under paddy cultivation and incidence of water depletion, it is strongly believed that paddy is the main culprit for the problem. This impression is reinforced by the fact that paddy requires many times more irrigation compared to the crops it has substituted – as it is generally believed that water consumption by a crop is proportional to its irrigation requirement. However, a study conducted by PAU, Ludhiana, [Prihar et al 1993] shows that this is not entirely true. This study provides estimates of actual water used by important crops, (transpiration plus evaporation) net of seepage water, ie, part of irrigation water that percolates back to water-table, which show that paddy consumes only 22 per cent higher water compared to maize and 12 per cent higher water compared to cotton. Whereas, irrigation needs of paddy are 4 and 4.5 times the irrigation needs of maize and cotton (Table 5). The study also shows that sugarcane draws more heavily on water than the sum of net water actually consumed in wheat and paddy cultivation.

The next question now is, does the difference in water requirement due to shift in crop pattern, ie, the difference in actual water consumption between paddy and other kharif crops and wheat and other rabi crops, explain the negative water balance in the recent years. To find answer to this question we have estimated incremental water requirement between early 1970s and early 1990s attributable to: (i) shift in crop pattern, (ii) expansion of net sown

TABLE 8: ESTIMATES OF IMPACT OF CROP DIVERSIFICATION ON WATER BALANCE IN PUNJAB

Change	Impact on Water Balance	
	000 Hec Metres	Per Cent Change in Existing Water Deficit*
Replacing 1 per cent area under paddy by maize or alike crops	+2.60	–0.146
Replacing 1 per cent area under wheat by gram or alike crops	+3.24	–0.182
Replacing 1 per cent area under paddy and corresponding area under wheat by sugarcane, or, increase in sugarcane area by 92 per cent	–113.83	+6.39
Area share of paddy reduced to the level of TE 1972-73 by shifting paddy area to maize or alike crop	+185.72	10.43
Area share of wheat reduced to the level of TE 1972-73 by shifting wheat area to gram or alike crop	+20.10	1.13
Area share of wheat and paddy reduced to the level of TE 1972-73 by shifting area to grain and maize or alike crops	+205.83	–11.56

Note: * '+' indicates increase and '-' indicates decrease in the exiting water deficit.

TABLE 9: ANNUAL CAPITAL OUTLAY ON AGRICULTURE AND ALLIED HEADS IN PUNJAB AT 1980-81 PRICES, 1974/75 TO 1995/96

Capital outlay	1974-75 to 1978-79	1980-81 to 1984-85	1985-86 to 1989-90	1990-91 to 1995-96
Total, Rs Crore	319	293	153	178
Per hectare net sown area Rs	768	698	365	424
As per cent of NSDP Agri	13.46	14.34	6.08	7.23
AS per cent of total NSDP	6.90	6.67	2.73	3.30

area, and (iii) increase in cropping intensity (*vide* Table 6).

The exercise reveals that the shift in crop pattern in favour of paddy is responsible for 4.65 and shift in favour of wheat for 2.29 per cent of the over-exploitation of water. The main factor has been additional area brought under cultivation during the last two decades through (i) expansion of net sown area, which witnessed an increase of 3.44 per cent, and (ii) increase in crop intensity, which recorded a jump of 25 per cent during this period. These two changes resulted in expansion of gross cultivated area by 29.3 per cent.

Additional area brought under paddy and wheat cultivation accounted for about 43 per cent and 15 per cent of the deficit respectively. The combined impact of change in crop pattern and area expansion on account of paddy is about 47 per cent while wheat is responsible for 17 per cent of water depletion. Increase in water use by other sources (non-agricultural uses) is responsible for about 31 per cent of the present water deficit in the state. Thus, increase in agricultural as well as non-agricultural uses of water are responsible for declining water-table in the state though contribution of former is almost double the latter. The increase in water use for agricultural purposes has resulted mainly due to additional area brought under crop cultivation,[7] and profitability of green revolution crops, namely, wheat and paddy is the underlying factor for this. This area was previously put to land uses like fallow, unculturable waste, barren land, saline or waterlogged area.

Apart from the factors discussed above, the policy on water pricing is also aggravating the problem. Electric motor operated tubewells have come to dominate the irrigation sector in the state for which fixed nominal tariff was paid till recently; the present state government has waived even the nominal tariff and declared free supply of electricity to agricultural sector. This leaves no incentive with the farmers to economise on water and encourages indiscriminate and excessive water use. This assertion is supported by the PAU study which shows that irrigation treatment to paddy with 2 days drainage, between complete infiltration of ponded water and subsequent irrigation, provides higher yield compared to the farmers' practice of continuous submergence of paddy (Table 7).

Similarly, in wheat crop, the studies in rainfed area show that with judicious use of inputs, only 2 irrigations can result in 40 quintals yield per hectare which is at par with the yield obtained with five-six irrigations. Excessive irrigation in most of the cases causes damages like leaching of nutrients causing economic losses, pollution of groundwater due to leaching of chemicals, cost of energy to lift excessive water and wastage of scarce water resource.

Can Crop Diversification Check Groundwater Exploitation?

We have discussed in the previous section that the most important factor underlying over-exploitation of groundwater in Punjab is increase in crop intensity and net sown area. Increase in cultivated area on account of both these factors has gone mainly to paddy and wheat crops. Now the issue of interest is that if some of the area under wheat and paddy is replaced by some other crops how would it affect strain on water resources?

Though it would be of interest to see how diversification through vegetables, floriculture and fodder crops, which hold the potential to replace some area under wheat and paddy, would affect water resource, the information on net water consumption (ET demand) of these crops is not so far available. Therefore, we have examined the likely impact on water demand resulting from diversification through only those crops for which data on ET demand is available (the results are presented in Table 8).

The exercise reveals that, if the estimates of net water demand provided by PAU study for various crops are considered as reliable, the change in crop pattern away from paddy or wheat in favour of less water intensive crops would be of small help in reducing water depletion. When paddy crop is totally withdrawn from the state, the gap between water use and availability reduces by about 15 per cent. Another scenario in which share of paddy and wheat in GCA is reduced to the level prevailing in early 1970s, when there was no strain on water resources, existing water deficit decreases by about 12 per cent (10.43 per cent on account of paddy and 1.13 per cent on account of wheat).

Based on these findings we conclude that if the challenge of over-exploitation of water is to be tackled, following measures need to be adopted:

1 Indiscriminate and excessive use of irrigation should be checked through volumetric pricing of water, which in the case of electric tubewells means levying energy (electricity) used for irrigation based on actual use.
2 In the areas with serious water depletion problems (known as dark blocks) some incentive for keeping a part of land fallow should be considered.
3 Diversification of existing crop pattern with suitable crops would result in some, though small, savings of water. Since no single measure can result in large reduction in water use, the strategy should be to make use of such small savings wherever possible.
4 Incentive should be provided for installation of water saving devices like drip and sprinkler, etc.
5 Cultivation of crops like sunflower during peak summer season[8] should be discouraged. Similarly, cultivation of sugarcane in areas facing declining water-table should be discouraged.
6 Serious efforts need to be made on supply side to conserve and harvest maximum of rain water during the monsoon season.

VI
Future Strategy and Policy Suggestions

Punjab farmers have made high level of investments in agriculture due to which any activity having low level of outturn, despite high rate of profitability over variable costs, would not find favour with the farmers. Therefore, only those enterprises can compete with the existing ones whose value productivity is high. Second peculiarity of Punjab agriculture is that due to strong infrastructural network and high exposure to mass media, high competitive spirit and innovativeness of the state's farmers any potentially profitable enterprise gets quickly adopted by large number of farmers which results in glut in the market leading to violent price crash when the commodity is not of importance for mass consumption.

Keeping these two characteristics in mind, the state should follow three types of diversification; one, through items of mass production and consumption; two, concentration on area specific enterprises of moderately high value; and three, limited diversification through non-conventional high value items of elite consumption.

The enterprises in the first category, whose production should be encouraged at small scale but throughout the state, include milk (dairying), pulses, oilseeds. Since these are the items of importance to masses and there is wide and growing gap between their availability and requirement, even large increase in their production can be absorbed. Objectives of diversification through these enterprises are to increase crop diversity, make production broad-based, ameliorate environment, ease the strain on natural resources, and reduce ecological degradation

The second category should include moderately high value commodities like vegetables, potato, onion, cotton, basmati rice and sugarcane. These enterprises should be carefully earmarked for different agro-climatic sub-zones based on the comparative advantage, and different activities should be encouraged in different areas to avoid production gluts and price crash. Main objective of diversification through this type of activities is to enhance farmers' income and to provide growth impetus to the economy.

The third type of diversification strategy should focus on items like floriculture,[9] exotic vegetables, mushroom and alike crops. Most of these commodities involve high use of capital and high risk and their marketing generally requires locating suitable buyers and some sort of contract with the buyers. Secondly, demand for these commodities is very narrow and they being highly perishable and sensitive require special arrangements for transportation, packaging and storage. No doubt domestic as well as international demand for such commodities is becoming buoyant but the entire demand can be met by production by small number of farmers. Therefore, these enterprises should be encouraged at the fields of select farmers, who possess the risk bearing ability and entrepreneurial ability to explore and locate the markets/buyers, and who can carefully schedule supplies to match the demand.

For a fairly long time, farmers in the state have been used to produce for assured market, facing little market risk. The producers have to be prepared and trained to produce for market based products. This also imposes heavy responsibility on the state to develop an efficient system of marketing and to develop commodity specific marketing infrastructure.

Despite lot of interest and discussion on diversification, no serious efforts have been made to identify and encourage area specific activities. General type recommendations are being made for whole of the state. There is a need to identify area specific enterprises taking into account the groundwater status, soil health and other micro characteristics of different regions. This way, specialisation pockets should be developed rather than emphasising many things for each area. The advantages of developing specialisation pockets are: (i) these are useful in harnessing advantages of scale economy and (ii) it is easy and less costly to develop infrastructure to boost one or a few rather than many commodities.

The two aspects which need immediate attention and which are vital for long-term growth are (i) public investment in agriculture and (ii) R and D in agriculture. Two decades ago, Punjab invested about Rs 319 crore annually or Rs 768 per hectare (at 1980/81 prices) for agricultural infrastructure which is one of the contributing factor for high growth of agricultural output during the 1980s.[10] As can be seen from Table 9, public investment in the state plummeted to Rs 365 per hectare during the late 1980s. Expenditure on public investment in real terms has declined at the rate of 2.65 per cent per annum during the past two decades which is highest among all the major states. As a consequence of sharp decline in public investment in the state, the infrastructure like rural roads and markets are in bad state. It may sound incredible that lot of paddy crop in the state markets this year has been spoiled by rains, causing huge losses to the farmers because proper market yards for keeping the produce were not available in most of the markets. In order to create favourable condition for long-term growth, the state should step up public investment for improvement in agricultural infrastructure.

The second aspect relates to technology. Though it is acknowledged that the potential of existing technology has been almost exhausted, the state agricultural university, which has a glorious history of ushering in green revolution in the state, has not been able to develop new technology to break the ceiling of old technology. It is a great challenge to the agricultural scientists of PAU to harness the potential of much talked bio-technological techniques and evolve new crop strains and varieties to meet the twin challenges of growth and sustainability.

The R and D in the state has focused mainly on wheat and paddy. Efforts should now shift to new and emerging crops and enterprises of future importance. Establishment of agro-based industries of small and medium size in rural areas away from urban places can be of great help in creating employment for rural youths and to encourage diversification.

Due to high level of crop intensity and high proportion of net sown area in geographic area, changes in crop pattern can ease the strain on water resources to a limited extent. Simultaneous efforts are needed to accumulate the small savings in water wherever possible The possible measures through which demand for water can be reduced are (i) proper pricing of water resources to put a check on indiscriminate and excessive use of irrigation water, (ii) creating awareness among the farmers about the long-run repercussions of depletion of water-table, (iii) research on crops/varieties and water management techniques which can result in water saving, (iv) check on paddy transplanting during the month of May and early June, (v) adjustments in cropping pattern, (vi) incentive for use of irrigation devices like drip and sprinkler, etc, (vii) augmenting supply sources, (viii) discourage cultivation of crops like sunflower which are grown during peak summer, and (ix) confining sugarcane production only to those areas where symptoms of negative water balance are not there.

Dairying is the best choice for agricultural diversification in the state, on

ecological as well as economic grounds. It has vast potential for growth in employment and income and for restoring soil health. Efficient and modern system of marketing and processing is required to give boost to dairy industry in the state.

Notes

[Large part of the paper is drawn from the study *Potentials and Prospects of Agricultural Diversification in Punjab*, Institute of Economic Growth, Delhi, March 1996, computer-script]

1 Refer to the agenda paper, 'Punjab Agriculture 2020: Farmers and Farming in Punjab', Punjab Agricultural University, Ludhiana, October, 1998.

2 As per the prevalent practice in our sample and in most of the rural Punjab, dairy unit consists of in-milk and dry buffaloes and crossbred cows and some young stock Expansion of dairy activity implies expansion of all these animals and not in-milk animals alone.

3 According to an estimate of department of economics, PAU, Ludhiana, number of migrant labour in agriculture is about 12 lakh, which corresponds to 1 worker for every 5 workers in the state.

4 On the contrary, Punjab farmers prefer labour saving technologies because sufficient labour at reasonable wage rate is not available for crop production operations despite the flux of migrant labour from outside states to Punjab.

5 According to a PAU study ratios of straw to grains vary from 0.50 to 1 97 for different varieties. For a conservative estimate we have used the lower ratio

6 The price paid for straw by the industries is so low that only few farmers around the factory location find it economic to transport and sell the produce.

7 Discussions with the agricultural experts reveal that most of the increase in GCA has gone to wheat and paddy directly, while, remaining increase in GCA has resulted in expansion of wheat and paddy area indirectly through crop shifts.

8 Encouragement by the agriculture department to grow crops like sunflower gives the signal to farmers as if water scarcity is not a serious problem in the state

9 As per the available statistics flower production is taken only on 159 hectares area in Punjab and on 29,430 hectares in India (*Economic Times*, March 25, 1996, p 12) which constitute only 0.002 and 0.016 per cent of the total cropped area, respectively.

Transitions in Rice Production Systems in Eastern India

Evidence from Two Villages in Uttar Pradesh

Vishwa Ballabh
Sushil Pandey

Despite the dynamism shown by the agricultural sector as a whole the performance of eastern India which is characterised by rain-fed agriculture has remained somewhat dismal. This study attempts to shed some light on the nature of economic and institutional changes occurring in rice production systems of two villages in eastern Uttar Pradesh over the last 15 years. An overarching question the study explores is whether eastern UP's agrarian relations characterised as being semi-feudal permit expansion of production through the rise of new institutions and spread of knowledge.

THE agricultural sector of India has been undergoing rapid changes, especially in recent years, as a result of improved technologies, investment in infrastructures and policy support. Between 1980-83 and 1992-95, the agricultural output grew at the rate of 3.4 per cent per annum while the population grew at 2 per cent per year. Although rice and wheat have dominated the agricultural production in India both in terms of their share in area as well as in the value of production, recent patterns show increasing diversification to oilseeds and other non-food crops.

Despite the dynamism shown by agricultural sector as a whole, the performance of eastern India which is characterised by rainfed agriculture has remained somewhat dismal. West Bengal and parts of Uttar Pradesh where irrigation investment has expanded in recent years have shown an impressive increase in the productivity of rice and wheat while the productivity growth in other states in eastern India has remained more or less stagnant (Table 1). The total factor productivity in rice production in eastern India increased at the rate of 0.36 per cent per annum during 1972-89 as compared to the rate of increase of 0.76 per cent per annum for the southern region [Kumar and Rosegrant 1995].

Although the impact of green revolution in eastern India as a whole has been somewhat limited, there are areas and regions where productivity growth has been faster than in others. In a recent analysis of performance of agriculture in India, Bhalla and Singh (1997) examined the differential patterns of change in agriculture across different states of India. A major finding from their study is that in eastern India, the share of wheat and oilseeds has expanded at the cost of coarse cereals and pulses whereas the share of other crops, especially that of rice, has remained more or less constant. Overall, the cropping intensity and the productivity of labour has increased over time. An earlier district-level analysis conducted by Bhalla and Tyagi (1989) reported a similar finding.

State and district level analyses, while useful in studying general patterns of changes in agricultural sector, tend to mask differential patterns of growth across areas with varying environments and resource bases. Such analyses do not permit an in-depth study of the changes in the structure of rural economy and the evolution of production relationships that occur in a dynamic setting. The objective in this paper is to shed some light on the nature of economic and institutional changes occurring in rice production systems of two villages from eastern UP over the last 15 years. Before we decided to revisit these two villages, an overarching question was whether eastern UP's agrarian relations characterised as being semi-feudal permit expansion of production through the rise of new institutions and spread of technology. The results reported here form a part of a more comprehensive study of the changes in rice production systems of eastern India.

The villages selected for the study are Ecauna in Deoria district and Tewari-ka-Tarkulawa in Maharajganj district of eastern Uttar Pradesh. Rice production systems in the flood-prone village Ecauna and the flood-free village Tewari-ka-Tarkulawa were earlier studied in 1982 [Ballabh 1983]. These villages were revisited in 1996 to document major changes in production systems and production relations that have occurred during the past 14-year period. Although a formal survey approach was used in 1982, we employed key-informant surveys, focus group discussions and rapid rural appraisal methods to collect information in 1996. Several of the informants in 1996 were farmers surveyed in 1982. This information base was complemented by secondary data available from village and district agricultural offices.

Study Villages

Salient features of the study villages are given in Table 2. The flood-prone village Ecauna is located in the Rudrapur block of the Deoria district. It is located in the western part of the delta created by the rivers Rapti and Garra. The village is inhabited by 352 households with brahmins being dominant (35 per cent). The construction of an embankment along the river Rapti for flood control in 1986 has converted this erstwhile flood-prone village to essentially a flood-free village. Although overall transportation and communication facilities within the village have improved, the absence of bridges over the Rapti and the Garra rivers makes travel by boat hazardous in the rainy season when these rivers are swollen with monsoon rains. The flood-free village, Tewari-ka-Tarkulawa is located along the Gorakhpur-Maharajganj road. More than half of 225 households of the village are Muslim. The village is accessible all-year round, with buses between Gorakhpur and Maharajganj passing through the village.

Agroclimatically, both villages are part of the same region except that Ecauna experienced several floods before the construction of the embankment. The average annual rainfall in the area is 1,200 mm, with more than 90 per cent being received from July to October. The soil texture in Ecauna varies from sandy loam to loam, whereas in Tewari-ka-Tarkulawa, it is loamy to clay loam. The average size of the operational holding is smaller in Tewari-ka-Tarkulawa than in Ecauna. In 1982, the average sizes of the operational holding in Tewari-ka-Tarkulawa and

Ecauna were 2 and 2.8 ha, respectively. The operational holdings have become smaller in 1996 due to an increase in population pressure. Remittance is a major source of cash income in both villages.

A district-level analysis done as a part of the 1982 study indicated that both the level and rates of adoption of HYV rice were higher in flood-free districts than in flood-prone districts. However, the spread of HYV of wheat was not affected by the flood-proneness of the village as it is grown in the dry season. Overall, the adoption of HYV wheat occurred at a much faster rate than that of rice [Ballabh and Sharma 1987] illustrating the importance of climatic risk in determining the rate of diffusion of HYVs.

Due to flood-proneness, Ecauna had a lower cropping intensity than Tewari-ka-Tarkulawa in 1982. The cropping intensity in Ecauna increased from 1.6 in 1982 to 1.74 in 1996 mainly as a result of reduction of fallow area in the kharif (rainy) season. The extent of kharif fallow in Ecauna was over 40 per cent in 1982. Not only has this fallow area declined to 30 per cent but the fallowing practice has also changed. Previously, farmers used to follow a practice called the 'block fallowing' where land owned by several farmers in a particular area used to be fallowed. The decision on which block to fallow in a particular year used to be communal. As the extent of land fragmentation was high (6-20 parcels per farm), these block fallows included land operated by almost every households in the village. In addition to allowing the land to 'rest', these 'block fallows' served as the communal grazing area. Consolidation of land holdings in mid-1980s has reduced the extent of fragmentation (1-6 parcels per farm) and made the practice of block fallowing unviable as land holdings are now more concentrated spatially. The need for block fallows as communal grazing grounds also declined as the net availability of fodder has increased. The fallow land is now scattered all over the village instead of being concentrated in a 'block'.

An important change in the cropping pattern in Ecauna is the reduced importance of mixed cropping. In addition to rice/maize mixed cropping which occupied almost one-third of the net sown area in the kharif season, other common crop mixtures were rice/millet/maize/pigeonpea/fibre-crops and rice/millet/pigeonpea/pearlmillet. Mixed cropping used to be an internal risk management strategy of farmers to cope with flood risk as the crops in the mixture were chosen for their differences in phenology and susceptibility to flood. The construction of embankment to prevent flooding eliminated this risk. As a result, mixed cropping is now fast becoming part of the village history. Instead of mixed cropping, sole cropping is now more popular. In addition, the area under cash crops such as vegetables, sugarcane and fodder has expanded (Table 3).

The area under sole crop of rice increased from about 20 per cent in 1982 to about 28 per cent in 1996 – an increase of 8 percentage points. The expansion is accounted for by local varieties grown under rainfed conditions. The adoption of HYV has remained more or less constant. Thus, elimination of flood risk has not encouraged the adoption of HYV of rice indicating that there are other dominant constraints to adoption.

In the rabi (dry) season also, the extent of mixed cropping appears to have declined. The area under sole cropped HYV wheat as well as under mustard, pigeonpea, lentil and potatoes has expanded. Overall, rabi cropping seemed to be more diversified in 1996 than in 1982. Commercial production of vegetable crops is also becoming increasingly popular.

A different pattern of change can be observed in Tewari-ka-Tarkulawa which, historically, has been a more accessible and flood-free village. The cropping intensity increased only marginally from 1.95 to 2. The cropping pattern here gives an impression of increasing specialisation towards the rice-wheat system. The area under HYV of rice has expanded dramatically with the local varieties more or less disappearing from the village. The kharif fallow completely disappeared in 1996 although it was of marginal significance in 1982. In the rabi season, the area under wheat and lentil expanded at the cost of area under sugarcane and fodder.

The comparative study of changes in cropping patterns indicates that kharif cropping in Ecauna is becoming less diversified with mixed cropping being re-

TABLE 1: GROWTH IN RICE PRODUCTION AND PRODUCTIVITY IN EASTERN INDIA, BY STATES, 1970-91

States	Rice Growth (Per Cent Per Year)			Population Growth	
	Area	Yield	Production	Rural	Total
Assam	0.94	0.92	1.86	na	2.1
West Bengal	0.45	2.27	2.72	2.1	2.2
Bihar	0.04	1.55	1.59	1.8	2.1
Orissa	-0.34	1.88	1.54	1.4	1.8
Madhya Pradesh	0.62	1.68	2.30	1.5	2.4
Uttar Pradesh	1.03	4.28	5.31	1.9	2.1
Eastern India	0.44	2.27	2.71	1.84	2.2

Note. The growth rates are obtained by estimating semi-logarithmic trend lines on the time series data.

TABLE 2: SALIENT FEATURES OF STUDY VILLAGES

Particulars	Ecauna (Rudrapur Block, Deoria District)	Tewari-ka-Tarkulawa (Partawal Block, Maharajganj District)
1 Population (1991)	2165	1430
2 No of voters	>1800	>1000
3 Total HH	352	225
4 Caste composition of households		
Brahmins	120	1
Yadav	60	16
Scheduled caste	100	18
Muslims	3	130
Others	69	60
5 Distance from district headquarter (km)	21	20
6 Minimum distance for pitched road (km)	9	0
7 Nearest market (km)	13-15	6
8 Nearest bank (km)	2[a]	0.5
9 Nearest seed and fertiliser store	2	0.5
10 Village amenities	Police station, telephone one primary school and post office	Three primary schools, (including two arabic and urdu teaching schools), Post office
11 No of tractors	8	8
12 Means of irrigation	Diesel pumpset and borewells	Canal, diesel pumpsets, borewells
(a) No diesel sets	53 (12)[b]	30 (10)
(b) No of borewells	>120 (27)	>60 (20)

Notes: a The nearest commercial bank is located 2 km away from the village. However, farmers have to travel 15 km for credit facilities. Since the village does not come under the jurisdiction of the bank located near the village.
b Figure in brackets refers to number of diesel sets and borewells 1981-82.
Source: Collected from village records

placed by sole cropping while in the rabi season, diversification appears to be increasing. There has also been a shift from low value crops such as millets and barley to higher value crops like rice, wheat and lentil. Small-scale commercial production of vegetable crops also seems to have started. In Tewari-ka-Tarkulawa, the dominant rice-wheat system has further expanded resulting in reduced diversification of cropping pattern. Thus, elimination of flood risk in Ecauna has expanded the cropping options available to farmers who are trying out different crops depending on suitability to soil conditions and marketing possibilities. The cropping pattern there still appears to be in a state of dynamic disequilibrium. On the other hand, the direction of change in Tewari-ka-Tarkulawa has been towards a greater specialisation in the historically profitable rice-wheat system.

Input Use and Yield

Data on yield and input use for rice and wheat are provided in Table 4. The yield of rice has increased in both villages. In Ecauna, the yield of local varieties has increased by 50 to 70 per cent while that of the improved varieties has more than doubled. The yield improvement has been the result not only of varietal change but also of increased use of chemical fertilisers and irrigation. It is interesting to note that not only are the modern varieties grown now somewhat different from those in 1982 but some of the traditional varieties have also been replaced by other traditional varieties. In Tewari-ka-Tarkulawa, traditional and early modern varieties have been replaced by popular Saryu-52 which occupies over 70 per cent of rice area. The yield of modern varieties has more than doubled during the last 15 years. Overall, input usage and average yeild of rice are higher in Tewari-ka-Tarkulawa than in Ecauna.

The picture for wheat is similar to that for rice. In Ecauna, wheat is no longer grown without irrigation. When over 50 per cent of area under wheat was rainfed in Ecauna in 1982, the average yield was lower than in Tewari-ka-Tarkulawa where wheat was mostly irrigated. With the expansion of irrigated wheat in Ecauna, the average yield and input usage for wheat in both villages are now similar. This points towards the homogenising influence of irrigation, especially in the dry season.

Factors of Change

The elimination of flood risk after the construction of the embankment, land consolidation and the expansion of irrigation are the prime factors contributing to changes in rice production systems in the study villages, particularly in Ecauna. Construction of embankment and land consolidation created suitable conditions for exploiting the productive potential of land. This in turn stimulated private investments in irrigation. As a result, irrigated area in Ecauna increased from 20 per cent of the net cultivated area in 1982 [Ballabh 1983] to almost 70 per cent of the net cultivated area in 1996. Except for the private land kept for grazing purposes, most areas now have access to irrigation. Many farmers have invested in several borewells and some even have more than one diesel pumpset. The number of diesel pumpsets and borewells have increased from 12 and 27, respectively in 1982 to 53 and 120, respectively in 1996 (Table 5). This expansion of irrigation is not limited to Ecauna but is widespread in the Rudrapur block as a whole and in other areas in the region. The number of diesel pumpsets in the Rudrapur block increased from 1,000 in 1984 to nearly 4,000 in 1995. There has been a massive increase in investment in diesel pumpsets and borewells in eastern Uttar Pradesh since 1988. Each year since 1988, farmers invested on an average of 3,800 pumpsets in Gorakhpur, 2,300 in Maharajganj and over 5,500 in Deoria and Padrona districts combined [Shah 1996].

The expansion of investment in irrigation resulted from an active promotion of tubewell programme by the government as well as by an increase in private investments made by farmers. Most of these private investments is financed through remittances. The government encouraged investment through subsidised loans for pumps as well as by the free-boring schemes. Between 1984-88, total amount spent on free-boring schemes in Uttar Pradesh was Rs 1.1 billion of which nearly 45 per cent was spent in eastern Uttar Pradesh [Pant 1992, p 62]. According to the branch offices of the State Bank of India located near the study villages, an average village in Maharajganj, Deoria and Gorkhpur districts receives about Rs 4-5 million in remittances annually. This flow of capital would have certainly helped relax the capital constraints for investment in irrigation. Along with the expansion of investment in irrigation, the emergence of groundwater market in the area facilitated improved access to water even for smallholders for whom investment in groundwater is economically unviable [Pant 1992, Shah 1996]. The investment in diesel pumpsets and borewells and development of groundwater markets in Ecauna and Tewari-ka-Tarkulawa are, therefore, part of the larger development process which started in eastern Uttar Pradesh during the last 8-10 years.

The consolidation of land holding also played an important role in encouraging investment in irrigation in eastern Uttar Pradesh [Hanumantha Rao 1994]. Historically, eastern India has had a greater degree of land fragmentation than other regions of India [Ballabh and Walker 1986, 1992]. A land consolidation programme was launched to reduce the inefficiency associated with highly fragmented holdings. The land consolidation programme in Uttar Pradesh has been successful in achieving its objectives [Ballabh and

Walker 1992]. Among the study villages, consolidation was completed in 1974 in Tewari-ka-Tarkulawa and in 1987 in Ecauna. In principle, a competitive water market could be a substitute for land *consolidation as far as profitability of investment in irrigation is concerned. However, an efficient water market cannot emerge without irrigation investment by a large number of potential 'sellers'.* Land consolidation in Uttar Pradesh played a critical role in encouraging the initial investment which later spurred the emergence of water market. In addition, land consolidation may have reduced other inefficiencies associated with highly fragmented holdings.

TRANSITIONS IN RURAL INSTITUTIONS

As predicted by the theory of induced institutional innovation [Hayami and Ruttan 1985], the emergence of new opportunities for increasing productivity and income through a change in cropping pattern and/or through technological change induces changes in the way agricultural production is organised. The production relationships among various factors of productions change to facilitate exploitation of new opportunities. Old institutional arrangements that are no longer relevant are discarded, some are adapted and modified, and new arrangements are developed. In agricultural societies, institutional arrangements regarding the use of land and labour are the most important. Here, we examine the changes in land and labour markets that have occurred in the study villages.

In Ecauna, the proportion of land under sharecropping fell from 45 per cent in 1982 to 30 per cent in 1996. There was a corresponding increase in the area under owner-cultivation. The fixed-rent tenancy arrangement which was non-existent in 1982 has now evolved in Ecauna albeit at smaller scale and only for commercial vegetable crops, particularly, parval. In Tewari-ka-Tarkulawa where share cropping was of marginal importance in 1982, the proportionate area sharecropped has remained more or less constant although there appears to be some shift from fixed rent tenancy to owner-cultivation. Overall, the area operated under owner-cultivation arrangement has increased and now covers more than 70 per cent of the net cultivated area (Table 6). The historical dominance of the owner-cultivation system in densely populated areas has been attributed by various authors to a lower transaction costs associated with this system as compared to other alternative arrangements [Netting 1993, Otsuka and Hayami 1986]. The increased incidence of owner- cultivation in recent years in India is the result of factors such as the eviction of tenants by the landlords [Bhalla and Chadha 1981] and the *conversion of households with very small operational holdings to the landless* category [Chadha 1994].

There are several factors that determine the nature of tenancy arrangements in different societies [Otsuka and Hayami 1986; Otsuka et al 1992]. While economic factors such as cost of enforcement and extent of risk sharing determine the most efficient method in a particular situation, legal and institutional restrictions limit the choices available. When the cost of monitoring and enforcing a sharecropping contract is high, as in the case of the absentee landlords, fixed-rent system tends to dominate. Sharecropping systems are important when cost of enforcement is low and when there are substantial risk-sharing benefits. To the extent that sharecropping is a device to share production risk, the elimination of flood risk in Ecauna after the construction of the embankment may have reduced the need for sharecropping. The fact that the sharecropping arrangement has historically been of marginal importance in the more stable environment of Tewari-ka-Tarkulawa lends support to this hypothesis. Our observations in Ecauna are in conformity with the view proposed by Otsuka et al (1992) that sharecropping is no less efficient than owner -cultivation when landowners are able to monitor tenant's work effort. As hypothesised by Otsuka et al (1992), monitoring of tenant's work effort must be easier in Ecauna where most landowners and tenants live in the same community in comparison to that in Tewari-ka-Tarkulawa. On the other h[a] the absentee landlords in Tewari-Tarkulawa may have been able to red[uce] the monitoring cost by using a fixed-[rent] system. The permanent attached lab[our] system has been abandoned in b[oth] *villages. Otsuka et al (1992) have hyp[o]thesised that permanent attached labo[ur] system emerged in India due to* (a) a rig[id] caste system and (b) agrarian reform law which made tenancy too risky fo[r] landowners. These hypotheses while usefu[l] in explaining the prevalence of permanen[t] attached labour in India in comparison t[o] south-east Asia, do not fully account fo[r] the role of labour demand and suppl[y]

Phosphorus (kg/ha)	35	50	60	60
Irrigation (Number)	1	1-3	2-3	2-3

Notes: a In 1981-82, kharif crops were seriously damaged by floods. The yields reported are average expected yield during that period. b Yield is subject to large fluctuations, for example, farmers reported that yield was almost half during 1994-95 due to drought. c For HYV rice variety. d In addition, farmers applied on an average 28-35 (kg/ha) phosphorus. e Continuous irrigation and 3-10 cm water depth maintained in rice fields during growth phase. f Yield under unirrigated condition was about 16 qt/ha.

factors in determining the nature of labour contract. For example, when the opportunity cost of tenant labour increases as a result of agricultural intensification or due to increased availability of non-farm employment opportunities, fewer labourers may be willing to enter into permanent attached labour contract. The overall tightening up of labour market in the study villages appears to be one of the reasons for the disappearance of this type of labour contract. During the intervening 14-year period, the real wage rates have increased by 50-200 per cent of their value in 1982 (Table 7). Wage payments are now mostly in money rather than in kind.

There also appears to have been some shift in the way hired labour is contracted. In 1982, most of the hired labour used to be paid on a daily-wage basis except for harvesting labour in Tewari-ka-Tarkulawa (Table 7). There has now been a general shift towards piece-rate contracts. For example, transplanting is done mostly by contract labour, with the contract rate based on the area transplanted. While the piece-rate contract for transplanting reduces the landowners' cost of organising and supervising labour as compared to that for daily-wage labour, such a contract also reduces the incentives for labourers to do a more careful and precise job. Transplanters paid on piece-rate basis tend to reduce the trans planting density in order to complete the job fast. In fact, such quality deterioration in the face of tight labour market has been an important factor leading to a switch from manual transplanting to direct seeding in Malaysia or to mechanical transplanting in east Asian countries.

The system of daily wage contract for weeding has remained unchanged. Removing weeds without damaging rice requires a greater degree of precision on the part of the weeding labour. As opposed to transplanting which needs to be completed within a narrow time window, weeding can be somewhat staggered. In addition, the need for weeding depends on the extent of infestation that varies from season to season and from field to field. Hence, unlike with transplanting, the peak-labour demand problem associated with weeding is not so pronounced. From the point-of-view of landowners, the daily wage contract is, hence, superior to a piece-rate contract for weeding. Even in rice-growing areas with very tight labour market, manual weeding is done almost invariably on a daily wage basis. On the other hand, the spraying of herbicides, which does not require much judgment, is done almost invariably through piece-rate contracts.

The harvesting contract in Tewari-ka-Tarkulawa is on crop-share basis for both rice and wheat and has remained unchanged. On the contrary, the daily wage contract for harvesting of rice in Ecauna has remained unchanged but for wheat, the contract system has changed from daily to area (piece rate) basis. Why has the nature of contract in Ecauna changed for wheat but not for rice? A careful study of the labour and demand supply situations as well as that of the ease of contract enforcement is needed to answer this question satisfactorily. Here, we merely propose a hypothesis that a higher degree of field-to-field yield variability of rice as compared to that of wheat may have made the stipulation of labour earning for piece-rate contract for rice more difficult.

Concluding Remarks

The slow growth of agricultural production in eastern India continues to be a cause for concern. The feudal production relations characterised by large landowners exploiting small farmers and landless labourers through narrowly-specified rigid contractual arrangements have often been considered to be the root cause of sluggishness in agricultural performance in the region. The general perception of the Indian rural labour market, particularly in eastern India, has been that of an oligopsonistic market with large and rich farmers fixing wages and using interlinked credit and land market to their advantage [Bhaduri 1977, Bardhan and Rudra 1986, Bardhan 1988]. Mencher, for example, writes "*In areas such as Bihar and eastern Uttar Pradesh, landowners still derive their power from traditional sources and are still exploiting labourers in the same ways as they always did*" [Mencher 1988:544, emphasis added].

The changes that have occurred in the study villages over the past 14 years reflect the dynamism of agricultural sector in rural eastern India that has resulted from improved infrastructure, rising opportunity cost of farm labour and a greater interaction of the rural sector with the market economy. A similar dynamism was shown earlier by states such as Punjab and Haryana where the green revolution led to a rapid change in agricultural sector. Due to predominantly rainfed nature of agriculture in eastern India, the pace of change has been obviously slower than in Punjab and Haryana. But increased private and public investment in irrigation of recent years will certainly help accelerate changes in agricultural production systems as indicated by the study villages.

The new opportunities for increasing farm productivity and incomes have led not only to changes in crop choice and input usage but also have induced changes in land and labour markets. The evidences presented from the two villages do not corroborate the stereotypic and stylised picture of exploitative land and labour market in eastern Uttar Pradesh. Real wages have increased over time and the labour market has tightened as employment opportunities both within and outside the village have expanded. It is not easy for

Notes: a The employer gave one acre of land to employee for self cultivation, breakfast and sometimes lunch for working 8-10 hrs/day for 6-1/2 months. The employee (labourer) was entitled to cultivate land for both kharif and rabi seasons. b For working as a farm manager. c Figures in parentheses indicate the wages rate. d Crop is shared between land owners and harvesters in 12:1 ratio.

landowners to unilaterally stipulate conditions of labour contract as the bargaining power of labour has increased with the rise in the opportunity cost of labour. As agriculture is further intensified in these villages and off-farm and non-farm opportunities expand, the nature of land and labour markets is bound to be determined much more by market forces than by the social and communal factors. Innovative technological, policy and institutional interventions to exploit and encourage rural dynamism are needed to guide the process of economic growth.

Impact of Irrigation Management Transfer in Maharashtra

An Assessment

Niranjan Pant

On the basis of available sparse data,this paper finds the functioning of water users' associations (WUAs) in Maharashtra beneficial on various fronts. Not only have the WUAs increased their irrigated area but also the water use efficiency has been found to be higher after the irrigation management was transferred to the members of WUAs. The WUAs have considerably improved the recovery of water charges thereby bringing revenue to the government. Moreover, the WUAs, by charging much higher amount from their water users, have accumulated funds for the maintenance of their micro structures and continue to survive and thrive even after management subsidy of the government has ceased to exist.

DURING the last two decades, the concept of participatory irrigation management (PIM) in India has passed through three distinct phases. Starting from around 1975 and for about a decade until 1985, the emphasis initially was on creating outlet based water users' organisations and later on research leading to support for PIM as a pragmatic solution for equitable distribution of water among the irrigators, maintenance of water conveyance, micro structures and resolution of conflicts amongst the water users arising out of these. As a result, the government's strategy for CAD included, from the start, farmers' organisations as necessary to run the micro-system [GOI 1977]. The major research funding for this purpose during this period was provided by the Ford Foundation, New Delhi. During the second phase (1985-90), the emphasis shifted from research on PIM to experimentation with PIM. Therefore, a number of pilot projects were started and developed all over the country during this period. Ministry of Water Resources (MOWR), GOI, World Bank and USAID aided and assisted in the establishments of pilot projects, while NGOs played a catalytic role in mobilising farmers and sustaining the pilots. The third phase starting from early 1990s has seen the emergence and propagation of the idea of hand over/turnover of irrigation systems in case of smaller systems and hand over of management of sub-systems, particularly at the level of distributories/minors in case of larger systems to the irrigating farmers. Encouraged and aided by the GOI, state governments and NGOs are playing a pivotal role in this phase.

Evolution in Maharashtra

The precursor of the present day irrigation co-operatives in Maharashtra was M Visvesvarya, the doyen of civil engineering in India, who as early as 1902-03 had suggested the establishment of such co-operatives in respect of Khadakwasla canals while working as an assistant engineer in the Bombay state. Later the same ideas found place in the report of the Irrigation Inquiry Committee (1938) where he was the chairman. The committee suggested establishment of water panchayats. These panchayats were to be chosen by the irrigators of all the villages of the then ten mile section. Sale of water on volumetric basis was also recommended to check the wastage of water [SOPECOM 1997].

In recent times in 1984, the irrigation department formulated the 'Outlet Committee Rules 1984'. Under these rules, for every outlet, a committee of five members was to be formed It was envisaged that an outlet would irrigate the area of 15 farmers. There was supposed to be a leader for each committee, and leaders of every beat formed 'a group of irrigators'. This group was to elect a panch for the water panchayat committee [Lele and Patil 1994].[1]

In October 1985, MOWR, GOI, asked all the state governments to select one minor in each CAD project as a pilot for farmer participation. Elaborate guidelines were issued, indicating the time periods for each activity and provision of 50 per cent matching grant from GOI. Consequently, in Maharashtra, pilot schemes were initiated in Khadakwasla and Jayakwadi projects. Side by side, two action research programmes were also launched in close collaboration with NGOs in Mula and Waghad irrigation projects in 1988 and 1990. These programmes especially aimed at evolving strategies, methodologies and approaches in motivating and organising the farmers and identifying the training needs of farmers and the irrigation staff. In reality, the action programmes were very useful in formulating the guidelines on PIM [Lele 1998].

Encouraged by the then leadership of irrigation department, the state of Maharashtra launched the programme of establishing water users' co-operatives and strode past other states in respect of the progress. This was evident during the national seminars on PIM at WALMI, Aurangabad in June 1994. The national seminar in Maharashtra was preceded by the state level workshop held in February 1994 where the obstacles pertaining to PIM were discussed at great length and ways and means to resolve them were mooted. Maharashtra's pre-eminence among the other Indian states was again visible in the national seminars held at New Delhi during June 1995 and January 1997.

The Scenario

In judging the impact of irrigation management transfer (IMT) in Maharashtra, it is necessary to see the context of the state generally and more particularly in relation to agricultural scenario. Maharashtra is the third largest state both in terms of population and the area. It's population of 78.9 million (1991 Census) and area of 307.7 thousand sq kms both contribute 9.3 per cent each in India's population and area. It compares favourably to India's average with respect to literacy and urban population. In Maharashtra, there are 65 per cent literates compared to India's average of 52 per cent. Again, 39 per cent of its population dwells in urban areas compared to 26 per cent in rest of the India. The life expectancy of its female is 62 years and for the males 60 years, while the same at the all-India level is 56 years for males as well as females.

Maharashtra contains about 8 per cent of India's total land holding and about

13 per cent of the holding area. This is reflected in Maharashtra's relatively larger average holding size (2.64 ha compared to India's 1.69 ha). The gross cropped area in Maharashtra is 21.8 million ha which constitutes 11.8 per cent of India's 185.5 million cropped area. The cropping intensity in Maharashtra is 120 per cent which means only 20 per cent of the cultivated area is cropped more than once. At all-India level the cropping intensity is 130 per cent. In case of Maharashtra 11.4 per cent of the cropped area is irrigated which falls far short of 33.3 per cent of the cultivated area irrigated at the all-India level. It produces about 11 per cent of India's foodgrains and it ranks third in terms of foodgrain production.

Table 1 provides information about crop production in Maharashtra and the share and ranks of important crops at the all-India level. Cereals, including millets occupy 51 per cent of the cropped and 54 per cent of the irrigated area. Among the individual crops, Jowar (Sorghum) is the most important crop in Maharashtra. It occupies 29 per cent of the cropped area and 17 per cent of the irrigated area. It's share in India's total sorghum production is 45 per cent and the state ranks first in its production. Although it occupies 17 per cent of the irrigated area, irrigated area constitutes only 6 per cent of the cropped area. This means that the major portion of the crop is taken as a rain-fed crop. The other important crops in the state are gram, maize, pearl millet, pulses and oilseeds.

Among the irrigated crops, the most important crops are paddy, sorghum, wheat and sugarcane. Except sorghum, a big chunk of these crops are irrigated and among these crops sugarcane is the most irrigation consuming crop. Although it is cropped in only 20 per cent of the cropped area, it occupies 15 per cent of the irrigated area and 81 per cent cropped area is irrigated. About 12 per cent of India's sugarcane is produced in Maharashtra. The other important crops requiring regular irrigation are wheat, paddy and maize.

It would be interesting to examine Maharashtra's irrigation resources in view of the prevailing agricultural scene. Table 2 shows the gap between irrigation potential created and its utilisation in Maharashtra and India. The total irrigation potential created in Maharashtra up to 1994-95 was 4.75 million ha. This constitutes 5.5 per cent of India's created irrigation potential. An interesting point emerging from the table is that while in case of India, the gap in the utilisation of this potential is 10.6 per cent, in case of Maharashtra this widens to 27.6 per cent. Another interesting point emerging from the table is that this gap is very much higher in respect of major and medium projects. In part B of the table, it is found that while in case of major and medium projects, the gap is 35.8 per cent, in case of minor schemes, it lowers down to 10.2 per cent. However, here also, as in the case of major and medium projects, the gap at the all-India level is lower (3.8 per cent) than Maharashtra.

Table 2: Gap in the Irrigation Potential Created and Its Utilisation through Major, Medium and Minor Irrigation Schemes at the End of 1994-95 (1000 ha) (Provisional)

Part A

	Irrigation Potential Created	Utilised	Gap
States + UTS	87067.01	77854.80	9212.21
Maharashtra	4747.79	3438.85	1309.94

Present Status of IMT

According to the latest information, there are 228 water co-operatives in the state where IMT has taken place. Out of these, 213 (93.4 per cent) are formed in major and medium projects and 15 (6.6 per cent) are formed in minor projects. In terms of their regional distribution, the largest number of 76 water users' associations (WUAs) have been formed in Pune region, followed by 71 in north Maharashtra region and then 63 in Marathwada region. In Vidarbha, consisting of Nagpur and Amravati regions, their total strength is 18. In Konkan region, on account of pressure from the donor agencies, attempt is being made to establish water co-operatives. However, in no case, IMT has been effected so far.

The reasons for the non-establishment of water co-operatives in Konkan region are manifold. Here the holdings are very small, rainfall is very high and the terrain contains a steep slope. There is no diversification of crops and paddy is the main crop which does not require any precise water management. In contrast, in case of Vidarbha region, land holdings are large and old malguzari tanks exist in the area. Since farmers are accustomed to getting free water for centuries, they do not find any attraction in forming WUAs. Further, paddy is the main crop in Vidarbha also. Hence farmers do not find the management subsidy and the rebate in water charges given by the state government attractive enough to come forward to form water users' co-operatives.

Although Marathwada is a backward region like Konkan and Vidarbha, there are a number of irrigation projects funded by the USAID and the World Bank like Jayakwadi and Majalgaon. In all such projects, the donors have insisted on the formation of WUAs. In fact, out of 56 societies where IMT has taken place in Marathwada, 42 were established in Jayakwadi (26) and Majalgaon (16) projects.

In Table 3 status of IMT in Maharashtra, has been presented. Up to May 1998, IMT had taken place in case of 201 societies involving an area of 76,021 ha. In 27 cases involving an area of 9,157 ha, the agreement between the society and the irrigation department was signed but the IMT had not taken place. In 219 cases involving an area of 75,624 ha the societies were registered but agreement had not taken place. In 186 cases involving an area of 66,567 ha the societies had been proposed but registration of the societies had not taken place. This means that there were 432 societies involving an area of 1,51,348 ha which were in various stages of IMT apart from those where IMT has been effected.

One conspicuous feature emerging from the table is that the IMT activities are more prevalent in case of CAD, and major and medium projects than in non-CAD and minor projects. Of the total 201 cases where IMT has taken place, 85.6 per cent are from the major and medium CAD projects, 10.4 per cent are from major and medium non-CAD projects and 4 per cent are from the minor project. The faster pace of IMT in respect of CAD projects is understandable because at the GOI level 50 per cent matching financial commitments are only for CAD projects. To that extent, IMT process is facilitated in CAD projects. In case of non-CAD projects, funding may not be easily available except in case of donor assisted projects.

Key Ingredients of IMT

The following constitute the key elements of IMT in Maharashtra.

(i) Unit of IMT : The primary unit of PIM is at the minor level involving about 200 to 300 farmers covering an area of 300 to 800 ha. The water users' organisation at the minor level is a formal organisation registered as water users' society under the Co-operative Societies Act, 1960 of Maharashtra state [Lele 1998].

(ii) Pre-condition for registration : At least 51 per cent beneficiaries or 51 per cent of the land of the CCA of the minor is the eligibility criterion for the registration of the WUA [GOM 1994].

(iii) Memorandum of understanding (MOU) : It is an agreement between WUA and the irrigation department which specifies rights/responsibilities and functions of the either side.

(iv) Volumetric supply of water: The irrigation department supplies water to the WUA on a volumetric basis. Water quota for each cropping season is fixed, based on a normal year supply, and is entered in the MOU. This ensures equitable water supply in the project command.

(v) Freedom of crops: The WUA has the freedom of growing any crops within the sanctioned quota of water.

(vi) Conjunctive use of water: According to the provisions of the Maharashtra Irrigation Act, 1976, the canal and well water can not be used for the same area. The act envisages a distance of 3 metres between channels that supply irrigation water through the canal system and the channels conveying water from wells. Since WUAs are charged on a volumetric basis, the government does not levy any additional fees on the ground of water exploitation by WUA members.

(vii) Maintenance and repairs: A grant of Rs 20 per ha is given by the irrigation department. In addition, WUAs can charge additional fees or service charges from the water users.

(viii) Incentives for timely payment: An incentive of 5 per cent rebate in water charges is provided for the timely payment of water charges.

(ix) Management support: A 20 per cent discount in water bill to the WUA after management subsidy is discontinued in case of CAD projects[2] and since beginning in case of non-CAD projects.

(x) Provisions in case of surplus/deficit water: Rules for distribution of surplus or deficit water are framed and incorporated in the MOU [Lele 1998].

(xi) Multipurpose co-operative societies: The WUAs are designed to be multipurpose co-operative societies and can undertaken other allied activities which may promote agricultural production and increase incomes of the members [Lele 1998].

Table 3: Status of IMT in Major, Medium and Minor Projects (May 1998)

Project	Number of WUAs

Impact Assessment

The rationale behind IMT is to improve the delivery of services so that better results could be obtained from the management transferred entities. Therefore, an assessment of IMT would hinge on the performance results of the transfer on the crop productivity, profitability, financial viability, equity, water use efficiency and sustainability of IMT. Assessment of the impact of IMT could include the following aspects:

- Reliability and/or adequacy of irrigation service, especially for water delivery, change in irrigable area actually irrigated and system maintenance.
- Effect of cost effectiveness of irrigation management.
- Payment rate of O and M fees before and after IMT.
- Financial viability of the WUA.
- Physical condition of micro structures and the conveyance system before and after IMT.
- Impact of IMT on agricultural productivity (cropping intensities and yields).
- Changes in profitability of irrigated agriculture.
- Effect on access by socio-economically deprived beneficiaries,

Given the extent to which IMT is being implemented in Maharashtra, it is frustrating to find that there is very little information available about the impact of IMT programme on the aspects detailed in the preceding. This is more so when there is a full fledged directorate in Maharashtra to monitor the IMT programmes which regularly collects information on cropwise irrigated area, sanctioned and used water, water charges collection etc. Very little attempt has been made to analyse these data. It remains to be seen whether IMT can simultaneously save money for the government, bring about more cost efficient management for the farmers and achieve financial and infrastructural sustainability. This is not surprising considering the fact that even in an international conference on IMT in Wuhan, China during September 1994, only 25 of the 100 papers contained data on performance outcome of management transfer. Even among these 25 papers, most of them presented only data on performance after transfer, using at most two or three performance measures and only four papers presented before and after comparisons [Vermilion 1997].

This paper attempts to assess the impact of IMT in terms of some of the factors mentioned in detail in the preceding. The paper is based on the author's visit to various IMT sites in Maharashtra during October 7-18, 1998 and the study of the various documents obtained during this visit. The most depressing fact which the author found was that there was hardly any comparable data before and after IMT available in Maharashtra. Thus, what was true of impact studies was also true of availability of data dealing with before IMT period. As a result, whatever data could be collected in respect of impact

assessment is sketchy and partial and the same has been utilised in this paper.

Area, Membership and Duration in IMT

Tables 4A and 4B provide data dealing with 13 and 10 WUAs, respectively. The 13 WUAs covered in Table 4A are drawn from Marathwada region and are established in the World Bank funded Jayakwadi project. The 10 WUAs covered in Table 4B are drawn from the north Maharashtra and Pune regions and are established in Khadakwasla, Mula, Bhima and Kukadi projects.

In respect of Marathwada WUAs (Table 4A), the CCA varies between 186 ha (Ahilya Devi) and 964 ha (Babultar). The average CCA of the 13 WUAs comes to about 369 ha. In case of the 10 WUAs from north Maharashtra and Pune region (Table 4B), the CCA varies between 169 ha (Laxmi Narsimha) and 1,007 ha (Shri Mullika) and the average CCA size comes to about 465 ha. In all WUAs, the ICA is substantially smaller than CCA. The average ICA size for the Marathwada WUAs comes to 311 ha, while the same for the north Maharashtra and Pune WUAs is 316 ha. This means that there is a bigger gap between CCA and ICA in case of the latter compared to the former.

The next important aspect is membership of WUAs. This deals with the proportion of total beneficiaries having membership of the WUAs. In respect of Marathwada, it is found that the membership varies between 46 per cent in case of Shri Samarth Bhogeshwar to 100 per cent in case of Ahilyapur which has the smallest CCA. In respect of north Maharashtra and Pune regions; the membership varies between 53 per cent in case of Mullika and 100 per cent in case of Malganga.

Another aspect important from the point of view of what constitutes beneficiaries of WUAs and their area in the WUA. Here, apart from percentage of members in relation to total land holders, it is also important what proportion of members' land constitutes a WUA. In respect of Marathwada, the proportion varies between 100 per cent in case of Ahilyabai and 40 per cent in case of Dhyaneshwar. In respect of north Maharashtra and Pune regions, the data are available only for 3 WUAs. In two cases (Dhyaneshwar and Datta), the proportion of members' land in relation to the CCA is less than 50 per cent. The minimum eligibility requirement for registration of a WUA in Maharashtra is 51 per cent land of CCA or 51 per cent of members of the total beneficiaries. Looking at the data from this angle, it is found that although all WUAs in Marathwada region fulfil the eligibility requirement, Sri Maharudra just scraps through with 51.5 per cent members and 47 per cent land. In case of north Maharashtra and Pune regions, in all the three cases for which the data is available, the minimum requirement are fulfilled.

It seems the eligibility requirement as decided by the Maharashtra government is not very prudent. There is every possibility that a small proportion of beneficiaries with large land holdings can establish a WUA. This may exclude a majority of marginal poor farmers to reap the benefits which is not a very promising prospect from the stand point of equity and more particularly giving equal shares to socio-economically deprived sections of farmers in a WUA command. Therefore, it would be advisable that Maharashtra government changes the eligibility criterion and amends it to contain 51 per cent CCA land as well as 51 per cent membership.

There is a step between the registration of a WUA and its hand over to farmers and this step is known as the joint inspection of the condition of the sub-system to be handed over to farmers. After this stage, deficiencies are noted and once the system is restored to the designed or operation level by the irrigation department, the same is turned over to the WUA. Tables 4A and 4B also show the time lapse between registration and handing over. The data in respect of Marathwada show that the time varied between almost five years in case of Samartha Bhogeshwar to zero time in case of Renuka. The average time for 13 WUAs, however, comes to about a year.

In respect of north Maharashtra and Pune regions, the time variation is minimum (0.5 year) in case of Audumbar and maximum (3.25 years) in case of Sidheshwar. The average time taken in case of 10 WUAs is about 1.33 years. This means that the time taken in handing over is quite reasonable considering the fact that the

department has to carry out a lot of rehabilitation work in some of the systems to enable them to perform as per design or at least at a practical operation level.

In Table 5, an additional angle in respect of north Maharashtra and Pune regions is the examination of actual crops grown in the commands of WUAs during 1992-93. The table shows the gross area covered by each crop which meant summation of each year crop during the reference period. The data have been provided for five crops, namely, sugarcane, bajra, rice, wheat and jowar. The most glaring point which emerges from the table is that only sugarcane has been grown in more area than proposed and all other crops are grown in less area than proposed. In case of sugarcane, the area coverage is seven times more than the area proposed. On the other hand, paddy is not grown in any of the areas where it was proposed. The other crop which covers much less area than proposed is jowar which is grown only in 15 per cent of the area, it was proposed. In case of wheat, it is grown in 45 per cent of the area, it was proposed to be grown. Only bajra covers an area close to what was proposed because it is grown in 79 per cent of the proposed area.

There are two generalisations which can be drawn from the data. One, sugarcane (being a cash crop) dominates among irrigated crops and the other irrigated crops suffer on account of sugarcane. Even rainfed crops like bajra might be suffering on account of sugarcane leave apart paddy and wheat. Second, the cropping pattern envisaged in the project designs is very unrealistic and is nowhere near what farmers want to grow. The data in Table 5 justifies Maharashtra government's decision to give farmers the freedom to grow whatever crop they want to grow within an allotted quota. The only point of debate however is whether sugarcane should have such a predominance over other irrigated crops, and whether or not government should impose some sanctions over WUAs in this respect?

Irrigation and Water Utilisation

The data relating to IMT is marked by a near absence of information dealing with commands of WUAs prior to IMT. As pointed out in the preceding portion, this paucity of data on similar parameters is a great hurdle in the comparison of WUAs before and after. Keeping this in mind, Tables 6A and 6B have been formed to compare the situation before and after the IMT. Of the 10 WUAs dealt in the Table, 8 were visited by the author and in all these cases the data relating to before the IMT position was specially got collected.

The comparison of water utilisation in the two tables shows that water use in commands of WUAs have generally increased. The only exception in this respect are two WUAs, namely, Malganga and Gurudatt. In case of Malganga, the average water use per year before IMT was 10,901 TCM/year and after IMT it has come down to 6,913 TCM per year. In case of Gurudatta, the average use of water per year was 460 TCM before IMT and it has come down to 333 TCM/year after IMT. However, what is remarkable in respect of Malganga is that the average area irrigated per year has gone up from an average of 169 ha to about 202 ha after the IMT. This means that the society makes better use of per unit of water. This is reflected in the area irrigated per mme (ha) compared to pre IMT position when it was irrigating 77.5 ha per mme, it irrigates about 166 ha per mme which is more than double compared to what the farmers were irrigating before the IMT.

The same, however, is not true in respect of Gurudatta, where reduction in water use has also led to reduction in irrigated area. As a result, the average annual irrigated area in Gurudatta goes down from 79 ha in pre-IMT period to 60 ha during the post-IMT period. What is however significant in respect of Gurudatta is that there is more efficient use of water after the IMT. Before IMT, the area irrigated was 171 ha per mme which goes up to 179 ha per mme in the post-IMT situation.

In terms of average area irrigated per year there are two societies, where area irrigated has gone down after the IMT compared to pre-IMT position. These societies are Sri Ram and Laxmi Narsimha. In case of Sri Ram, the average annual area irrigated has gone down to 52 ha after the IMT compared to 55 ha before the IMT. In case of Laxmi Narsimha, the average annual irrigated area before IMT was 256 ha and it has gone down to 200 ha after the IMT. Although in case of both the societies average annual water use have gone up after the IMT, the increase in case of Laxmi Narsimha is substantial (from 1,455 TCM before to 2,402 TCM after) compared to marginal increase in case of Sri Ram (from 279 TCM before to 286 TCM after). The same is reflected in the area irrigated per mme. In case of Laxmi Narsimha, the area irrigated per mme during post-IMT period comes down to 83.2 compared to 175.9 ha per mme in pre-IMT period. In case of Sri Ram the area irrigated goes down from 205.6 ha per mme during the pre-

Source: S No 1 to 5 IIM, Ahmedabad, December 1995 and Sr No 6 and 7, GOM.

IMT period to 182.5 ha per mme in the post-IMT period. In both these cases, worse water use during the post-IMT period may be on account of increase in the area of crops like sugarcane, wheat and cotton.

In term of use of per unit of water, Shri Hanuman ranks first both before and after the IMT. It irrigates 582 ha per mme of water before IMT and 369 ha per mme after IMT. As regards the ranks of other societies before IMT, the second place goes to Sri Ram, followed by Datta and then Laxmi Narsimha. After the IMT the second place is occupied by Baliraja, followed by Datta and then Sant Dhyaneshwar.

In case of use of water by the WUAs in relation to water sanctioned to them, it is found that only one WUA, i e, Laxmi Narshimha, has taken more water than the quota sanctioned to it. This WUA on an average annually used 2,402 TCM of water against an annual allocation of 2,250 TCM sanctioned to it. The other WUAs which might have annually used more water than the water sanctioned to them are three Ozar based WUAs. Unfortunately here, figures are available for rabi season only. These three WUAs together have used 2,671 TCM of water during Rabi alone which constitutes 59 per cent of the annual sanctioned quota of 4,505 TCM. The doubt arises because during rabi the three societies have marginally exceeded the water use compared to sanctioned quota of water. Another WUA which has used more than sanctioned water during rabi is Laxmi Narsimha which has used 1,106 TCM of water against an annual rabi quota of 860 TCM.

During hot weather two WUAs, namely, Laxmi Narsimha and Datta, have used more than the sanctioned water. Laxmi Narsimha has used 873 TCM of water against the sanctioned hot weather (HW) quota of 620 TCM. Datta has used 455 TCM of water against the sanctioned HW quota of 283 TCM.

Another angle from which the WUAs have been examined is the water charges levied on them by the irrigation department and the recovery made by the department from them. In this respect data has been provided in Table 7 for the 10 Societies. The first thing that strikes in the Table is a very high rate of recovery. Out of 10 WUAs, in case of 6 the recovery is 100 per cent. Only in case of 4 association the recovery varies between 80 per cent and 90 per cent. The overall recovery in case of 10 WUAs is 94.4 per cent. This is a very high rate considering the fact that water rate recovery has been the most depressing feature of irrigation projects all over India. In his study of Kosi irrigation project in Bihar, the author had found that the recovery of water charges was annually averaging at 42 per cent and as a result the actual recovery in terms of arrears was only 7 per cent [Pant 1981]. However, what was significant was that the water charges annually collected were not even sufficient to meet the expenditure involved in the salary, etc, of the collection machinery. Consequently, there was no question of raising money for the maintenance from the water charges.

Given this bleak scenario, it is heartening to find such a good rate of recovery from WUAs in Maharashtra. An interest-

ing feature emerging from the Table is that the largest chunk of recovery comes from hot weather crops (58.6 per cent). Next to hot weather is Rabi crops which contribute 31.8 per cent of the recovery. The lowest proportion of recovery comes from kharif crops (9.6 per cent). It is interesting to note that while HW use of water contributes maximum to the government recovery, in most of the project designs there is hardly any provision of hot weather crops and hence rarely any provision of HW irrigation.

There is a snag in the data presented in Table 7. The data refers to a limited period and it also does not tell the position with respect to previous arrears, if any. The detailed data with respect to Sahajivan, (sr no 2) tells a different story. In respect of this WUA, the IMT had taken place on March 1, 1989. The arrears, in case of this WUA during 1988-89 were totalling Rs 7,904 and at the end of kharif 1996-97, the same had increased to Rs 83,508. This includes the period which is covered in Table 7. It would, therefore, be difficult to point out the ultimate recovery position without the arrears position In case of Sahajivan, it is possible that the recovery is 100 per cent only in respect of current water charges levied during 1992-96.

The biggest nine defaulters in respect of Sahajivan have a total arrears to the tune of Rs 35,000. During the discussions at the site, an interesting point emerged that the biggest defaulters were upper reach farmers, while the punctual payers were farmers in relatively tail locations. Among the nine top defaulter, those who owed 63 per cent of arrears were located at the head. Another 21 per cent of the arrears belonged to those farmers who were located at the middle of the command of the WUA. Finally those who owed the recovery of 16 per cent arrears were located at the tail. Another interesting point relating to nine top defaulters was that the top position was occupied by the ex-chairman who owed Rs 15,000 and fourth position belonged to the present vice-chairman who owed Rs 3,000 to the irrigation department

In fact, in case of Sahajivan, most of the members and the office holders are in favour of disbanding the WUA and had approached the executive engineer with a resolution passed in this respect. However, the irrigation department did not favour the dissolution of the WUA because there were very few WUAs established under irrigation department and the department did not want the dissolution of those WUAs which have been established.[3]

An angle from which WUAs need to be examined is whether or not these associations make profit out of water charges collected from the users? The same aspect has been dealt in Table 8 with respect to seven WUAs. First thing that strikes about the Table is that all the WUAs are making profits out of water charges collected/to be collected from the users. The annual profit varies between Rs 7,407 in case of Sriram and Rs 50,798 in case of Sri Datta. The percentage of profit also varies from the minimum 45.9 per cent in case of Laxmi Narsimha to 126.6 per cent in case of Sri Datta. Thus, both in absolute as well as percentage terms, Sri Datta is making maximum profit out of the water charges assessed/collected from the water users. This is a healthy sign because as long as a WUA makes considerable profit out of water charges, they can maintain the subsystem at a satisfactory level. It would have been interesting to examine the position of water charges collected by the irrigation department before the IMT and the ones collected after the IMT. Unfortunately data in this respect is available only for one WUA, namely, Malganga.

In case of Malganga, data for the water charges is available for three years before IMT (1987-90) and for four years after the IMT (1991-95). The average annual water charges before IMT kharif were Rs 3,388 which go up to Rs 5,536 after IMT registering an increase of 63 per cent. During Rabi the average water charges before IMT were Rs 8,193 which go up to Rs 15,954 after IMT registering an increase of 95 per cent. The average water charges for the hot weather before the IMT were Rs 11,285 which after IMT shot up to Rs 28,388 registering an increase of 152 per cent.

During this period (July 1991 to July 1994), the irrigation department made an increase in the water charges per TCM. The important question however is whether or not the kind of phenomenal increase in the collection of water charges witnessed in Malganga would have been possible without IMT. It seems this kind of increase would not have been possible without IMT. However, before a definite answer could be given to this question, more data in respect of government collection from water charges before and after the IMT is needed.

No doubt the WUAs are making profits from the water charges collected from the users. The more important point is what is the overall position of WUAs in relation to profit/loss. In Table 9, the data relating to seven societies have been presented showing the overall position. Looking at the Table, it is found that out of seven WUAs, three are running in loss while four are making profits from Rs 4,632 (Jay Yogeshwar) to Rs 43,363 (Malganga). This position is not very flattering but it seems the picture in respect of serial Nos 5 to 7 is not a normal one. It is so on two counts. One, we have very limited data for the Ozar based three WUAs. Secondly, the balance sheet provided by the chairman of one of the WUAs showed that each of the WUAs were making good profits during 1991-97 and that their total profit together with grants amounted to Rs 2.31 lakh. However, without grants the three WUAs do make a loss of about Rs 2.1 lakh during 1991-97. The other loss-making WUA is Adumbar. In this case, the ICA seems to be very small compared to other associations. Given the small size of ICA, there is every likelihood that this small size is affecting the working in two ways. On the one hand, per ha income would be meagre and on the other, maintenance and management cost per ha will go up.

So far, the WUAs have been discussed in terms of data obtained either from the irrigation department or from the WUAs themselves. As mentioned in the preceding, the author visited the sites of a number of WUAs during October 7-18 in Maharashtra During these visits the author held detailed discussions with the farmers and office holders of theses WUAs. Apart from these, the author jotted down notes based on his own observation regarding the working of these WUAs. Table 10, thus makes an assessment of the working of WUAs visited by the author. The aspect covered in the Table have not been examined so far.

The first thing which emerges from the table is that, whosoever might have initiated action for the formation of a WUA, the one who runs the show has a direct interest in the benefits emanating from it. This is obvious from the fact that those who run the show have good size of land holding. The only exception in this regard is Veer Savarkar. In this case the secretary no doubt owns very meagre land but is an important leader of farmers' movement and is the secretary of two other societies (Sant Gyaneshwar and Baliraja) having offices in the same premises where Veer Savarkar is located.

In terms of working of the associations, it is found that the majority of the WUAs either maintain their records very well or fairly well. Out of eight associations, only two have very poor maintenance of record. In respect of internal democracy among members, it was found that only one

association was lacking in this trait. Incidentally this happened to be so in case of Malganga which is rated as one of the most successful WUAs in Pune region. Equity in water distribution is high in two associations (25 per cent), medium in four (50 per cent) and low in two (25 per cent).

Thus, judging the WUAs from a rather subjective and not easily quantifiable data, it is found that by and large these associations are working quite satisfactorily.

CONCLUSION

The objective of the paper was to make a rapid assessment of the impact of IMT in Maharashtra. Judging Maharashtra's coverage of area under IMT, it is found to be quite good since already in case of 228 WUAs, irrigation management has been transferred to user farmers. Thus, already an area more than 76,000 ha is outside the domain of irrigation department in matters of management. Given this large extent of area, it will be extremely useful to see the impact of this in relation to a number of parameters already mentioned in the paper. Even if it is not possible to measure the impact in terms of all the valid parameters, it is absolutely essential to see the impact of IMT in terms of some key parameters like water used, area irrigated, water charges collected by the government and total income generated by the command area. All these needs to be examined in terms of a comparison of the position before and after the IMT.

Unfortunately, no serious effort has been made to do this comparison except in an ad hoc manner in case of few WUAs which are cited by every one, time and again. Lele in his conference paper (1998) has summarised the findings of some of the studies carried out by him and his colleagues and IIMI and IIM, Ahmedabad teams. But these again suffer from a lack of pre- and post-IMT comparison.

In such a scenario, the author tried to lay his hands on whatever data he could get to provide some impact assessment. Based on whatever data could be collected, it is found that WUAs have generally increased their irrigated area mostly using less water. Even in such WUAs where more water has been used after the IMT, the per unit water use (water use efficiency) is found to be higher after IMT. On another front, WUAs have done exceedingly well and this relates to the revenue coming to the government from water charges. From the data available to us, it clearly shows that the recovery of water charges has considerably improved after the IMT. At the same time, it is found that the WUAs have been charging a much higher amount from their water users. This is a good sign because this will enable the associations to accumulate funds for the maintenance of micro structures relating to conveyance of water at the WUA level.

Another redeeming feature of WUAs is that a majority of WUAs are running in profit. Initially these associations may be doing so on account of management subsidy. However, even such organisations which have been working for over three years and where management subsidy has ceased to exist are running in profit.

Although the assessment made in this paper is not based on wide ranging data, the picture does show WUAs in a favourable light. However, to arrive at a conclusive manner, more focused analysis is needed with respect to the position before and after the IMT in respect of WUAs which have completed at least four-five years after the IMT. It is felt that lead in this respect needs to be taken by the directorate of irrigation research and development, Pune, by doing an analysis of about 10 per cent of the 214 WUAs selected on a stratified random basis. This exercise will go a long way in understanding the impact of the IMT in Maharashtra.

Notes

[I wish to express my gratitude to V W Ambekar, retd director, Agriculture, UP for translating the Marathi terms into English and other suggestions.]

1 The government of Bombay state framed rules in 1947 for the formation of water panchayats. These panchayats were envisaged as intermediaries between the irrigators and the department with some executive functions.

2 In CAD projects a management subsidy is given by GOI to WUAs at the rate of Rs 100 per ha for first two years and Rs 75 per ha for the third year.

3 A retired irrigation engineer who had been involved with IMT experiment in Maharashtra for a long time has evolved a fivefold classification of WUAs. These are: (1) sahib's WUA, (2) pudari/neta WUA, (3) WUA for highly deteriorating minor, etc, (4) anudani (for gaining grant) WUA, and (5) defaulter's WUA.

Agricultural Trade Policy and Export Strategy

V S Vyas

This paper reviews the performance of Indian agriculture in the context of the development in agricultural trade especially agricultural exports internationally and outlines a strategy for augmenting India's agricultural exports.

A STYLISED version of the changes in agricultural trade pattern during the course of economic development will suggest that with the growth of an economy not only does the share of agriculture in GDP decline so does the share of agricultural exports to the total merchandise exports. As the economy gets diversified non-agricultural commodities acquire greater importance in the product mix, and also in exports. Part of the explanation for the relative decline in agricultural commodities in the developing countries also lies in the rising share of processed agricultural products. On the imports side, with larger share of purchased inputs in the input base of agriculture, the quantum of imports of inputs such as fertilisers, pesticides, farm machinery, etc, rises. However, as the import intensity of agricultural production is low the earnings from exports outpace the outlay on imports. Most of the developing countries maintain a favourable trade balance in agriculture.

India is no exception to these general trends, with a few special features. During last two decades India's agricultural exports as a part of total merchandise exports have continued to decline from the preponderant position they occupied in the pre-independence period and in the early years of independence. Their share in the merchandise exports of the country in recent years (1991-97) ranges between 15 to 18 per cent. But with the achievement of self-sufficiency in foodgrains and some other major agricultural commodities, which used to account for a large portion of the import bill, the overall imports of agricultural commodities have sharply declined. The outlay on agricultural imports as a proportion of earnings from agricultural exports has progressively declined, and the overall balance has become progressively more favourable.

Contribution of agricultural exports to foreign exchange earnings is critical for a country such as India which faces a chronic balance of payment problem. With the growth in economy, specially with the growth of more import intensive sectors such as 'industry' the need for foreign exchange earnings from agricultural exports becomes increasingly more important. Expanding export opportunities also mean bigger markets and higher value for their output. However, while thinking about exports of agricultural commodities in a poor country like India the implications of export growth on domestic availability of agricultural produce, especially the foodgrains, cannot be overlooked. The moot question, therefore, is: how to augment export earnings without jeopardising the basic objective of food security. Discussion on these issues has, naturally, to take into account the new trade regime evolved after the Uruguay Rounds as the stated objective of the trading partners is to achieve economic efficiency and international competitiveness through increased reliance on market forces.

In the first part of my presentation I will briefly introduce the external economic environment obtaining in the recent years, more specifically after Uruguay Rounds. In the next part I will review agricultural trade policy as it has evolved in our country in the recent years and account for the important factors which have shaped the policy. I will also examine whether there is a need for any major shift in this policy. In the third part, I will look into the developments in agricultural trade specially the agricultural exports at the world level in the recent years and discuss the performance of Indian agriculture in this respect. In the fourth and final part, I will try to spell out the ingredients of a strategy to augment agricultural exports in the changing, and more demanding, global economy.

I
External Environment

The economic environment for agricultural trade is changing in a remarkable way due to changes in the domestic policies as well as in international trade arrangements. A number of scholars and practitioners have commented on the move towards the policies on liberalisation and globalisation and their implications for agriculture in our country [Bhalla 1994]. I will briefly touch upon the developments at the international plane and their implications for the agricultural trade. The international developments relevant to agricultural trade are taking place at tw levels. One, several groupings of th countries are emerging with the objecti of forming unified trade blocks, startin from EEC and ASEAN to more rece attempts at forming North American Fr Trade Agreement (NAFTA) and Sou American Free Trade and Agreeme (SAFTA) and, of course, South As Association of Regional Co-operatic (SAARC). Second, and probably mo important, development is the signing various agreements as a result of th Uruguay Round of trade negotiations. shall comment on the latter of these, tw developments mainly because the Urugu Round has now more or less univers coverage in terms of the countries agreein to its covenants. Also, because vario trade blocks would, hopefully, converg on a global trading system initiated by th Uruguay Round.

The significance of the Uruguay Roun agreements can be appreciated once it i recognised that for the first time agricultu is brought under the General Agreeme on Trade and Tariff (GATT) disciplin Until the present round of trade negot ations the contracting parties to GATT ha reconciled to a waiver on agricultural trad obtained by the US, which was also use by all other countries. The situation h changed, ironically, at the instance of th US which, in fact, pleaded for comple removal of all interventions in agricultu (the so-called 'zero-option'). The proposal to bring agriculture under GATT discipline evoked a responsive chord in several countries which were concerned with the rising burden of subsidies in their budgets.

After lengthy and tortuous negotiations under the Uruguay Round, agreements have been reached on several important areas. These include: (a) reduction in farm subsidies; (b) enhanced market access; (c) limits on public stock holdings of grains for food security; (d) sparing use of sanitary and phytosanitary import barriers; and (e) introduction of intellectual property rights.[1]

It is relevant to note here that the industrially developed countries made commitments in regard to all these provisions, and gave an assurance that concrete steps

would be taken between 1995 and 2000 to redeem their obligations. For the developing countries the implementation period is longer and the extent of reforms is less demanding. Special provisions have been made in favour of the least developed countries. Provisions have also been made to assist heavily importing countries to tide over the difficulties during the transitory period and to reduce possible negative effects of trade liberalisation on these countries.

The Uruguay Round agreements are a milestone in the development of the international trade in agricultural commodities. However, the exact outcome of various provisions of the agreements on the developing countries is difficult to foresee; partly because of great complexities of provisions and instrumentalities in the agreements which could subject it to a variety of interpretations. Even the highly simplified version which I have presented will not permit one to arrive at a definite conclusion on the net outcome of the agreements. This is mainly because a lot depends on the developed countries subjecting themselves to the implicit discipline of such agreements. Taking a more optimistic view, and making some heroic efforts, a few scholars have tried to foresee the results of these agreements on *a priori* grounds [Anderson and Tyres 1990; Goldin et al 1993; Brandao and Martin 1993]. Not surprisingly, they have not come up with a unanimous conclusion

One may speculate, again on a priori grounds, on the likely effects of the agreements on the agriculture of the developing countries. In spite of all the loopholes, it is quite likely that the agreements will help in reducing the amount of subsidies enjoyed by the agricultural producers in the developed world. This would mean that the price of agricultural commodities produced and traded by the developed countries will rise in the international market place. Since the bulk of agricultural production in these countries is accounted for by (temperate) foodgrains, especially cereals (and there too, mainly, wheat and corn), prices of cereals are likely to rise. If we were to continue as wheat importers this could result in an inflation-induced demand for wage rise, and would have deleterious effect on the pace of industrialisation. On the other hand, this would also act as an incentive for the domestic food producers to embark on production-raising efforts. The net outcome will depend on the supply elasticity of foodgrains production. The latter is high in the situation of developed infrastructure, stock of relevant technology, and efficient market institutions. Developments in these areas, even in the best of circumstances, will take some time. In the interim, the developing countries, particularly the food importing ones, will face an economic bind. The steps which are necessary not only for short-term relief, but also for equipping developing countries, including ours, to take long-term advantage of a liberal international trade regime in agricultural commodities should, in my view, include the following:

(i) Macro economic reforms which discourage high tariffs and overvalued exchange rates are beneficial to agricultural trade and need to be continued.

(ii) Adjustment of agriculture to a more liberal and global economy should be attempted carefully. A firm beginning could be made by domestic economic reforms, especially by encouraging liberalisation, deregulation and de-bureaucratisation within the country.

(iii) Implicit taxation of agriculture through price discrimination should be avoided. International prices could be used as referral for this purpose, although no sanctity need be attached to the border prices.

(iv) Nothing should be done to impair food security and poverty alleviation efforts in the process of economic reforms. Adjustment in the food sector should be gradual and non-doctrinaire.

India together with other developing countries should develop GATT consistent instruments to protect our interests. This is important because the next round of trade negotiations are on anvil, and we should not be caught unprepared [Vyas 1994].

II
Agricultural Trade Policy

India like several other large countries is not an export-oriented economy. This is particularly true of agriculture. In recent years the ratio of agricultural exports to agriculture GDP has seldom exceeded 3 per cent. This in itself is not a disqualification. Nor, if the example of the African countries is an indication, is a high export to GDP ratio a blessing in itself. The importance of exports as an economic activity has to be judged by the objectives it serves.

India's foreign trade regime till the reforms initiated in 1991 was primarily dictated by two important considerations, a quest for import substituting industrialisation and concern for dwindling foreign exchange resources. The major instruments used to implement these policy goals comprised quantitative restrictions, heightened tariffs, surcharge on imports, rebate on exports and severe restrictions on foreign exchange transactions. There were phases in which these provisions were relaxed. Yet the basic characteristics of an inward looking import substituting policy frame remained more or less intact [Srinivasan 1998]. The instrumentality of canalising a large part of exports and imports reflected the other element of developmental thinking, i e, an implicit distrust of the private sector and an implicit faith in the bureaucracy to achieve the stated goals of development.

All these ingredients of overall trade policy applied to agricultural trade, especially till 1966-67, i e, the second year of serious droughts of the mind-1960s. Till then agricultural trade was also subjected to a regime of quantitative controls and other state interventions to conserve foreign exchange. However, while in industry the policy of import substitution was clearly manifest, in agriculture the trade policy was designed to pursue twin objectives of food self-sufficiency and promotion of exports of the so-called 'commercial crops'. In regard to regulation and control, agricultural trade was no exception. The role of State Trading Corporation (STC) and the co-operative federations was emphasised as canalising agencies for agricultural exports. Public sector agencies were given an equally important role in the imports of inputs, particularly fertilisers and chemicals.

In the second phase, starting from the mid-1960s this policy was pursued more rigorously, and food self-sufficiency became the corner stone of the development strategies in agriculture. Two severe droughts, in 1965-66 and 1966-67, and the difficulties in importing foodgrains from food surplus countries – mainly the western countries – forced the policy-makers to opt for a policy of food self-sufficiency. Normally, an import substitution policy leads to high unit cost of production. However, mainly because of the availability of a high-yielding technology in cereals, not only was the food self-sufficiency achieved, the country could bridge the gap between demand and supply of foodgrains without raising the real cost of production, a fact which is generally not appreciated. In fact, along with higher yields the unit cost of production of superior cereals came down and benefits of growth in productivity could be shared by the producers (in terms of higher income) and consumers (in terms of stable prices) in an equitable manner [Vyas 1990].

This policy continued till 1991. Since then some questions have been raised about

pursuing the policy of food self-sufficiency. It is now suggested in some quarters that there is enough justification for opening up the food sector to international trade based mainly on the considerations of comparative costs, the latter reflected in the border prices.

The strategy of food self-sufficiency is being challenged mainly on three groups. Firstly, it is suggested that with the new economic regime brought in by the Uruguay Round of agreements, developed countries will also have to withdraw subsidies for agricultural products and, therefore, there will be a level playing field, and existing distortions in agricultural trade will be removed. Secondly, it is now generally accepted that food security means entitlement to food and, therefore, if the country can earn foreign exchange, import comparatively cheaper foodgrains and distribute it equitably, the country as a whole as well as the poor will benefit more. Thirdly, it is suggested that unlike in the 1950s and the 1960s when foodgrains surplus was mainly concentrated in the US and a few other developed countries there is more widespread distribution of tradeable quantities of foodgrains. There is hardly any country which is in a monopolistic position. In any case, it is argued, with big players in the foodgrain marketing, i e, the large multinational companies, governments' capacity to dictate trade pattern on political considerations has considerably weakened.

While there is a compelling case for instituting a liberal trade regime in agricultural commodities, there are certain key considerations which cannot be wished away. Agricultural commodities can be broadly divided into two categories, food crops and non-food crops. The distinction between the two is not firm but understandable. There is an established policy of encouraging exports in commercial crops, and it has to continue. There are, however, several reasons why the policy of food self-sufficiency which largely applies to self-sufficiency in principal cereals, i e, wheat and rice, has to continue. The major considerations justifying self-sufficiency in principal foodgrains are the following. Expenditure on foodgrains, mainly cereals, accounts for over 40 per cent of the expenditure of the bottom one-third of India's population. Any fluctuations in foodgrains prices will result in undue hardship for this section of the population. Price elasticity with respect to prices of cereals was estimated at –0.493 for the very poor and –0.409 for the poor in the rural areas. Corresponding figures for urban areas for the two groups of the poor population are –0.313 and –0.166 [Radhakrishna and Ravi 1992]. It is now well established that international prices are far more volatile than domestic prices [Nayyar and Sen 1994; Bhalla 1994]. Therefore, allowing foodgrains imports to any sizeable extent will be tantamount to importing price instability.

It is not only as consumers but also as producers that the poor have a stake in maximising foodgrains production. The bulk of the poor are in the rural areas. Their livelihood depends on the growth of agriculture. Currently, foodgrains occupy nearly 68 per cent of the cropped area and account for the same weight in output. There is a gradual shift in production from foodgrains to non-foodgrains in which, presumably, poor cultivators are also participating. However, the agricultural economy, particularly the economy of the small and marginal farmers is not resilient enough to enable poor farmers to make drastic switches from food crops to non-food crops within a short period. The switch from agriculture to non-agricultural production will be even more slow and gradual.

On the supply side, it has to be recognised that the foodgrain surpluses in food exporting surplus countries are not adequate to meet the demands of the large countries like India and China to any measurable extent. India's food requirements by year 2000 are expected to be in the order of 210 (209.4) million metric tonnes [Kumar and Mathur 1997]. The wheat requirement alone is estimated at 71 million tonnes and rice requirements at 88 million tonnes. The production of wheat in 1995 was estimated at 60.8 million tonnes and of rice at 78 million tonnes. If production of wheat and rice were to be frozen at the 1995 level, and the rest were to be imported, we will have to import not less than 10 million tonnes of rice and wheat each by the year 2000. On the other hand, global cereal stocks have declined to 14 per cent of the estimated consumption requirements in 1995 96. FAO considers 17 per cent of stocks as critical minimum, i e, a safety-margin for world food security. In the last year or so world stock of cereals have improved, but still remains below the safety level of 17 per cent [Pinstrup-Anderson, et al 1997]. With progressively larger demand from China,[2] and disruption in cereal production in former Soviet Union, any rise in India's demand for cereals would result in a rapid increase in the cereal prices. Thus, there is no escape from encouraging foodgrains production in the country, at least for the coming few years. The imports of more than a marginal quantity does not provide a viable solution.

A question which is not directly addressed is whether the food surplus-developed countries have the capacity and the economic rationale to keep increasing their exportable surpluses in foodgrains. More so, once the prop of subsidies is gradually withdrawn under the new international trade regime. Unfortunately, we do not have any systematic study on the supply response of foodgrains in developed countries. Unless one assumes that agriculture has, and will continue to have, comparative advantages over, say industry, in these countries, it is unrealistic to assume that developed countries can be relied upon to meet the progressively enlarging demand for foodgrains of a country such as India by putting more resources in their agriculture and without seriously escalating the prices.

The other major consideration is the availability of foreign exchange to meet foodgrains imports. The exportable surplus of foodgrains, particularly wheat is still concentrated in five developed countries, the US, France, Canada, Australia and Germany, which accounted for nearly 73 per cent of the total exports of wheat in the triennium ending 1995. The situation is better in the case of rice as all major exporting countries, except the US are from the developing world. The country will have to augment its foreign exchange earnings manyfold to enable it to import foodgrains, especially wheat. Even if foreign exchange resources are available, there are much better uses for these resources, e g, in the imports of industrial raw materials, etc. So long as the other 'commercial crops' do not generate measurable foreign exchange surplus, over and above the cost of imports of agricultural inputs the country cannot afford to divert foreign exchange resources to import large quantities of foodgrains. Lastly, the political implications of dependence on imports of foodgrains, most of which have to be brought from the developed countries, should not be underestimated. The post-Pokharan sanctions have once again reminded us that we are living in a unipolar world in which one country has a decisive voice.

There is no escape from expanding foodgrains production domestically to meet the basic requirements for food. Marginal imports of food, say, one to two million tonnes in the total requirement of 200 million tonnes does not vitiate the above arguments. Nor does a 'switch' trade of a few hundred thousand tonnes go against the tenets of food self-sufficiency.

However, food self-sufficiency is not a matter of faith. We can review the policy when the following conditions are met:

(i) When expenditure on food becomes a minor part of the consumers' budget, especially the budget of the poor;

(ii) When food production does not remain the main source of livelihood for the small and marginal farmers;

(iii) When non-food exports become sufficiently buoyant to generate enough foreign exchange surplus;

(iv) When the country has enough buffer stocks to ward off any significant price fluctuations imported from external sources; and

(v) When there are numerous and assured sources of supply to cope with any sizeable short-fall in domestic foodgrains production [Vyas 1994].

III
Prospects of Agricultural Exports

All this does not minimise the need for augmenting exports. Traditionally plantation and the fibre crops occupied the primary position in the agricultural exports of our country. Cereals, and in the later years oilseeds, occupied a dominant position in the imports. From the beginning of the planning era a two-pronged approach to the international trade in the agricultural commodities became evident. The major thrust of the policy was towards imports substitution in the foodgrains area. As against this, non-food commodities, which in common parlance are referred to as 'commercial crops' were identified for export promotion. As I have mentioned earlier, there were justifications for two different norms in relation to these two commodity groups.

Important changes are taking place in the demand and supply of foodgrains in our country which has prompted some people, who are willing to accept the strategy of food self-sufficiency in the time of foodgrains deficit, to question the same strategy once we have foodgrains surplus. They advocate that India should not aspire to become a major foodgrains exporter. This position also needs to be examined carefully. It is suggested that for following reasons, we may have exportable surplus in foodgrains:

Although the rate of growth in foodgrains production in the 1990s is slower compared to the rate of growth in the 1980s it is still ahead of population and income-induced demand for foodgrains.

The intake of foodgrains in general and cereals in particular is at a much slower pace than was anticipated by the planners. As a result margin between the availability of cereals in relation to demand, year to year fluctuations notwithstanding, is widening with foodgrains supply outpacing the demand.

The real cost of buying a kilogram of foodgrains, say wheat, is lower today than it was earlier. This suggest that slackening of demand is not due to higher prices but due to a change in the structure of demand; latter induced by the growth in income as well as by non-economic factors, such as urbanisation.

Surplus of supply over demand is particularly noticeable in the superior cereals, i e, wheat and more particularly in rice, mainly because of the availability of high-yielding technology in these crops. This technology is not yet fully exploited and one can expect a further increase in the output of these crops.

If the exports of cereals is considered as 'residual' after meeting the domestic demand on the grounds I have argued earlier, then the case for an export initiative in foodgrains will hinge upon the emergence of genuine surplus in the grains. Without dependable 'surpluses', at this stage of development, it will be premature to give a go-bye to the policy of food self-sufficiency. Thus, in order to launch a strategy for exports of foodgrains first we must ensure that there would be distinct possibility of surplus emerging in the foodgrains sector. Assuming that the rate of growth in foodgrains production will continue at the rate of 3 per cent per year or so, which given the nature of domestic demand will be adequate to meet our foodgrains requirements, what should be our strategy for the disposal of surpluses in the foodgrains sector? For this purpose we need to look into the possibilities for each of the major cereals separately.

A carefully done study has shown that we do not have any comparative advantage as wheat exporters [Reddy and Badri Narayanan 1992]. Besides, as I have mentioned earlier the competition for this crop will be provided by the traditional wheat exporters, i e, by the developed countries such as the US, Canada and Australia. True, compliance to WTO conditionalities may blunt their competitive edge with progressive withdrawal of subsidies, there are various ways in which they could support their wheat producers and make it difficult for us to compete.[3] In case of wheat if we have genuine 'surplus' after meeting our domestic demand, we should encourage diversion of resources to other competing crops, or out of the agricultural sector, rather than embark on a quest for becoming a major wheat exporter.

We have distinct advantages in rice, and can emerge as moderate exporter of rice. It is one of the few agricultural commodities where the domestic and foreign price ratio has remained in country's favour in recent years [Reddy and Badri Narayanan 1992]. At the same time we should recognise that marketable surplus in rice is limited, and the price elasticity of rice is very high [Kahlon and Tyagi 1983]. In the major rice growing states, the existing inverse relationship between size of farms and area under rice does not promise a substantial marketable surplus. This means that a small drawl from the domestic markets would give rise to disproportionately high prices. Rice is the staple food of the majority of the people. Even a small rise in the price will affect the living standard of the large, vulnerable sections [Chellaraj et al 1992].

In order to establish ourselves as rice exporter and at the same time to safeguard food security of the rice consuming population in the country we need to develop a different strategy. While continuing the export of basmati rice targeted mostly to West Asia, and to NRIs in Europe and the US we should recognise that there is a limit beyond which we will not be able to export basmati and other fragrant varieties. The real market for rice is in south east asian countries, eg, in Indonesia, Malaysia and Philippines and in east asian countries, i e, Japan and South Korea where rice is the staple cereal. It seems that the principal rice exporter to these countries, ie, Thailand has reached a plateau in rice exports [Chaowagal 1996] while the demand for rice in the countries listed above is slowly but steadily rising.[4] Further, the rice markets in Japan and South Korea which were till recently virtually 'locked up' are bound to be opened. If we want to be a major player in the rice market we should develop varieties which are preferred by the consumers in these countries and then market them vigorously. Even with inadequate preparations we could market more than three million tonnes of rice in 1995-96, admittedly due to fortuitous circumstances. There are distinct possibilities of raising the exports to a couple of million tonnes, if we look into the problems and issues in rice exports in a systemic perspective [Datta 1997].

The other cereals, i e, barley, maize and millet are used mainly as cattle feed in the developed countries. Barley and maize are also demanded as industrial raw materials. Demand for these cereals is increasing much more rapidly than for rice or wheat with increasing share of animal products in human diet in the developed as well as

in developing countries. However, with low productivity we do not have competitive edge in these cereals. If we wish to tap the expanding cattle feed market in the world we will have to raise productivity in these cereals and also change to varieties to suit international demand. In India these cereals are grown mainly as food crops by small farmers and mostly on infertile lands. Progressively more and more area under these crops should be brought under varieties which are suitable as cattle feed. Technical possibilities of raising productivity level in these so-called 'inferior cereals' are high. High-yielding varieties are being developed in maize in collaboration with CIMMYT. We have developed our own high-yielding varieties in millets. These varieties need to be given as much importance in our extension efforts as high-yielding varieties of wheat and rice received in the hey-days of green revolution. There is an added advantage in increasing productivity in these crops in terms of equity, as these crops are, generally, grown by the poorer sections of cultivators and in backward regions. An increase in their productivity, and in value, will benefit disadvantaged sections. Already, due to the prospects of good market and higher prices, large areas are being diverted to high-yielding irrigated maize. This tendency should be encouraged with an eye on generating surpluses for exports.

The second group of commodities to be considered as thrust area are our traditional export commodities, namely, tea, coffee, cotton, oilseeds and cakes, tobacco and sugar. Among these commodities both tobacco and coffee have a dynamic demand. We have not been able to make full use of this surge in demand because of low productivity. There is need to earmark these crops, especially tobacco, as special crops for exports. Tea which is still one of our important export commodities is stagnating in the international markets both in terms of prices and quantities. This is partly due to the demand factors – international demand for tea is lagging behind the demand for other beverages, especially coffee, at the same time domestic demand for tea is rapidly increasing – but mainly because we have not been able to impart efficiency in production and marketing of tea as much as some of our competitors have been able to do [Chiranjeevi 1994]. India should continue to aspire and work for a leadership position in this crop.

Among our traditional agricultural exports two commodities, namely, cotton and sugar are problem ridden. This is mainly because of uncertainty and fluctuations in the production. The uncertainty is further exacerbated because of ad hocism, if not due to the pressure from powerful vested interests, in designing the export policies. Without stabilising the domestic supply base there is no point in emphasising sugar as an export commodity. Unless a base of assured supply is created it will be difficult to compete in the international market. In case of cotton possibility does exist to keep our presence in the international markets [Acharya 1996]. However, in order to exploit our comparative advantage in this commodity, we have to minimise wide year to year fluctuations which are induced as much by natural phenomena as by the inept export policies.

In refining our export strategy more important considerations should be given to what we may call the 'dynamic commodities' in international trade. To identify such commodities I have looked into the growth of world exports in different commodities during the period 1989 to 1995. Among the major agricultural commodities which have shown high rate of growth, the following are notable: Tobacco unmanufactured, milk and milk products, rice, fruits and vegetables, coffee, soyabean and soyabean oil, oilseeds, cakes and meals.

India's share in these commodities is very small except in two commodities, namely, tea and rice. besides, India accounts for nearly 8 per cent of world exports in oilseed cakes. In rest of these 'dynamic commodities' our share is negligible, in many cases non-existent. On the other hand most of our traditional exports, except rice (which in any case is a new entrant in agricultural exports) are stagnating, if not declining.

If we want to make our agriculture exports a major plank of export strategy it is important to concentrate on the commodities which constitute the dynamic group, especially those as milk and milk products where we have distinct comparative advantages. India is the second largest producer of milk. In terms of resource use efficiency, its cost of production is the lowest among the major dairy producers except New Zealand. However, as I will try to indicate later the low cost of production is only one of the factors to impart a competitive edge. There are equally important questions of quality and reliability

Export operations are essentially private sector operations. Traders in agricultural commodities will always seek opportunities to make profitable deals. So long as their interests do not conflict with wider national objectives they should have fredom to do so. It was not my intention to narrow down the list of exportable commodities. My purpose was to illustrate some of the key considerations which government should keep in view while developing an export strategy. To summarise, following could be used as guidelines:

(i) Commodities such as cereals deserve an export thrust only after the domestic demand is satisfied.
(ii) Commodities with large fluctuations in the supply or in prices (cotton, sugar) should be traded with caution, unless compensatory mechanisms are put in place, such as forward trading to compensate for the risk and uncertainty.
(iii) Commodities where we have dynamic comparative advantage, such as fruits and vegetables (because of diverse climate and soil conditions), and dairy products (because of large cattle herd and low cost of production) should receive special attention.
(iv) The varieties which have expanding world markets (rice for the east Asian markets, millets for cattle feed, and maize and barley as industrial raw materials) should be given high priority in our export strategy.
(v) There should be some consistency, and long-term thinking, while designing the export policy. An ad hocism or surrender to vested interests (sugar and cotton export policies illustrate) can do severe damage to our export prospect.

IV
Elements of a Strategy

India's export efforts have to be made in an environment which is characterised by progressively more openness and competition. Corollary to that is the need for customer orientation, quality consciousness, timeliness and reliability, and, of course, competitive prices. Indian exporters of agricultural products have to go a long way to establish their superiority on these counts. Some of the important aspects which deserve special attention are as follows:

One of the major handicaps faced by Indian exporters is the lack of information on the key aspects of exportable commodities and relevant developments in the export markets. The exporters may be able to gather partial, and not necessarily accurate, information on prices, supplies and demand for the commodities they are dealing with, and may have some general

idea about the cost of ancillary operations in transport and handling. Such partial and inaccurate information is not a substitute to timely, comprehensive and systematic information. As far as the agricultural producers are concerned their information on these matters is minimal. Even the policy-makers are not fully aware of the developments in our client countries where we may have interest either as exporters or as importers. We do not have systematic collection of relevant data; most of our information is based on the newspaper reports or on routine dispatches from the concerned sections of the embassies. There is a need to have a nodal point both at the centre and in the states for collecting and collating all relevant information for the commodities in which we wish to play a role. Equally important is the dissemination of this information. In this respect the agricultural marketing boards and committees, which many of you are representing here have a significant role. The linkage between the nodal agencies at the centre and the states and the marketing committees at decentralised levels has to be firmly established.

Agriculture is becoming progressively more knowledge- and skill-based activity which also gets reflected in agricultural trade. If we want to make a dent in agricultural exports we should ensure a firm support from agricultural research and technology. Part of the reason of our losing grounds in our conventional export crops, say tea, is the stagnation in productivity. When it comes to the newer products, apart from a high level of productivity the need for encouraging specific qualities in the products becomes important. As I have mentioned earlier, if we want to be a major exporter in rice we have to think in terms of developing varieties which are preferred by the south-east Asian and east Asian countries. Similarly, we have to develop the maize and barley varieties which can be used profitably as industrial raw material. There is an equally urgent need to develop varieties in millets which can serve as good cattle feed. Without a proper research base it will not be possible for us to play a significant role in the emerging markets. But with proper research support the possibilities are immense.

Generally, it is proposed that if we want to have a competitive position in agricultural exports we will have to revise our norms of land ceiling. It is contended that only large farms will be able to give the output of desired quality, uniformity, etc. This is a false notion. Nowhere in the world the large farmers enjoy superiority as primary producers. In most of the circumstances there is an adverse relationship between size and productivity; in some very special circumstances the primary production may be neutral to scale. It is true that most of primary products need proper handling, sorting, grading and initial processing particularly when they have to be exported, and these operations have scale economy. The solution is not large farms but specialised agencies to do precisely these tasks. In a very large number of countries where such products as fruits and vegetables or dairy products are exported in bulk the primary production is left to the small producers, but there are organisations at the secondary level which bring in the required degree of expertise and specialisation.

Through various arrangements ranging from co-operatives to contract farming the small farmers can contribute to agricultural surplus without being dispossessed of their meagre land base. Examining these possibilities at the instance of FAO, by looking into the co-operative arrangements for processing in a large number of countries in Asia, Europe and America, we found that with proper organisational support at the secondary level size of operational holding was not a handicap even for the sophisticated products [Vyas and Kruse-Rodenacker 1974]. Within our own country the success of the dairy industry as well as the sugar industry illustrates this point. What is required therefore is to organise appropriate secondary organisations and equip them with adequate resources and expertise. At the same time the arrangements which these agencies make – be they public, private or co-operative organisations – with the primary producers have to be open, transparent and mutually beneficial. A two-tier organisation for production and processing of exportable agricultural commodities is a practical solution which will prove economically viable, and will not jeopardise the interests of the small producers.

Exports of, what I have described as 'dynamic commodities', eg, fruits, vegetables, dairy products, flowers, fish products, etc, while present an exciting possibility is not going to be a cheap proposition. Substantial investment in infrastructure, starting from roads and communications to the warehouses and cold storage facilities, together with the investment in human resource development, has to be made to get a competitive edge. Export-oriented agriculture is going to be fairly capital-intensive. The encouragement to private sector for investment in infrastructure facilities, particularly in warehouses and cold storages, etc, is needed, and the handicaps faced by th private sector in these areas have to b removed. However, the government canno abdicate its responsibilities. The invest ment in infrastructure creation should b considered as a part of export strategy.

With the signing of WTO agreement it will become progressively more difficul for the developed countries to impos quantitative restrictions or place high tariff They however can take recourse to non tariff measures, mainly on the ground o quality. It is important therefore that th Indian exporters must be fully aware o the standards accepted by the internationa importers and should have mechanism introduce these standards right at th primary level. Our record in this respec has not been always inspiring [Achary 1996]. Again, there is a role for agricultura marketing organisations to contribute t the establishment, and compliance, of th rigorous quality standards on which th prospects for exports are vitally dependent The Uruguay Round agreements hav sanitary and phytosanitary provision which the exporters are supposed t comply. Steps should be taken to mak producers, traders and exporters aware o the health and safety standards impose by different countries.

Let me conclude: Because of the divers climatic and soil conditions and a enterprising peasantry as well as a tradin class, India has the necessary qualification to emerge as a leading exporter of agricultural commodities. The external climat is favourable. It is important now to desig a strategy which should give us benefit o external trade without jeopardising th basic goals of food security and povert alleviation.

Notes

[This is a slightly revised version of the presidentia address delivered at the XII Annual Conferenc of the Indian Society of Agricultural Marketing.

1 I have discussed these agreements in somewha greater details in a paper I had prepared fo the Asian Productivity Organisation's Stud Meeting on Agricultural Trade Policy in Asi Pacific [Vyas 1996].

2 An IFPRI study concludes that by 2000, China' import of foodgrains is expected to reach 24 million tonnes. Increasing imports arise mainl from the accelerated demand for meat an foodgrains and continued slowing of suppl [Huang et al 1997].

3 Ways to defeat the purpose and objective o the Uruguay Round of agreements could includ resort to anti-dumping and similar provision just to defer the agreed tariff reduction; mi up environmental protection and wages an labour standard issues with trade policy; objec to the use of several chemicals which are no used in temperate countries but may be useful and harmless, in tropical countries, undermine

the global convent by unduly emphasising regional trade agreements, such as NAFTA.

4 However, the position of Vietnam and Myanmar as important rice exporters should not be underestimated.

Regulating Transgenic Plants in India

Biosafety, Plant Variety Protection and Beyond

A Damodaran

This article argues for viewing the issue of regulation of transgenic plants in India from both the economic and biosafety angles. The article argues that transgenic products could meet with resistance from the market place in India due to complex patterns of demand amongst farmers for new cultivars. This aspect coupled with the policy and law framework have the potential of providing adequate checks and balances on oligopolistic tendencies of biotech companies, transnational or domestic. Also discussed are certain lacunae in India's policy-legal framework which need to be addressed for converting the potential into realisable results.

DEBATES on genetically engineered plants and foods were originally triggered in the west by biosafety concerns. It took some time for these debates to progressively mature to consideration of social and economic ramifications of genetic engineering and transgenic plants. By comparison, the recently engendered controversy over the B_t cotton trials and the terminator gene in India has managed to cover a wider canvas whereby both the biosafety and the economic ramifications of the technologies have been addressed. Media reports about the two controversies in India have not only focused on the possible biosafety aspects associated with the two developments but have also covered the impact of the technologies in terms of Monsanto's changing economic fortunes. Nevertheless discussions on the economic implications of transgenic plants in India have not been well-focused. This article accordingly attempts to address the economic issues inherent in commercialisation of transgenic technology and proceeds to argue that market demand 'incoherence' could perhaps form a barrier to transgenic plants in Indian agriculture. It also explains how India's policy and law framework could, in addition, provide adequate safeguards against negative effects of 'transgenic' business, provided the framework is properly articulated and efficiently implemented.

I
Transnational Economic Logic of Transgenic Plants

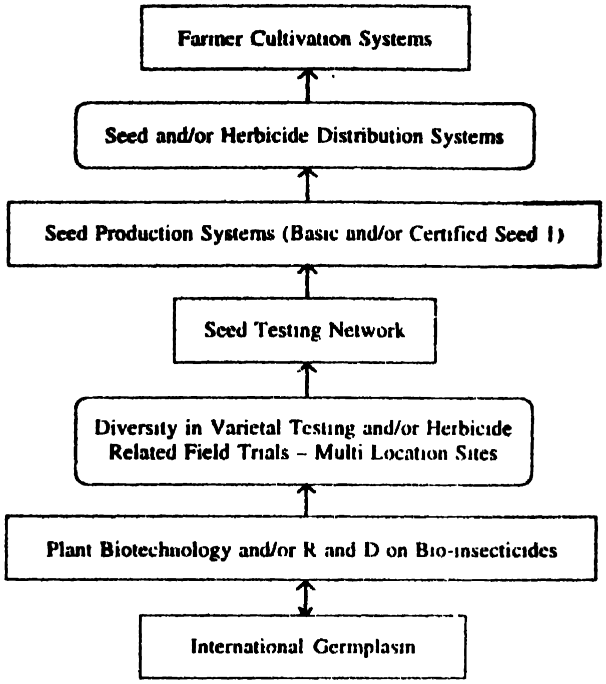
One feature of the debates on the B_t cotton trials and the terminator gene in India has been its major focus on the impact of these technologies on biosafety. Media reports in India while discussing the relative merits and demerits of the B_t cotton trials and the threats posed by the terminator gene have also been pouring out stories of how Monsanto, which began on an obscure note in 1901 in Missouri, US had transformed itself into a world 'power' in the field of biotechnology, herbicides and seeds business by the turn of the 1980s. The story of this transformation does not come as a surprise to biotech-watchers as they see the change as a logical adjustment process adopted by major biotech firms for overcoming their economic teething problems. Faced with a situation of insignificant market share for its products and stiff competition from conventional industries such as chemicals, biotech industries had to acquire a distinct economic shape.

Despite great progress in biotech research during the 1970s world trade in biotechnology products (excluding alcoholic beverages and cheese) accounted for just \$ 20 billion in 1981. This paled into insignificance compared to the value of \$ 200 billion in traded products achieved by the traditional chemicals industry [Hacking 1986:15-16]. The fact that plant biotechnology was at its infancy in the 1970s in the growing biotech industry, can be gauged by the fact that trade in genetically engineered seeds formed only one-sixth of that of alcohol beverages in 1981 [Dunhill 1981 cited by Hacking 1986] which formed the chief biotech product traded in the world during that year. The slow progress of molecular biology until the early 1980s was a major factor inhibiting progress in plant biotechnology. By mid-1980, following the wonderful strides made by genetic engineering and in particular molecular biology, plant biotechnology made rapid advances. The plant patents legislation and plant varieties protection legislations in Europe and the US modelled on the UPOV Convention, gave a tremendous degree of protection to this infant industry. But 'market' size was still a stumbling block [Hacking 1986:271].

The market for the bacterial insecticide Bacillus thuringiensis was controlled in the 1980s by three players, viz, Abbott, Sandoz and Solvay. However this product was turned out by these companies in multi-product plants as the market was never large or lucrative enough to justify the construction of a new plant dedicated to the production of B_t bio-insecticide [Hacking 1986]. As Klausner (1984) estimated, B_t pesticides were 20-25 per cent more expensive than comparable chemicals and up to 10 times more expensive to spray than DDT or other chemical pesticides used against mosquitos [Lisansky 1984]. If the superb cost competitive edge enjoyed by DDT was lost, it was on account of the introduction of environmentally sensitive pesticide legislations in Europe and the US that banned the use of DDT and BHC in the 1980s and shut out imports of agriculture commodities having residual traces of these chemicals.

The high relative cost of hi-tech bacterial insecticides like B_t coupled with the necessity to achieve economies of scale led to horizontal and vertical integration by aggressive players during 1970s and 1980s. A process of mergers and acquisitions by 'lead companies' ensued. While until the early 1980s the trend was for biotech, seed and agro-chemical companies to operate as 'distinct' but connected entities in reaching their services to their clients, the situation changed as companies like Monsanto that specialised in 'chemicals', successfully attempted to get in and consolidate their position in the biotech sphere through a process of horizontal and vertical integration. In the process, chemicals and biotechnology industries involved in fundamental research got to move closer to seed companies that specialised in testing, production and distribution of seeds of improved plant varieties. Transgenic technology, an integral but dynamic part of the plant biotechnology industry, also followed the logic of concentration of capital achieved by horizontal and vertical integration.

FIGURE 1: POSSIBLE STRUCTURE OF INTEGRATION PROPELLED BY PLANT BIOTECHNOLOGY



Whether this logic met with operational success or not is a separate issue.[1]

The economic logic for the integration process of the type described stemmed not only from market-related factors but also from the high-risk nature of these enterprises specialising in biotech research. Genentech, one of the pioneer biotech companies based in the US did not have a happy experience with its offer of shares to public in 1980 at $ 35 per share. Though within months the same shares shot up to $ 85 per share, the capital value also sharply went up from $260 to $660, which proved to be clearly unsustainable. A collapse in value followed. Since Genentech, 60 companies in the US which went public, also had to undergo sharp fluctuations in share prices due to public perception of these shares companies being hi-tech and high risk ventures. Venture capital and equity formed the chief sources or method of raising capital by US-based biotech companies in the 1980s [Hacking 1986:250-52].

Armed with strengths provided by the integration process, plant biotech companies adjusted well and adapted swiftly to the changing protection regimes for their products induced by withdrawal of patent cover on their products. For example, until the removal of patent cover in 1987, the herbicides Lasso and Roundup were amongst Monsanto's flagship products. By 1987, when the patent on Lasso had elapsed, ICI and BASF had stepped in with herbicides similar in qualities as Roundup. It was at this stage that Monsanto seriously got into the process of developing Roundup herbicide resistant soybean and maize varieties to meet the threat of diminishing sale of its flagship herbicides. The Roundup Ready Cotton was another major product, which epitomised this strategy. This change in strategy necessitated a major infusion of capital in R and D projects and acquisitions of biotech and seed firms [Prakash 1995]. Monsanto was not alone in this pattern of adaptive behaviour. Bayer had got into a similar strategy mode of product complementarily involving its flagship herbicide 'Sencor'. By identifying and isolating an enzyme that helped to break down 'Sencor' from a tomato variety and transgenically introducing the gene in soybean and other crop fields applying sector [Prakash 1995:309]. Bayer hoped to achieve product complementarity. Similarly cases can be narrated of the efforts of Pioneer Hi-bred International to develop herbicide-resistant maize hybrid in the US [Prakash 1995:311, 313].

This phenomenon of complementary product research and production provided a major stimulant to the process of horizontal and vertical integration. Since the 'comple-product' strategy aimed at integration of herbicide and seed industries from the point of view of testing and distribution, synergies achieved by mergers that were integration oriented, could achieve not only economies in marketing for seeds but also economies in the matter of distribution of herbicides. The logic of the horizontal and vertical integration process was summed up by Jack M Kennedy, director (agriculture) Monsanto Company in a press interview on June 14, 1998 in Mumbai (interview with G Chandrasekhar, *Business Line*) a few months before the B_t Cotton testing and the terminator gene controversy broke out in India.

As Kennedy stated in this interview "Monsanto needs partnerships to move from research and development (R and D) on genes down to the farmer. So, we need germplasm: we need a strong distribution channel; we need grain handlers; and so on. The company is therefore trying to align itself with all parts of the value chain. The first thing we need to have is access to germplasm. So we have entered into partnerships with seed companies. Recently, Monsanto acquired 100 per cent interest in two US companies, namely Dekalb Genetics Corporation, a corn seed company and Delta and Pine Land Company, specialising in cottonseed. Specifically, in India, we acquired a 26 per cent stake in Maharashtra Hybrid Seed Company Limited (Mahyco). We moved into India for cotton at the invitation of Mahyco which saw years ago a huge opportunity for B_t cotton [a patented seed incorporating the Bacillus thuringiensis or B_t gene for protection from insect] and sought Monsanto's help. We created a 50:50 joint venture company called Mahyco-Monsanto Biotech, not only for cotton, but for all crops. Our primary focus right now is largely on B_t cotton in India. So, globally we will continue to create relationships for gene technology with germplasm because that is what the farmer wants."

In the same interview Kennedy discusses the Cargill-Monsanto joint venture and observes "It is a global joint venture for improving the nutrition of grain for animals. We have the technology to do that. Clearly, the next step is to expand. We have the technologies to improve nutrition for humans. That's an example of how not only sourcing of germplasm, but also access to partnership with all those connected with the food chain is important. We have signed an agreement with Rallis India for the distribution of Monsanto's branded herbicides. Rallis is strong in agricultural inputs, extension services and training. It is a normal distribution arrangement. We see the use of herbicides growing at 20-25 per cent annum."

These statements were made with special reference to the Monsanto acquisitions in 1998 of Cargill's international seeds business, Dekalb Genetics Corporation (a corn seed company) and the Delta and Pine Land Company specialising in cotton seed in 1998. It may be recalled

that even during 1995-97 Monsanto was on a acquisition spree. It acquired major shares or controlling interests in Calgene, Agracetus (another agro-biotech company), Asgrow Agronomics, Holden Foundation Seeds and Sementes Agroceres, a Brazilian supplier of maize seeds amongst others. Thus Monsanto which began as a producer of a range of chemicals (including saccharin for Coca Cola) and notable herbicides, such as 'Agent Orange', had, after the flurry of acquisitions during 1995 to 1998, emerged as the world's largest agro-chemical firm, the second largest seed company and fourth largest pharma giant. This development symbolises 'oligopolistic' tendencies. Taking a cue from the Monsanto story a stylised illustration of the vertical and horizontal integration scheme characterising a plant biotech driven MNC is illustrated at Figure 1.

II
Demand for New Plant Varieties in Developing Countries

Vertical and horizontal integration and concentration of production and distribution process by itself may not produce oligopolistic tendencies unless there exists scope for oligopolistic pricing. Patterns of market demand can facilitate or block oligopolistic pricing of transgenic plants or their reproductive materials. The market performance of transgenic varieties are yet to be assessed in Indian conditions. There are conflicting media reports on the poor performance of B_t cotton plant to the bollworm (the focus of the present controversy) in the US. The same situation is reported for the Roundup Ready Cotton.[2] B_t cotton is yet to reach the stage of commercial application in India. The IARI's B_t brinjal and B_t tomato are yet to reach the field trails phase. Meanwhile resistance to B_t cotton field trials in India and to transgenic plants in the UK, confirm that the inertia to accept seeds with transgenic genes could be stronger than the demand for non-transgenic reproductive material.[3]

In the absence of data on market performance of transgenic varieties in India, one has to perforce rely on demand patterns of new hybrid seeds in the Indian market as a proxy, if not as a baseline, to assess the scope for oligopolistic pricing of transgenic plants and seeds in the Indian situation. In the survey taken up for the purpose of study, we went one step further than merely a proxy survey of demand for hybrids.

Judging by the performance of hybrid varieties, India can be supposed to offer a reasonable market for hybrid seeds and new cultivars for rice, maize, wheat, bajra and vegetable crops. But in vegetables a mixed picture obtains. According to Rai and Tiwari (1998) F_1 hybrids of cabbage and tomatoes accounted for 31.5 per cent of land area under the two crops in India in 1997-98. In comparison, the share of hybrids in the land area under cauliflower, chillies, gourds, melons averaged 10 per cent despite these crops accounting for 60 per cent of the total vegetable cropped area in the country. If one considers Brinjal with a share of 17.8 per cent, in the 'low hybrid coverage' category, the share of vegetable crop area 'not under hybrids' could go up to 76 per cent. Therefore the market share for hybrids in India cannot be generalised as 'good' or 'bad'. Market shares for hybrid seeds in India have varied from crop to crop and region to region. The 'demand' for transgenic plants or seeds may be more uncertain, given its 'safety' aspects and the general risk-aversion propensity of Indian farmers in relation to new agricultural technologies.

Hypotheses such as the one propounded by Dekalb Genetic Corporation that a year of low commodity prices contribute to enhanced farmer interest in products that give them 'premium' price may hold in developed countries but not necessarily for Indian agriculture.[4] The Dekalb hypothesis lies at the base of research on transgenic plants in the west. For example efforts of US companies such as Escagenetics to develop transgenic arabica coffee with 'low caffeine' and 'high percentage of extractable solids', to satisfy the requirements of health conscious coffee drinkers in the US and Europe may not hold much attraction to Indian growers of coffee as shown in the subsequent section. This is because coffee growers in developing countries who battle volatile international prices for coffee consider cost efficiency and productivity to be key factors guiding their economies.

Similarly while it is axiomatic that farmers' demand for transgenic crops will be determined by their economic benefits, it is often ignored that there are two dimensions of demand for transgenic seeds from the farmer community. One, the demand for transgenic varieties prior to introduction of these plants in farmers' fields and two, the continuing demand for the new 'superior' varieties after they have been introduced in farmers' fields and after their results are assessed in actual farm conditions. Very often, economic benefits are calculated or reckoned in the latter or *ex-post* sense. A statement to the effect that a farmer in India will take to a new variety (including a transgenic variety) if he find returns to be 10 or 20 per cent more tha what he gets from the old variety, is a *ex-post* assessment since it speaks of th demand situation once the new variety ha gained entry in the farmer's field. In th non ex-post sense demand for a transgeni variety is taken as the initial 'inertia' t shift to a new variety by leaving the olde one. In other words, demand for a new plan variety including a transgenic variety needs to be assessed on the basis of th initial barriers to entry for the new variety These barriers in turn basically stem fron attachment (or lack of it) to the extant culti vated varieties, on the part of the farmers

A chance survey by the author fo obtaining information on cost-productivity trends amongst a group of mediun farmers cultivating the crops of coffee watermelons and finger millet in Karnatak during January 1997, formed the basis o the present assessment exercise of marke demand for transgenic plants and seec varieties. It was discovered in this survey of 65 medium farmers in three districts o Karnataka, that there was no standar demand pattern prima facie in the matte of new varieties of seeds for this grou of farmers. These results led to a secon round of surveys in January 1999 of th same set of farmers to elicit their specifi demand pattern for hybrid and high technology seeds which was explained a including genetically engineered seeds The general observation that could b gathered from these surveys was that th barriers to entry for new varieties is conditioned by subjective assessments on th part of cultivators, which are mainly guide by their propensity for risk aversion. Som sections of the surveyed farmers indicate their perception of new varieties as 'goo in some respects and bad in others' i comparison with the existing varieties. I practice, this meant that even when farmers expected new varieties to be an improvement for certain critical parameters, they expected these new varieties to exclud some of the good attributes of the existin varieties. This assumption marred deman for new varieties in many cases, thereby constituting a barrier to entry for ne varieties of plants.

The surveys conducted for this study were unconventional in approach. Ther was no effort to collect from each sample farmer his cost-productivity figures i monetary terms. This was because farmer were cagey about providing the correc financial picture of their cropping whe initially confronted in the pre-survey meetings held in October 1996. Therefor the strategy was to conduct two round

of surveys. In the first round of surveys the effort was to determine costs of cultivation for two of the three different crops surveyed, viz, coffee, watermelons and finger millet in real terms of different threshold levels of output. For arabica coffee, the real input data as gathered from the survey of 25 coffee growers was utilised to work out the monetary costs in terms of current plant protection chemicals, fertiliser costs and labour wages.

During the first round, 'real' data was obtained on various threshold levels of productivity attained by the sampled farmers during the previous 10 years. The labour input for various operations were quantified for the highest, medium and lowest levels of threshold productivity as specified by the growers. The quantum of fertilisers and pesticides applied at these levels of output were worked out for the three crops of finger millet, watermelons and arabica coffee. The real data obtained thus was converted into monetary terms at current (1998) prices. Correspondingly average revenue realised for 1998 was also noted for the fair average quality grades of the produce. In the second round of surveys held in December 1998 – January 1999, the same farmers were accosted with the worked out monetary costs and interviewed on their preferences for improved and new varieties including transgenic varieties in terms of different threshold levels of productivity. Deviation from the worked out monetary costs were also ascertained.

The 65 farmers were chosen from the districts of Bangalore, Chikmagalur and Hassan in Karnataka. The farmers in Bangalore District were surveyed for information on finger millet and watermelon crops, while the farmers of Chikmagalur and Hassan were surveyed for information regarding arabica variety of coffee. Of the sampled farmers, 15 raised watermelons (five of whom raised exotic watermelons), 25 cultivated hybrid and local landrace varieties of finger millets (15 cultivating both types and 10 exclusively cultivating just the hybrid variety) and 25 farmers were coffee growers in Chikmagalur and Hassan growing arabica coffee. The crops chosen for survey were a balanced mix – (1) a long duration plantation crop (coffee) with a gestation period of four to five years and a life span of nearly 40 to 50 years; (2) a horticulture crop of commercial significance (watermelon) with a cropping period of five months; and (3) a more or less annual cereal crop (finger millet).

During the first round of surveys 57 out of 65 farmers had indicated that their preferences for new varieties would depend on the performance of the existing varieties in terms of cost efficiency and productivity. Based on this premise, in the second round, the 65 farmers were confronted with questions on to what extent they would shift to new high quality plant varieties in response to fall in prices and to what extent they would shift to new disease resistant varieties in response to crop losses incurred on account of pests and diseases. By new varieties was meant both hybrid and transgenic varieties. Transgenic varieties were explained to the farmers as hi-tech plant varieties which had superior qualities of product or disease resistance with equal chances of safety risks and inadequate results. These questions were posed with reference to the cost-productivity figures worked out in Tables 1 to 5. The attributes of improved quality mentioned to the farmers during the survey were high sugar and sucrose content for watermelons, 'low caffeine' and 'better organoleptic' properties for coffee and 'improved tasting' finger millets.

The surveys yielded the fact that 17 out of 25 coffee growers cultivating the not-so premium variety of arabica coffee suc[h] as S 288 and S 795 did not favour switch[-]ing over to high-quality, premium yield[-]ing arabica cultivars such as 'Kents' i[n] response to lowering prices. Instead in th[e] wake of a sustained fall in prices in tw[o] seasons their preference was to switc[h] over to the low premium Robusta variet[y] of coffee which could be cultivated a[t] lower costs. These growers indicated [a] distinct preference for high yield, lo[w] disease arabica coffee cultivar to a ne[w] low-caffeine variety (including a trans[-]genic variety). The 25 finger millet grow[-]ers clearly indicated their indifferenc[e] to quality cultivars irrespective of pric[e]

TABLE 5: ARABICA COFFEE: OPERATING COST-PRODUCTIVITY BEHAVIOUR AT DIFFERENT PRODUCTIVITY LEVELS

Output Levels	Output Per Kgs	Cost Per Hectare	Price Per Kg*
1	500	59 31	59.00
2	850	39 50	59 00
3	1,000	37 16	59.00
4	1,100	32.55	59.00

TABLE 1: PRODUCTIVITY PERFORMANCE OF FINGER MILLET: LANDRACES

Critical Levels	Output Per Acre (In Kgs)	Cost Per Acre (Rs)	Cost Per Kg (Rs)	Price Per K[g] (Rs)*
1	375	1570	4.08	4.20
2	600	1600	2.64	4.20
3	800	1645	2.06	4.20
4	1,000	2200	2 20	4.20

Note. * Average price in 1998 for far average quality.

TABLE 2: COST-PRODUCTIVITY PERFORMANCE OF FINGER MILLET HYBRIDS. HR-911 AND GS-64

Levels of Output	Output Per Acre (In Kgs)	Cost Per Acre (Rs)	Cost Per Kg (Rs)	Price Per K[g] (Rs)*
1	800	3,600	4.50	4.50
2	1,200	3,600	3 00	4.50
3	1,350	3,598	2.67	4.50
4	1,800	3,810	2.12	4.50
5	2,500	4,600	1.84	4.50

Note: * Average price in 1998 for far average quality.

TABLE 3: COST-PRODUCTIVITY PERFORMANCE OF WATERMELON – LOCAL HYBRIDS

Local Hybrid	Output Per Acre (In Kgs)	Cost Per Acre (Rs)	Total Cost (Rs)	Price Per K[g] (Rs)*
Level 1	5,000	2 60	13,000	2
Level 2	10,000	1.50	15,000	2
Level 3	15,000	1.00	16,000	2

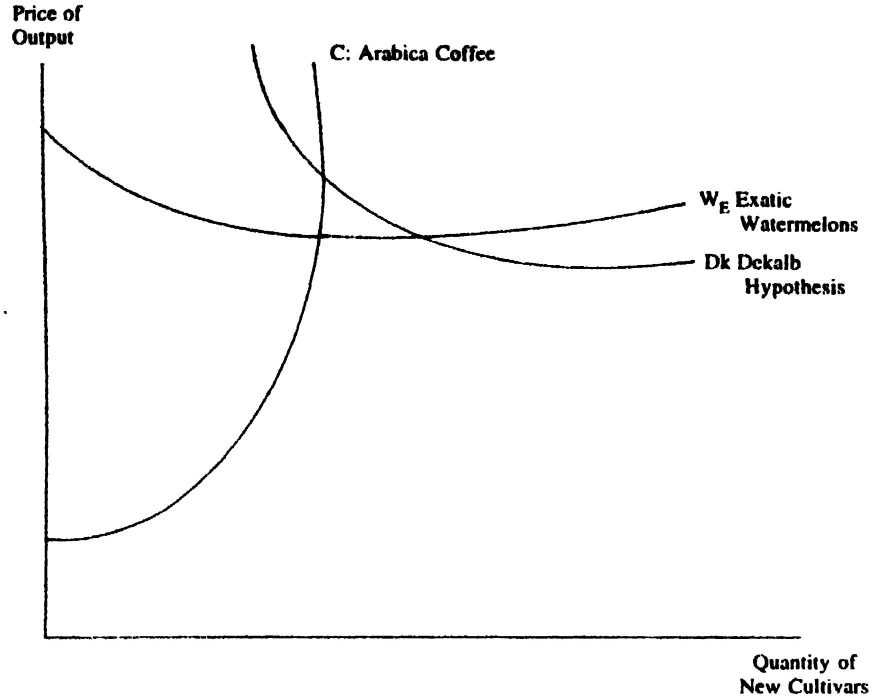
Note: * Average price in 1998 for far average quality.

TABLE 4: COST-PRODUCTIVITY PERFORMANCE OF EXOTIC HYBRIDS OF WATERMELON

Exotic Variety (Hybrid)	Output Per Acre (In Kgs)	Cost Per Acre (Rs)	Cost Per Kg (Rs)	Price Per Kg (Rs)*
Level 1	2,000	17,000	8 5	10
Level 2	5,000	30,000	6 0	10
Level 3	8,000	33,600	4 2	10

Note: * Average price in 1998 for far average quality

Figure 2: Relationship of Price Levels to Demand for New Cultivars with Improved Quality Traits



levels. Farmers cultivating local hybrids (the Indian Institute of Horticulture Research (IIHR) varieties) indicated a preference for shifting to high quality exotic watermelons (such as the Queens hybrid variety from Thailand) in the event of a drop in prices. In other words, it was only the watermelon growers in the sample who subscribed to the Dekalb hypothesis.

The reasons for this complex response pattern to changes in prices can be chiefly explained by Tables 1 to 5. For the arabica coffee growers the margin between costs and prices of coffee at lower levels of output (level 3 and level 2 in Table 5) being low, their sensitivity to sharp fluctuations in arabica coffee prices was high. Therefore they looked for low cost cultivation options. Though robusta coffee prices are lower than arabicas, the preference of these growers to shift to the robusta variety was due to the fact that the cost of cultivation per kg of robusta coffee was lower than the arabica variety by 25 to 30 per cent. In other words, faced with dropping prices, 17 of the 25 sampled arabica coffee growers preferred low cost, low premium coffee variety to a high quality, high premium coffee variety. Of the remaining eight farmers only two indicated preference for planting premium varieties of arabica coffee. The remaining six farmers were neither affirmative or negative in their attitudes to new 'quality' varieties.

As far as the watermelon growers were concerned, Tables 3 and 4 bring out the fact that though the costs of cultivation of local hybrids are lower and output per acre higher, the margins received on crops from local hybrids considerably fell when prices dipped. Therefore all the 10 growers expressed a desire to shift to exotic varieties of watermelons which despite lower productivity and higher costs of production enjoyed higher, and more importantly, stable prices in comparison to local hybrids.

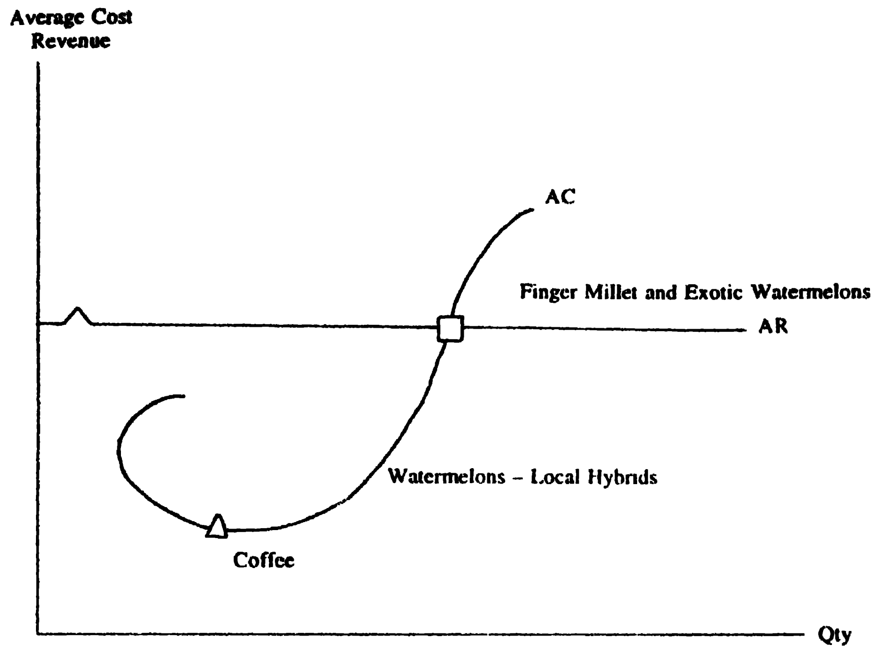
As far as finger millets were concerned the costs per acre for the local landraces being low and the crop being largely subsistence based, there was no desire to shift to new, high quality varieties even if prices fell. Even amongst the 10 farmers exclusively cultivating local hybrids, there was no definite preference for quality varieties for the fear that they would lose out in terms of 'productivity' and 'cost competitiveness' associated with hybrids.

The same sample of 65 farmers[5] (all of them in the medium farmer category)[6] were interviewed on their demand for new, exotic disease-resistant varieties, including transgenic varieties, during the second round of surveys. The disease resistance parameter was taken up for survey, considering the fact that disease resistance has been the major focus of transgenic research both by companies such as Monsanto as well as national research institutes such as the IARI (for brinjal and tomato) and the Central Coffee Research Institute (for transgenic arabica coffee varieties). The growers cultivating the long duration (30 – 40 years) arabica coffee were inclined to switch over to disease resistant varieties if they hit output per land unit area below level 3 for two continuous seasons. For the watermelon growers raising exotic varieties, a fall in output due to diseases (such as collar rot) even to level 1 was put up with unless the crop loss was continuously experienced for more than four seasons in a row. This was because growers cultivating exotic watermelons avoided shifting to any new disease resistant variety for fear of losing premium prices associated with exotic watermelons. The watermelon cultivators cultivating local hybrids indicated a clear preference for either shifting to exotic watermelons or to alternative disease-resistant varieties if level 2 productivity obtained continuously for two seasons and provided these varieties are not expensive to obtain.

The reasons for these inter-crop differences in the matter of demand for new cultivar could be attributed to the following factors. Coffee being a perennial crop, with a gestation of five years for cropping and life-span of 50 year, cost is the major economic consideration. The preference for alternative plant material was crucially guided by the average cost of production. Diseases such as leaf rust and white stem borer which have adverse impacts on crop productivity and on average costs were viewed as risks to be avoided under all circumstances even if it meant adopting a new variety with uncertain biosafety prospects and economic outcome.[7] For native hybrid watermelons, the high sensitivity to crop losses on account of the diseases was the poor margins experienced by growers in the event of crop loss due to diseases. In the case of exotic watermelons, growers were reluctant to shift to alternative disease resistant varieties unless crop losses were continuously incurred. In the case of finger millet, being subsistence based, increase in average costs from level 4 to 2 for local landraces was not a great incentive to shift to a disease resistant variety unless the fall was continuously experienced for more than three seasons.

In general, the surveyed farmers did not indicate any special preference or abhorrence towards transgenic varieties. This could be because that the dangers of transgenic products had not sunk in. However the small sample cited here very well serves to depict the fact that even within a small sample there could be wide variations in demand patterns for new cultivars. Indeed farmers can show wide

Figure 3: Cost Sensitivity to Crop Loss and Demand Pattern for Disease Resistant Varieties: All Illustration



differences in their attitude to risk aversion and could be employing a complex calculus of setting the risks of crop failure and price fluctuations *vis-a-vis* the risks likely to arise from cultivation of hitherto unknown, 'new varieties'. In such circumstances of 'demand incoherence' to presuppose that giant plant biotechnology companies with their oligopolistic features can enforce oligopolistic pricing for their products in India may not be a valid assumption to make. Rather, it would be safer to assume that 'demand' factors being highly uncertain and unpredictable for Indian agriculture, these companies wielding advanced 'transgenic' products may have 'flatter' average revenue curves to begin with, until such time that the demand gets conditioned to the economic behaviour theories propounded by Dekalb et al.

Similarly demand for new varieties of commercial crops and vegetables (which form the focus of international plant biotech companies) need not be more inelastic than those of cereals which generally are supposed to be the focus of national plant biotechnology firms. Thus the demand incoherence for improved or new varieties of plants in general and for transgenic plants in particular could by itself act as a safeguard against the oligopolistic tendencies of international companies.

The demand patterns for new varieties of plants including transgenic plants in response to changes in prices and crop losses are illustrated in Figures 2 and 3 for the four crops in the sample, in relation to the Dekalb hypothesis.

A larger sample of farmers, drawn from multiple strata, can better indicate the vagaries of the market place for new varieties of plants and seeds and help better assess the severity of the barriers to entry for improved strains of cultivars including genetically modified ones.

III
Policy and Law Framework for Transgenic Plants

There are other factors which can serve as regulation entities for advanced plant biotechnology companies in the Indian situation. These stem from the framework of policy and law revolving around the Plant Varieties Protection Act, the Biosafety Regulations, the Seeds Act and the proposed bio-diversity legislation. This framework provides adequate safeguards to check the oligopolistic tendencies associated with the integration processes as illustrated in Figure 4. However despite these advantages much remains to be done in the matter of giving teeth to the framework in terms of effective controls.

TRIPS and sui-generis legislation in India: The WTO Agreement on TRIPS specifies patentable subject matters. Article 27(1) of the TRIPS states that patents shall be available for any invention, whether products or processes in all fields of technology provided they fulfil the criteria of 'novelty', involve an 'inventive step' and are 'capable of industrial application'. The terms 'inventive step' and 'capable of industrial application' could be considered as synonymous with the terms 'non-obvious' and 'useful' respectively. Article 27(2) of the TRIPS states that members may exclude from patentability 'inventions' which may be necessary in order to protect public order or morality or human/animal/plant life or the environment in their territory. Article 27(3) of the Agreement lays down that members shall provide for the protection of plant varieties either by patents or by an effective sui-generis system or by any combination thereof.

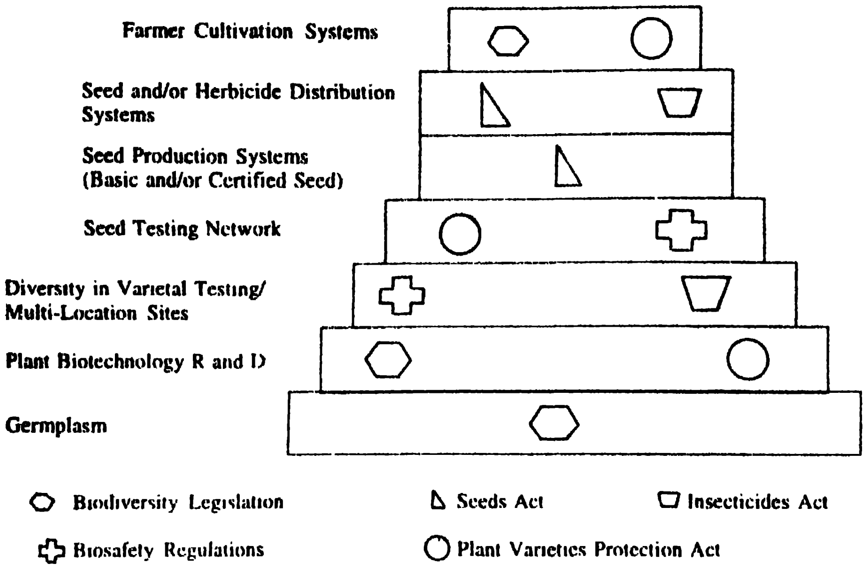
Article 27(3) in particular is critical to India as this requires us to provide protection of plant varieties by conferring plant breeders rights either by way of patents or through a sui-generis plant variety protection legislations. Countries with strong R and D base in plant genetic engineering such as the US have robust plant patent legislations. India is certainly not inclined to adopt patent protection regimes for its plant varieties. India is rather inclined to adopt sui-generis legislation which is non-'patent' based. There are many reasons for this proclivity.

India is one of the 10 mega-diversity countries of the world and a rich storehouse of landraces of principal agricultural crops. India has a strong R and D base in conventional plant breeding methods. Its strength in plant genetic engineering is impressive but not an overwhelming factor by comparison. The first two strengths explain India's disinclination towards plant patent regimes or towards a sui-generis legislation which is 'patent'-driven. Today in India, difference of opinion is not as much on the desirability of plant variety protection as on the structure of the sui-generis legislation.

Broadly one sees two schools of thought in India in regard of sui-generis plant variety protection. One school of thought favours the adoption of a UPOV model of plant varieties protection, while the second school advocates a non-UPOV framework for protection of breeders' rights [Sahai 1996] which could also uphold rights of local communities conserving the germplasm which forms the foundations of protected plant varieties.[8] The second school of thought is associated with the green movement in India [GRAIN 1990 and Shiva et al 1998].

India's reservations about plant patents and plant utility patents leaves it with the option of going in for a sui-generis option which could be modelled on the following: (1) UPOV-1978 with rights conferred on farmer conservators of germplasm,

Figure 4: Policy-Law Checkpoints in India for Regulation of Plant Biotechnology Including Transgenic Plants at Various Segments of Vertical Integration



mainly in the form of right over landraces; and (2) UPOV-1991 without necessarily restricting 'farmers privileges' breeder exemption. By ruling out plant patents and plant utility patents and further by adopting the DUS criterion (distinctiveness, homogeneity and stability) as the basis for confirming protected variety status, India has shown its inclination for modelling its PVPA legislations on UPOV lines if one goes by the draft PVPA Act currently being circulated. Even in UPOV, India prefers the less stringent version of UPOV 1978, whereby plant breeder rights are conferred only over 'reproductive' and vegetative propagating materials of the protected variety.[9] The clause of compulsory licensing in the draft PVPA acts as a further safeguard in preventing misuse of rights conferred on protected varieties.

In addition, the ICAR has notified its morphometric methods of determining DUS (in accordance with the UPOV guidelines for the conduct of tests for DUS). It is argued that morphometric measures mask genetic distance. Conversely there could be situations where genetic transformation maybe 'cosmetic' or 'commercially' irrelevant with, may be, virtually no alteration in morphometric properties. The features of policy, law and testing methods being adopted by India have the scope of blunting the oligopolistic edge of transgenic technology. This will be particularly true of those transgenic plants which have only a few characteristics changed due to genetic engineering and which may not necessarily get reflected in morphological or physiological features such as growth, flowering habit, size of the stems and branches or colour amongst others. Plant patent or plant utility patent regimes in conjunction with molecular marker systems for determining varietal identity could give considerable latitude for transgenic plants with narrow genetic distances to qualify for protection.[10] Our core policy and law on protected plant varieties thus does not confer appreciable benefits of protection to transgenic varieties.

Biosafety Guidelines: India does not have a biosafety legislation. However a mechanism has been set up under the department of bio-technology based on a three tier mechanism to look into safety aspects of transgenic plants. These relate to: (1) the Institutional Bio-Safety Committee (IBSC) whose clearance is a must for any research institute undertaking transgenic research; (2) the Review Committee on Genetic Manipulation (RCGM), a national committee with mandate to monitor national research in India in GMOs; and (3) a genetic engineering approval committee based in the ministry of environment and forests with authority to approve commercial use of GMOs and re-combinant DNA products. These safeguards apart, the establishment of two transgenic containment facilities by the ICAR and the department of bio-technology in 1999, could provide operational infrastructure for biosafety.

Seed policy: The drought of 1987-88 in India, coupled with imbalances in crop productivity for select categories of cereals and pulses catalysed the introduction of the New Policy on Seed Development (NPSD) in 1988. This policy of liberalised import of high quality seeds which in conjunction with the general economic liberalisation regime has opened the Indian seed market to foreign seed producers. The ostensible strategy of the NPSD is to ensure that farmers in India are exposed to quality seeds from a wide variety of sources including international sources. However transgenic plants and seeds bring about problems in the form of sanitary and phyto-sanitary related diseases and pests. The NPSD provides for upgrading of plant quarantine facilities for imported seeds to tackle the sanitary and phyto-sanitary related measures. In addition to these safeguards the NPSD 1988 requires samples of transgenically developed new seeds to be supplied to the India Natural Gene Bank maintained by NBPGR [Sidhu et al 1997]. This is particularly significant for transgenic varieties based on Indian germplasm as is the case of B_t Cotton variety being field tested in India under the Monsanto-Mahyco Joint Venture (JV). If one reckons with the fact that the B_t cotton variety being field tested in India has been designed for Indian conditions having been developed after backcrossing of the B_t gene into India cotton germplasm, the NPSD requirement will serve to considerably strengthen the proposed biodiversity legislation in India.

The proposed biodiversity legislation: The draft outline of India's biodiversity act[11] circulated for public discussions during July 1998 is based on prior informed consent principle to regulate obtaining of biological resources by body corporates or organisations not registered in India or those registered in India with non-Indian citizen participation in equity or management either for research or for commercial utilisation or bio-prospecting. This provision, if brought into effect in the final act could act as another check point on vertical integration tendencies of international bio-tech companies which either directly operate or work through joint ventures with Indian companies in the country.

Figure 4 sums up the policy legal framework required to tackle the oligopolistic tendencies of transgenic plant from horizontal and vertical integration.

IV
Future Directions for Policy-Law Framework

The basic policy and legislation framework notwithstanding, the operational aspects leave much to be desired. Finer articulation of these policies and laws and

concerted direction in the matter of implementation of the policy-law framework is crucial for regulations on transgenic plants to be effective in India. As mentioned at the outset, a narrow biosafety focused regulatory system will not achieve the purpose of securing social, economic and political equity. The PVPA legislation and the systems of varietal identification being set up in India are on the right track if the presumptions outlined in the earlier sections are correct. The temptation to use molecular markers may be high. However it is advisable for India to go in for markers as variety identification techniques in place of morphometric methods only if its utility and reliability is proved beyond doubt. This cautious approach is extremely important to avoid tendencies of cosmetic breeding and conferment of plant breeders rights over what may be 'cosmetic breeds', transgenic or non-transgenic. In addition, molecular marker techniques such as RAPD are high cost options. However molecular markers may find better application in accelerating backcrossing under conventional plant breeding as they allow selection of individuals with more of recurrent genomes at each cycle and facilitate conventional plant breeding systems to be completed in a shorter cycle [Henry 1997].

The PIC procedures under the biodiversity legislation need further articulation to cover cases of transgenic plants developed in India based on germplasm maintained ex-situ by the Indian partner in a JV collaboration. The aspect of access to biological resources in the proposed bio-diversity legislation should squarely include ex-situ collections of agro-germplasm maintained by both public and private seed industries. This could act as a check on backward integration processes involving control over germplasm by foreign bio-tech companies through JVs with Indian partners.

As far as the seeds legislations are concerned there is need to bring in the criterion of value for cultivation and use in India (VCU) in addition to the DUS at the cultivar stage. This is because the VCU with its requirements of denoting a clear and distinct improvement over existing varieties[12] in the matter of commercial application, could act as a check on cosmetic breeds that may fool the PVPA legislation and graduate to the seed registration phase. Similarly the biosafety regulation while seemingly well structured is placed on a relatively weak foundation in its environment impact assessment (EIA) dimension. Apart from proving the protection criteria (DUS) for transgenetic varieties and their commercial viability it is also necessary to carefully assess the biosafety of these crops from the EIA angle. Particularly daunting will be the task of reconciling the conventional parameter of 'expression of foreign gene' for according DUS to a transgenic plant with that of 'control of plant gene expression' that forms the basis of the terminator gene in crops of commercial importance. This will require far more elaborate protocols. Perhaps the introduction of clauses on regulations of living modified organisms (LMOs) in the final version of India's bio-diversity legislation could be the first step in the direction of strengthening India's biosafety regimes in terms of the environment impact assessment angle.[13]

To sum up, transgenic plants require to be regulated for more than one reason. The dangers of economic domination posed by transgenic plants and advanced genetic engineering technologies are as important as the biosafety factor. India has certain natural checks by way of incoherent market structures for new plant varieties including transgenic plant varieties. It is difficult to secure oligopolistic pricing for new varieties of plants in India unless a high degree of market awareness is mobilised by plant biotech companies to overcome the 'barriers to entry'. India has also a legislation framework which is composite and good enough to regulate transgenic plants and their inherent economics at multi-levels. However critical gaps need to be addressed if these laws are to have any practical meaning or effect.

Notes

1 For a recent report on the fall in the value of Monsanto stocks by 30 per cent and the lay-off of 9 per cent of its global workforce see Khurana et al (1999). This story indicates that integration processes as a strategy of leveraging economic advantage may not always meet with unqualified economic success.

2 Indira Khurana et al, op cit, mention about media reports on the poor performance of Monsanto's B_t cotton crop in the US in 1996 which was allegedly attacked by bollworn, and the boll damaged to roundup cotton in the 1997 season

3 In the US between 1987 and 1996, 2000 field trials of transgenic plants had been conducted As John Smith (1996) notes, while it would appear that transgenic plants do not look or behave widely differently from ordinary crop plants, there have been some concerns expressed that contained conditions of the field trials do not adequately mirror the real field situations and some potential environmental hazards could be missed which will show up only after release. The recent outburst in UK and India show that concerns about the negative effects are more vocal now than in the past.

4 John Hemingway, Dekalb product manager for quality and special traits, in a chat with Dow Jones, New York on September 4, 1998 was euphoric when he stated, "In a year with low commodity prices, we are finding there is a lot of farmer interest in a product that gets them a 25-cent premium over today's $ 2 corn". And he continued, "If corn were $ 4 today, the premium would not loom so large". Hemingway gets support from Scott Smith, a senior buyer in commodity purchasing at Quaker Oats who states, "We've been buying special crops for a long time to use in grits, corn meal and Cap'n'Crunch cereal Just now farmers are getting a clue With terribly low commodity prices today, any premium looks good and that is growing this business. Plus, you don't need to be as good a manager or as precise to grow these crops as you do with No 2 corn because of the premiums they pay."

5 Though the sample size of 65 is small, it is significant as an indicator of economic behaviour underlying farming operations in India. The standard deviation is not marked for the sample insofar as costs per unit of product is concerned The standard deviation of cost per kg for the lowest and highest output level per kg of produce (as indicated by the growers in the second round of survey, when confronted with the figures in the tables), ranged from 0.29 to 0 4 for levels 4 and 1 respectively in regard to landrace varieties of finger millet and from 0 13 to 0.68 for hybrid varieties of finger millet for levels 5 and 1 respectively The standard deviation of cost per kg for non-exotic watermelons ranged from 0 05 to 0 12 for levels 3 and 1 respectively and for exotic watermelons from 0.38 to 1.11 for levels 3 and 1 respectively. For arabica coffee the standard deviation of cost per kg ranged from 3 48 to 10 14 for levels 4 and 1 respectively In other words, the deviation from the average cost per kg figures presented for the highest and the lowest level of output is negligible and the sample is accordingly not infirm

6 By 'medium farmer' is meant farmers cultivating between 5 and 10 acres of agricultural cereals or horticultural crops or farmers with holdings between 10 hectares to 25 hectares cultivating plantation crops such as coffee In other words the category of 'medium farmers' employed here is sector-specific and not 'social' in connotation. There is no effort to argue here that the medium farmer growing coffee and the medium farmer cultivating cereals and horticultural crops are on the same economic plane The focus on medium farmers for the study and the survey was deliberate as the purpose was to work out cost-productivity analysis and demand patterns for new plant varieties, not characterised by extreme biases associated with scale or size of holdings.

7 It may be interesting to note that the thrust of plant breeding efforts in India's coffee sector has been basically in the direction

of developing varieties resistant to leaf rust diseases. White stem borer which is a major disease affecting arabica coffee has not been a major focus of plant breeding efforts of the CCRI. Unfortunately this is one disease which coffee growers view as a capital loss, as the coffee bush is irretrievably lost. In recent times the Coffee Board has been more vocal about developing transgenic arabica varieties which are immune to the white stem borer. A case in point has been the emphasis on transgenic research in the recent address of S V Ranganath, chairman, Coffee Board at the Karnataka Planters' Association meeting in Bangalore in November 1998.

8 For a slightly different critique 'of the soft option illusion' of UPOV 1978 see Damodaran (1998b).

9 By comparison the UPOV 1991 provides plant breeder rights over propagating material and where required over harvested' material. The authorisation of the breeder will be required in respect of harvested material in case there has been unauthorised use of the propagating material by way of unauthorised marketing or export, etc. Harvested material as defined in UPOV 1991 can include the entire plant or parts of the plant. See for further discussion Damodaran (1998a)

10 See Henry (1997) for a comprehensive account of molecular markers such as Random Amplified Polymorphic DNA (RAPD) or Restriction Fragment Length Polymorphisms (RFLP) and their fine tuning effects in the matter of genetic distance. If 'd' is the neighbourhood range of an extant variety Z_t and as per morphometric methods $Z_t = (x - \delta, x) \cup (x, x + \delta)$, then the neighbourhood range or genetic distance that could be fine tuned and laid down by molecular markers such as RFLP or RAPD as Z_{tt} where Z_{tt} could be $(x_t - \delta/2, x) \cup (x_t, x_t + \delta/2)$. This clearly serves to indicate the extent to which molecular markers can distinguish varieties within a narrow genetic distance and perhaps satisfy the DUS criteria. Unfortunately the methodological reliability of these markers is suspect and besides these techniques are at times more costly to apply for establishing varietal distinctions.

11 Anonymous (1998) refers to the draft biological diversity act circulated by the ministry of environment and forests for discussions with the NGOs.

12 For the operation of the VCU system in Europe see Kelly et al (1998) and the complications created by VCU criteria for UPOV see Leskein (1997). The spirit of proposing VCU criteria is on the assumption that India has a PVPA which is 'sui-generis' and which is only 'modelled' on the UPOV 1978 version.

13 The aspect of biosafety is not the major focus in this article. For some considered views on biosafety dimensions of genetically engineered organisms and transgenics see Kesavan (1997) and Gurumurti Natarajan (1997) amongst others. The trade angle of biosafety is considered in Damodaran (1999).

Rural Infrastructure and Growth in Agriculture

M S Bhatia

This paper attempts to build a composite index of rural infrastructure statewise and examines the relationship between infrastructure development and levels of production and growth in agriculture.

ADEQUATE infrastructural support is a pre-requisite for accelerated economic development. Infrastructure comprises all those activities and facilities which help to sustain the growth in production and income generation in the rest of the economy rather than production and income generation within the infrastructure enterprises themselves. It is an umbrella term for many activities referred to as 'social overhead capital' by such development economists like Paul Rosenstein-Rodan, Ragnar Narkse, and Albert Hirschman. Rural infrastructure is said to strengthen the foundation of agriculture which is a pace setter of our economic growth. The *World Development Report* (1994) which focuses on infrastructure for development brought out a strong positive relationship between the level of GDP and infrastructure stock per capita. Good infrastructure helps in raising productivity and lowering the unit cost in the production activities of the economy. The pay-off from better infrastructure services go beyond reducing technical inefficiencies and financial losses [Gowda and Mamatha 1997].

In a developing economy like India, infrastructural facilities are generally weak and inadequate. Many people, especially the rural poor, and areas do not have access to even minimal infrastructure services. If the nation aspires to attain maturity in economic growth, it must give a big push to the upliftment of the network of physical infrastructure like energy, transport, etc. The importance of a strong infrastructure has been well-recognised by the government. The united front in its *Common Approach to Major Policy Matters and Minimum Programme*(1996) observed that "Investment in infrastructure has to be stepped by from the present 3.5-4.0 per cent to atleast 6 per cent of GDP in the next few years". It also observed that the economy could grow and the needs of the people could be met without more capacity in power, oil, telecom, railways, roads and ports. The commulative requirement of these sectors over the five years 1996-2000 was then estimated to be above Rs 7,00,000 crore. In view of the large financial requirement, the government acknowledges that the state and public investment have a leading role to play in the development of infrastructure. The government of India appointed an Expert Group under the chairmanship of Rakesh Mohan to consider issues relating to commercialisation of infrastructure projects which submitted its report in June 1996. The group has defined a role for private public participation in the required infrastructure and recommended that the government could adopt the venture capital route where the government could initially be the major share holder and upon completion and attaining viability of projects, it could disinvest and invest elsewhere. As a follow-up of the report, the Infrastructure Development Finance Company (IDFC) has been set up to promote infrastructure investment with the central government and the Reserve Bank as chief contributors to its share capital [RBI 1996-97]. The *National Agenda for Governance*, 1998 has also indicated infrastructure development as a thrust area particularly energy and power sectors for recommencing public expenditure in this sector, which would increase access to long-term funds in the national and international markets, remove administrative bottlenecks and reverse the slowdown in this critical area of national economy. The adequacy of infrastructure helps to determine the states success or failure in agriculture in terms of level of production and diversifying the sector. Although precise linkages between infrastructure and development are still open to debate, the experience across the world has shown that increase in stock of infrastructure is associated with the increase in output accross the countries. As countries develop, infrastructure must adapt to support the changing patterns of demand as the share of power, roads, telecommunication in the total stock of infrastructure increases relative to the basic services such as irrigation, etc.

The present paper aims at examining (i) the pattern of development of rural infrastructure in India over the years; (ii) regional variations in availability of rural infrastructure facilities; attempts (iii) to build composite index of rural infrastructure statewise and; examine the relationship between infrastructure development and level of production and growth in agriculture.

The major items of infrastructure as identified in the planning process include irrigation, power, transport, communication, education, health, etc. Within these major heads, there are sub-items of rural infrastructure which have direct bearing on agricultural development. For example, it is not only the total power availability in the states, but equally important is its access to the villages and then to the agriculture. Similarly, source of irrigation is equally important as the irrigation itself. The major sub-items of infrastructure include (i) proportion of villages electrified; (ii) percentage of power used in agriculture; (iii) percentage of irrigated area; (iv) intensity of tubewells; (v) density of rural roads; (v) intensity of transport vehicles; (vii) fertiliser sale depot; (viii) rural credit as reflected by intensity of rural commercial banks; (ix) rural health as reflected by intensity of beds in rural hospitals; (x) rural infant mortality rate; (xi) intensity of wholesale markets; (xii) storage facilities; (xiii) intensity of agricultural extension workers; and (xiv) agricultural research/scientist.

Power, irrigation, transport, communication, education, health, etc, are the major items of infrastructure which have received special attention in the development planning of the country. The relative importance of these items has been changing over different plan periods. The details of plan expenditure by heads of development during the period Third Five-Year Plan (1961-66 to 1995-96) are shown in Table 1. An examination of Table 1 shows that in the early developmental plan periods, i e, Third and Fifth Five-Year Plans, expenditure on infrastructural items accounted for about 56 per cent of the total. However, thereafter, a proportion of the expenditure on infrastructural heads has decreased to almost 49-50 per cent. Further the relative importance of different items, has also been changing during the different plan periods. As has happened in developing countries with the growth in the economy, the demand pattern has changed in India also which called for greater allocation of funds for development of transport, communication, education, etc, in the total

stock of infrastructure and the relative share of expenditure services like irrigation has decreased. The proportion of expenditure on irrigation and flood control which was 9.8 and 10.0 per cent during Fifth and Sixth Five-Year Plan periods, has declined to 7.6 per cent in Seventh Plan and then to 6.0 per cent in the Eighth Five-Year Plan period. The share of expenditure on transport which was in the range of 16-17.4 per cent during the period 1974-75 to 1989-90, has gone up to about 21.5 per cent in the Eighth Five-Year Plan period of 1992-93 to 1996-97. Power continues to be an important item of the infrastructure as expenditure on this item has remained in the range of 16.0 – 18.0 per cent of the total in various plan periods except in certain years. However, during the Eighth Five-Year Plan period relative expenditure on this item (energy) has been slightly reduced.

With the large-scale plan expenditure of the government, the availability of infrastructure has significantly expanded in the country over the years. The growth in the stock of major infrastructure items in India has been shown in Table 2. Table 2 shows that the stock of infrastructure has expanded manifold in the country in the last 46 years of planned developemnt. The electric power generation has increased almost 75 times from 56.1 billion kwh in 1950-51 to about 3890.0 billion kwh in 1995-96. Fertiliser production in the country has increased from 0.50 lakh tonnes to over 117 lakh tonnes, whereas irrigational facilities have increased from 22.50 million hectare to 70.25 million hectare during the same period of 1950-51 to 1995-96. These are three important physical items of infrastructure significantly influencing production and growth in agriculture. Equally important is the marketing infrastructure including roads and transport, storage and market facilities which provide impetus to agricultural production growth through orderly disposal. While road lengths have increased to seven times, the commercial vehicles in the country have increased to over 19 times from 1.16 lakhs to 22.21 lakhs during 1950-51 to 1995-96. Similarly the number of regulated markets in the country have increased from 206 to 6,836 during the same period.

There are some other items of rural infrastructure such as rural health, agricultural extension workers, agricultural research, etc, which have significant bearing on the growth of agricultural economy. Although details of stock of these items over years are not readily available, there has been a significant growth in these items that has helped in strengthening the production base of Indian agriculture.

Spatial Variations in Rural Infrastructure

The expansion in physical infrastructure requires large and continuous investment and hence its availability in different states depends upon the relative priority accorded by the state governments. Although it would have been appropriate to analyse the statewise expenditure on different items over the years, due to constraints of availability of data and resources it could not be attempted here. However, it would be of interest to study the existing level of infrastructure in different states. The level of basic infrastructure items in different states as per 1994-95 statistics are shown in Table 3. An examination of this table shows that as far as availability of power in rural areas is concerned, all villages have been electrified in Andhra Pradesh, Gujarat, Haryana, Himachal Pradesh, Karnataka, Kerala, Maharashtra, Punjab and Tamil Nadu. However, the percentage of villages with power facilities as low as in the range of 71-76 per cent included the state of Bihar, Orissa, Uttar Pradesh and West Bengal. The proportion of power used for agriculture is highest in Haryana as 49.5 followed by Punjab and Andhra Pradesh with 44.27 and 40.25 per cent respectively. This proportion is as low as 2.34 in Assam, 2.76 in Himachal Pradesh, 4.05 in Kerala 4.83 in Orissa and 6.96 in West Bengal.

As far as the irrigational infrastructure is concerned, the percentage of net irrigated area is highest in Punjab with 93.3

Note: Figures in brackets show percentage to total.

Table 2: All-India Expanded Stock of Infrastructure

	Power Generation Billion Kwh)	Irrigated Area (Million Hect)	Fertiliser Production (Lakh tonnes)	Road Length (000 Km)	No of Commercial Vehicles (Lakh)	Registered Medical Practioners (in 000 Person)	Number of Regulated Wholesale Market
1950-51	5.1	22.56	0.50	400.0	1 16	61.39	206
1960-61	16.9	27.98	1.50	524.0	2.25	83.45	715
1970-71	55.8	38.19	10.59	918.0	4.37	153.50	1777
1980-81	110.8	49.73	30.05	1491.0	7.01	266.49	4158
1990-91	264.3	62.47	90.45	2037.0	17.44	397.76	6250
1995-96	380.0	70.25	117.03	2884.0	22.21	491.40	6836

followed by Haryana and Uttar Pradesh with 75.6 and 65.6 respectively. The proportion of net irrigated area is also higher than the all-India average of 35.2 per cent in the states of Andhra Pradesh, Bihar, Jammu and Kashmir, Orissa, Tamil Nadu and West Bengal. The proportion of irrigated area is lower than the all-India average in the states of Assam, Gujarat, Himachal Pradesh, Karnataka, Kerala, Madhya Pradesh, Maharashtra and Rajasthan. The related important item of physical infrastructure is the intensity of tubewell in the state as it is considered as assured means of irrigation water. The intensity of tubewell as reflected by the number per hundred hectares of area, is highest in Punjab followed by Andhra Pradesh, Kerala and Haryana. The tubewell intensity is very low in Assam, Jammu and Kashmir, Orissa, West Bengal, Rajasthan, Tamil Nadu and Bihar where as it is moderate in Karnataka and Maharashtra.

Besides irrigation, the other most important input for raising agricultural production is the easy availability of fertilisers. The intensity of fertiliser sale depot as indicated by the number per thousand hectares is an important indicator of fertiliser availability. The intensity of fertiliser depo is lowest in Rajasthan as 0.42 per thousand hectare. The next lowest intensity of fertiliser depot is in Madhya Pradesh with the number being as 0.75. The fertiliser distribution net work is also relatively weak in Andhra Pradesh, Gujarat, Karnataka and Maharashtra and farmers in these states have to travel long distances to get fertilisers. The intensity of fertiliser sale network is moderately reasonable in the states of Assam, Bihar, Haryana, Orissa and Punjab where number is in the range of 1.7-2.0 per 1,000 hectares of crop area. This network is quite strong in the states of Kerala, Tamil Nadu, Uttar Pradesh and West Bengal besides Himachal Pradesh and Jammu and Kashmir.

The other important aspect of physical infrastructure is the proper and adequate facilities for upgradation and development of new technology in the field of agriculture. This could be measured in terms of intensity of agricultural scientists in the state. The country has agricultural

TABLE 4: WEIGHTING DIAGRAM FOR CONSTRUCTION OF INDEX OF INFRASTRUCTURE

Major Item		Sub-Item	Weight

All-India	84.0	28.20	35.2	7.0	62.1	108.66	1.81	4.23	96.8	105	2.4	21.4	95.4	155

scientists either in the ICAR system spread over in different areas through its research institutions or in the state agricultural universities. The average number of agricultural scientists per million hectare in the country was estimated at 155. This number is much higher than the all India average in the states of Assam, Haryana, Jammu and Kashmir, Karnataka, Kerala, Punjab and Tamil Nadu which showed well developed agricultural research infrastructure in these states. However, the number of agricultural scientists per million hectare are much lower in the states of Madhya Pradehsh, Jammu and Kashmir, Rajasthan, West Bengal and Orissa and moderately lower in Bihar, Gujarat and Maharashtra.

It is not only the development of technology but equally important is the infrastructure required to spread the available scientific information and technology amongst the large number of farmers, which require adequate number of agricultural extension workers. The average number of agricultural extension workers which includes village level workers as well as subject matter specialists at the district and regional levels was estimated at 95.4 per million rural population. This number is highest in Punjab (293) and lowest in Uttar Pradesh (26). The intensity of agricultural extension workers is relatively high in of Himachal Pradesh, Karnataka, Madhya Pradesh and Orissa whereas it is reasonably good in the states of Assam, Gujarat, Haryana, Karnataka, Rajasthan and Tamil Nadu. Agricultural extension is relatively weak in Bihar, Kerala, Uttar Pradesh and West Bengal.

Use of yield increasing modern inputs and technology in agriculture is usually capital intensive which require large financial resources on the part of the farmers. Farmers are usually constrained to use modern inputs and technology if availability of credit is not adequate. Institutional credit is the most economical and intensity of financial institutions particularly rural commercial banks is an important parameter of credit infrastructure. The intensity of rural commercial banks as reflected by the number per lakh of rural population is highest in Himachal Pradesh being 12.38 followed by Jammu and Kashmir and Punjab with number as 8.31 and 7.24 respectively. The number of rural commercial banks per lakh of rural population is above average in the states of Andhra Pradesh, Gujarat, Haryana, Madhya Pradesh, Orissa and Rajasthan. The credit infrastructure is weak in the states of Assam, Bihar, Kerala and West Bengal and moderate in the states of Gujarat, Maharashtra, Tamil Nadu and Uttar Pradesh.

Infrastructure of roads and transport is important for the procurement of inputs and disposal of farm output. The intensity of road as measured by the length of road per 100 sq km is highest in Kerala with 356.7 km followed by Tamil Nadu, Orissa and Punjab with the road length as 152.3, 126 and 107.8 km per 100 square km respectively. The intensity of road is also higher than the all-India average of 62.1 km per hundered sq km in Assam, Karnataka, Maharashtra, Uttar Pradesh and West Bengal. However intensity of road is very low in Jammu and Kashmir, Rajasthan and Madhya Pradesh whereas it is moderate in Haryana, Bihar, Andhra Pradesh and Gujarat. As far as availability of transport indicated by the number of commercial vehicles per 100 sq km, it was highest in Kerala with number as 462 followed by West Bengal, Tamil Nadu, Punjab, Gujarat and Haryana. The intensity of transport vehicle is lowest in Madhya Pradesh with number as 23.6 per 100 sq km of area. The other states which have intensity of transport vehicles as low as almost half of the all-India average of 108.6 includes those of Himachal Pradesh, Jammu and Kashmir, Orissa, Rajasthan and Uttar Pradesh.

Agricultural production system cannot be healthy unless it is supported adequately by the strong market infrastructure for disposal of farm produce. Intensity of market structure has been measured in terms of number of wholesale markets per thousand sq km and storage facilities as proportion of total foodgrain production in the state. The intensity of wholesale markets is highest in Punjab followed by Kerala and Haryana. However market infrastructure is very low in Himachal Pradesh, Jammu and Kashmir, Orissa, Rajasthan and Madhya Pradesh whereas it is moderate in other states. As for storage facilities as reflected by the capacity in percentage of total production of foodgrains is concerned, it is very good in the states of Punjab, Kerala, Gujarat, Haryana, Andhra Pradesh and Maharashtra. Storage facilities for foodgrains are very low in the states of Bihar, Himachal Pradesh, Jammu and Kashmir, Orissa, Karnataka, Uttar Pradesh, West Bengal and Assam and are moderate in other states.

Productivity of agricultural workers is, to a large extent, influenced by the health of the rural people besides the means of production. The health of the people, however, in turn is influenced by numerous factors affecting level of living. The most common yardstick of health infrastructure

TABLE A

(i)	Village Electrified	: In proportion of the villages electrified.
(ii)	Percentage of power used for agriculture	: Full score to the states having percentage share equal to or higher than all-India average and for others in proportion to the all-India average.
(iii)	Percentage of irrigated area	: In a proportion to the percentage of area irrigated in the state
(iv)	Intensity of tubewell	: Optimum number of tubewells per hundred hectare of crop area is considered as 20, and states were assigned score accordingly in proportion of their number.
(v)	Fertiliser sale depot	: Optimum number considered is three per thousand hectares of crop area.
(vi)	Rural credit	: Desirable/required number of rural commercial Banks for per million population is taken as 10.
(vii)	Road length	: Against the all India average of 62 km per 100 sq km, 100 km per 100 sq km road length was taken as normal requirement.
(viii)	Transport vehicles	: Optimum number of transport vehicle was considered as 200 against existing average of 108.6 per 100 sq km.
(ix)	Wholesale market	: Optimum number of wholesale markets was taken as 5.0 against existing all India average of 2.4 per 100 sq km.
(x)	Storage facility	: Optimum requirement was considered as 40 per cent of the total production of foodgrains in the state.
(xi)	Agricultural Research	: Desirable number taken as 200 against the all-India average of 153 agricultural scientists per million hectares of crop area.
(xii)	Agricultural Extension Workers	: Desirable number taken as 250 extension workers against the all-India average of 95.4 per million rural population
(xiii)	Rural Health	: Desirable minimum required number of rural hospital beds was taken as 150 against the existing all-India average of 96.8 per million rural population.
(xiv)	Rural Infant Mortality rate	: Desirable/optimum level taken as 50 as against 105 per 1000 live birth at present.

is the availability of rural hospital beds per million population and infant mortality rate. The data given in Table 3 show that Punjab has the highest number of rural hospital beds as 233.5 per million rural population and lowest infant mortality rate after Kerala. The other states which have a higher intensity of rural hospital beds are Maharashtra, Assam, Tamil Nadu, Kerala, West Bengal, Himachal Pradesh and Gujarat. On the other hand, Uttar Pradesh has the lowest number of rural hospital beds as 21.8 per million rural population and highest infant mortality rate as 140 per thousand of live births. The other states having high infant mortality rate included Orissa, Madhya Pradesh, Rajasthan, Assam, Gujarat and Bihar. This shows that these states have relatively poor rural health infrastructure.

Index of Rural Infrastructure

The item and kind of activities of infrastructure put in place determine whether growth in the state/sector would be responding positively or not. Since emphasis on various items of infrastructure varied from state to state, the level of these activities also varied significantly amongst states. In order to examine the overall development, it was considered essential to build an index of rural infrastructure by combining different items. In all 14 sub-items of agricultural infrastructure were identified under nine major heads as detailed. Taking into consideration, the role and importance in influencing the level of agricultural production/productivity, each item/sub-item was assigned weight after discussion with agronomists crop scientists and other experts. The weights were assigned out of total value as hundred. The weighting diagramme for construction of index of agricultural infrastructure is shown in Table 4. Amongst the major items, highest weights were assigned to irrigation and marketing facilities for agricultural development. In the irrigation, more weight was assigned to the extent of irrigation and low weight to the source of irrigation. Under the marketing facilities, more weight was assigned to the net work of agricultural markets rather than storage facilities in the state.

Taking into consideration the available stock of infrastructural activities, the optimum/or desirable level as well as all India average, the statewise score were assigned to various activities. The following assumptions/criterion were adopted for assigning scores for different items Table A

All the states with a level of infrastructural activity equal to or higher than the above sppecification were given full score for that item and other states were accordingly scored in proportion to their level and the desired level of infrastructure activity except in rural infant mortality rate where higher value was assigned low score.

Statewise Score and Index

Scores of various items of infrastructure in different states, as per level of development indicated in Table 3 and the assumptions detailed in the previous section are shown in Table 5. Since these scores have been assigned to each item out of 100 and are additive in nature, the sum total of scores for all the items indicate the index of infrastructure of each state. It is seen from Table 5, that overall index of infrastructure is highest in Punjab followed by

Table 6 Statewise Index of Rural Infrastructure, Yield of Foodgrains and Value Productivity Per Hectare (1994-95)

State	Index of Infrastructure Per Hec (Kg)	Yield of Foodgrains Per Hec (Rs)	Value of Output
Andhra Pradesh	53.6(X)	1713(VII)	4089(XI)
Assam	50.8(XI)	1308(XI)	5402(XI)
Bihar	42.0(XV)	1446 (X)	4091(VIII)
Gujarat	55.6(VII)	1249(XII)	2062(X)
Haryana	65.9(IV)	2730(II)	7288(XVII)
Himachal Pradesh	56.6(VI)	1643(VIII)	6797(V)
Jammu and Kashmir	53.9(IX)	1632(IX)	6696(VI)
Karnataka	56.8(V)	1152(XIV)	3368(XII)
Kerala	70.0(II)	1873(VI)	8088(II)
Madhya Pradesh	42.0(XV)	1088(XIV)	2180(XV)
Maharashtra	54.4(VIII)	852(XVII)	2275(XIV)
Orissa	47.9(XIV)	1231(XIII)	2765(XIII)
Punjab	85.3(I)	3684(I)	9133(I)
Rajasthan	38.3(XVI)	906(XVI)	2109(XVI)
Tamil Nadu	68.4(III)	2358(III)	5204(IX)
Uttar mPradesh	50.1(XIII)	1932(V)	5714(VII)
West Bengal	50.4(XII)	2077(IV)	7798(III)

Table 5 Statewise Index of Infrastructure

All-India	4.2	5.0	3.5	1.8	3.1	2.7	6.1	4.2	3.2	2.4	2.4	2.7	3.8	7.6	52.7

Kerala, Tamil Nadu and Haryana, the index being 85.3, 70, 68.4 and 65.9 respectively against the all-India average of 52.1. The infrastructure index is lowest in Rajasthan as 38.3 and only slightly higher than this in the states of Bihar and Madhya Pradesh with index as 42. The overall infrastructure index is also relatively low in the states of Orissa, Uttar Pradesh, West Bengal and Assam. This index is moderately good in the states of Gujarat, Himachal Pradesh, Jammu and Kashmir, Karnataka and Maharashtra. The different states which have an overall low index of infrastructure, have varied defficiencies. Rajasthan has low level of development in irrigation, fertiliser sale depo, transport, agricultural marketing and rural wealth. Bihar has low index of infrastructural activities of rural transport, credit rural health, agricultural marketing and extension services. The Madhya Pradesh has poor infrastructure in terms of irrigation, transport, fertiliser sale depot, rural health, agricultural marketing and research support. Uttar Pradesh has inadequate facilities in terms of transport, credit, rural health, agricultural marketing and extension while West Bengal has poor infrastructure in terms of power, irrigation, agricultural marketing and extension besides poor research support.

Usually the two approaches, time series or cross section data are used to examine the relationship between the growth of agriculture and expanded level of infrastructure. In this study, as statewise infrastructural indices were constructed for one year, and cross section data of different states regarding infrastructure and agricultural production had been used to examine the relationship between the two parameters. The statewise index of infrastructure, per hectare yield of foodgrains and value of agricultural production for 1994-95 are shown in Table 6. It would be seen from Table 6 that the state of Punjab, which has highest index of infrastructure, also has the highest yield of foodgrains and value of agricultural production per hectare. Tamil Nadu and Haryana which have second and third highest index of infrastructure, have third and second highest yield per hectare of foodgrains. Rajasthan and Madhya Pradesh which have a very low index of infrastructure, have very low yield per hectare of foodgrains and total value agricultural production. In some of states like Himachal Pradesh which have a reasonably high index of infrastructure have a low yield rate of foodgrains but with a high value of agricultural output per hectare because of special features of cropping system. However, in certain state like Gujarat, Maharashtra and Karnataka despite a reasonably high overall Index of infrastructure, the yield of foodgrains and the total value of output per hectare are relatively low which is partly attributed to the special feature of millet based cropping pattern and partly to poor/weak physical infrastructure like irrigation, fertiliser, sale depot, agricultural marketing and extension services.

In order to examine the role of infrastructure on agricultural development, a functional relationship was established of the form $Y = a + bx$, where Y is the per hectare yield of foodgrains or value output from agriculture and X is the index of infrastructure. The estimated equations are as under:

(i) Foodgrain

$$Y = -887.676 + 47.005\,x\ ;\ R^2 = 0.6825$$
$$(8.277)$$

(ii) Value of output

$$Y = -1634.23 + 121.5434x;\ R^2 = 0.4210$$
$$(36.8011)$$

Note: Figures in brakets indicate standard error of the coeffcient)

The estimated functional relationship revealed that index of infrastructure is significantly influencing the per hectare yield of foodgrains and value of output from agriculture in the states. The coefficient of multiple determination (R^2) showed that about 68.25 and 42.10 per cent of the variability per hectare in yield of foodgrains and value of output from agriculture in different states is explained by the overall index of rural infrastructure. With every 1 point increase in index of rural infrastructure, average yield of foodgrains is likely to increase by about 47 kg. Thus if the states that have a very low index of infrastructure like Rajasthan, Bihar and Madhya Pradesh would improve the infrastructure index even by 10 points, they could increase their foodgrains production by about 470 kg per hectare. Similarly the value of output per hectare could be raised by about Rs 1,215 at 1990-91 prices with the same magnitude of improvement in infrastructure.

The study has established strong relationship between rural infrastructural development and level of per hectare yield of foodgrains as also of value of output from agriculture. There is significant scope for increasing the yield of foodgrains and agricultural income by improving the rural infrastructure. It has also identified states like Rajasthan, Bihar, Madhya Pradesh, Orissa, etc, which have poor infrastructure and low levels of yield of foodgrains and value of output per hectare. Items which required special attention for infrastructural development in different states have been indicated in the preceding section. The development of infrastructure in these states would require large-scale step up in investment in these sectors, which may be constrained because of financial resources. However, if economic growth is to be increased in the country, particularly in less developed states, then financial resources have to be raised for improving infrastructure either by prioritisation of allocation of government resources or raising investment from private/international sources. Though the priority allocation of financial resources in infrastrucutre may affect development of other sectors in the short run, returns from this in the long-term perspective would be enormous in terms of higher rate of economic growth.

Is Caste Appeal Casteism?

Oppressed Castes in Politics

Javeed Alam

Among the oppressed the appeal to caste is for unification of similar 'jatis' into larger collectivities and political mobilisation for power so as to subvert the very relations of the 'varna' order. Caste appeal here is, therefore, far from being casteism.

On the other hand, the self-perceived transcendence of the traditionally hegemonic middle class from caste consciousness has rapidly collapsed in the last decade. There has been a steady decomposition of the consciousness of the middle class into articulated caste interests of brahmins, thakurs and so on.

Within the Muslim communities there has been a shift away from concerns of security to those of equality and dignity – a politics in affinity to that of the dalits and the OBCs for recognition. They are therefore no more a vote bank; it is a case of alignment of interests of a secular nature, a social coalition of oppressed forces.

This fusion of opposite tendencies and intercession of contrary forces has rendered the process of democratisation more and more complicated so that simple judgments become one-sided and are a sure source of misunderstanding.

THE way we answer the question in the first part of the title is crucial in understanding the politics of the oppressed in India today, whether we take the dalits or the OBCs. Let me therefore straightaway say that it is not necessarily so that an appeal to caste for political mobilisation or for votes makes that stance casteism. Not necessarily needs emphasis because a peculiar reversal of relations within the order of 'varnas' is taking place in India today which has not been adequately analysed. It is due to this that casteism can manifest itself in the present situation even without an appeal to caste. It is also important to note in passing that this particular form of casteism has been a source of enormous strength to communalism of the militant Hindu right-wing or the hindutva forces; I will come to this issue again at a later point in the course of the argument. The rest of the paper tries to disentangle both the patterns and the causal chains implicit in the political process underway.

In an important way a seemingly unrelated issue is central in understanding the politics of the oppressed castes. Historiography has tried to come to grips with the question whether there was slavery in India in the way there was in Greece or Egypt or Rome. The debate was unfruitful as it could not throw much light on the issue. It therefore remains unresolved. I would rather like to ask what was the nature of bondage of the direct 'producer' in the Indian social formation in the pre-colonial times. This is important for the reason that what we today call the dalits or the OBCs were the producing classes in India either in agriculture or in secondary manufacture through household handicraft production or in guilds of the goods that were of general use for society or specifically for the ruling classes. All these sections of society were made up of dependent 'jatis' whether as peasants or agricultural labour or as artisans upon superior castes: dependence, in other words, were of the collectivities and not merely of the individuals. In other words the direct producers in India were unfree. But the nature of 'unfreedom' of the producers in India was of a 'collective' kind unlike the 'individual unfreedom of the European serf' or earlier on of the slaves.[1] Once the scriptural or juristic and structural condition of this bondage begins to crack, it therefore should follow that the battle for freedom too has to be of a collective nature unlike in the west where it had followed individually-oriented struggles for rights and entitlements even when these were collectively fought out. Democracy in India therefore has also become, in addition to the numerous definitions that set out its terrain, the sort of politics which the governed take recourse to;[2] to gain a voice, a foothold into something valuable, a sign of status, a measure of effective power and so on. Apart from the modern proletariat, the 'governed' in India have been largely made up of the dalits and OBCs; the category of the governed more or less overlapped with the direct producers. It needs to be emphasised that among the producers women played a very important role both in the household production and agriculture. Their work was very valuable in the maintenance of family welfare. Moreover, in the context of the level of development of the forces of production it was highly skilled and therefore comparable to those of the men in most respects. It is the connection between the nature of collective unfreedom and the politics of the governed, pronouncedly as it manifests in the post-Mandal phase, which gives us a clue to how 'castes' have acquired a decisively altered significance in the battle for democracy in Indian politics. And how within this whole framework the question of women's rights and entitlements gives rise to complicated battles where it is not an easy matter to adopt position or make judgments as we will see later.

The great merit of the concept of collective unfreedom is that it provides us with a historical basis as well as a heuristic tool to understand, what I would like to call, the great battle for bourgeois equality being fought out in the many terrains of Indian democracy whether we look at the electoral battle field, structures of power, institutions of parliamentary rule, bureaucratic set-up, educational arena and so on. India, to note in passing, is the only country in the world (from those of which data are available) where the composition of the electorate has changed in favour of the vulnerable section of the population between 1971 and 1996.[3] The proportion of those voting is tilting heavily in terms of their electoral participation. In 1996 as

against 1971 there are more of the poor, illiterates, dalits, OBCs, rural based people, Muslim sections[4] of the population, etc, among the voters. In 1971 there were more of the upper castes, well to do classes, literates, urban dwellers among the voters whereas in 1996 these same groups make up a much larger section of the non-voters.[5] In other words, the proportion of those voting out of the total electorate has remained the same, its inner composition has changed drastically.[6]

Here then we have a puzzle. All studies from different parts of the world have shown that the survival of democracy is negatively related to persistence of poverty, illiteracy, oppression and related features. And our India is incomparable very high on every one of these indices. These very sections have become the important supportive actors in the sustenance of democracy. Having pointed to the puzzle, I will not pursue the point further because it will take me into the trajectory of democracy in India which is not my purpose here.[7] What can be indicated in passing here is the direction in which to look to resolve the puzzle. More of these vulnerable people in 1996 think that their vote has an impact on the way things are run in the country and also want democracy to remain as a system of rule even if another system can solve their problems better.

Now all this has a bearing on what I have called collective unfreedom and the battle for democracy. Even a minimal move towards freedom in conditions of collective unfreedom as prevailed in India is also simultaneously a call for 'recognition'. A call for recognition is primarily for equality, to be accepted as one no different from the others. I have therefore called it a struggle for bourgeois equality, no pejorative sense is implied here in the use of the word bourgeois. One can as well call it juristic as against substantive equality, following the use of the 'juristic' Marx made in some of his early writings like, for instance, in *The Jewish Question*. Let us look at the very content of the politics of the oppressed for substantiation. There is hardly any worked-out economic agenda in their call for 'social justice' as is always the case with proletarian politics. This politics is not fighting for substantive equality, even Kanshi Ram does not ask for land reforms. He wants dalits to have power in the same way as the 'sawarnas' always exercised it over others This surely may not be a radical advance. But equally surely this represents a major shift in the terrain of democracy in India. All this has been a source of new kinds of commitments to the democratic processes in Indian politics and has given rise to a process of reconsolidation of democracy in India; marked though by two unwelcome features: instability of alliances and opportunistic shift of positions, both of which are an indication of the haste of the leadership of the oppressed groups to get into power. Let us look at this process a little closely to grasp what is not easily visible.

The battle for bourgeois equality in India is not being fought, as was the case in the west, between unequal individuals. It is being fought much rather between and by the vulnerable communities which were collectively unfree and found themselves in the realm of juristic freedom and competitive politics all of a sudden, around the time of independence. They also found their chances thwarted by the established middle class *privilegensia* composed of upper castes.[8] Two things were happening within these vulnerable communities. On the one hand because of capitalist development (especially in agriculture), land reforms, education, employment, etc, among OBCs for example and also reservations in education and employment among the dalits, class and income differentiation have been taking place and therefore a dispersal of earlier forms of concentration of power with their traditional leadership. Earlier, such castes organised as jatis were internally egalitarian because of same occupation and skill endowment and therefore similar income levels. With the break down of the close links between the ritual status and occupation and the movement of people into different occupations and acquisition of varied and dissimilar skills, jatis started becoming internally inegalitarian; the process though has a different tempo across the distinct caste leading to the formation of modern classes within the caste communities. Differentiation and dispersion of inherited bases of power, if we go by the global pattern of consequences of capitalist development, also sets in process the dissolution of the 'primordial' communities. Nothing of the sort has happened in India nor seems likely to in the near future even with the rapid individuation of interests and persons.

As a result of the capitalist development and the policy of reservations and some, though minimal, affirmative action by the state, within the class formation hinted at above a middle class as well has been in the process of formation and consolidation within these caste-based communities. A further result of this has been the impetus given in a contrary, or rather opposite, process of unification of these communities. It is in the interest of these newly emergent or *neo*, as against the established ones, middle classes to unify these communities as blocs to compete for power in democratic contestations especially the electoral competitiveness. These two contrary trends running simultaneously – diferentiation and undermining of the inherited forms of constitution of castes on the one hand and the process of internal unification on the other – represent two contradictory forces in society: one, the class formation within the communities and the individuation of interests around these and, two, the negation of the possibilities of the articulation of class tendencies as political positions. The Left therefore in today's conjuncture stands severely disadvantaged in terms of independent mobilisations. This, it seems to me, gives us a clue to the stagnation and decline of the Left in many regions of northern India where this process is now under way in a rather pronounced way. The process was going on but the battles waged by the OBCs and the unrestrained vandalism of the upper castes in the wake of the implementation of the Mandal award led simultaneously to two things.

(In parenthesis let us note in passing: Talking of the strategy and failure of development in India especially within the agrarian sphere a question in passing needs to be raised here. In a hypothetical situation of land going to the tillers as against what happened when it got passed on to the occupancy tenants belonging mostly to the intermediate and backward castes, what would have been the nature of the articulation of interests and the constitution of communities and contestations between and within them as well as the formation of classes within the castes, communities. The consolidation of the type that took

place and the consequent ascendance of caste-based communities like jats, yadavs, kurmis, marathas, etc, is inconceivable without the way land reforms got carried out. This question cannot be pursued here but it is important to raise it because it provides a link to another important point which comes up often as the relations of production within the agrarian economy and which has a close influence on the question of democracy in India – both its trajectory and inner dynamics. It is just for this reason that I want to add here that what has been said so far and what will be said henceforth about Indian democracy is based on this background understanding. There is nothing inexorable about the course of development of Indian democracy being analysed here. It has been conditioned, quite deeply, by the peculiarity of the bourgeois condition confronting Indian society. Any pre-existing social formation has many possible ways of developing in terms of the transformational strategies adopted and the nature of development of the popular movements.)

To move off from the parenthesis, first, it hastened the process of this unification under the *neo* middle classes within these communities. And together with these to a rapid decline, in fact refusal to accept at all among both the dalits and the OBCs, in notions of hierarchy, cast superiority, purity-pollution, etc. In this sense the yadavs or the kurmis or the dalits are now a caste in a nominal sense because all the normative markers of what constitutes the varna order are being rejected. Not just the normative injunctions which are under question but none of these castes any more accept the conditions of service or clientele of the 'jajmani' kind and much else which is so important for the validity of Dumont's argument. With all this has also collapsed the process of emulation for mobility in the ritual status as popularised in the term 'sanskritisation' by Srinivas. They have become a community in any sense of the term.[9] If we have a collectivity in a process of formation without the acceptance of any of the attributes which define the relations between jatis as set out in the varna ideology then the ascription of caste as its mode of social existence is difficult to sustain; more so in the realm of politics, democratic politics is in any case subversive of ordained hierarchies even if other things were to remain the same. The available varna terms stick as the varna vocabularies provide common idiom and an over-arching discursive framework not so much for internal references or self images of oppressed castes any more but much more so for mobilisation for power, to seek equality with those who consider themselves superior because they are pure. But it no longer can define the character of the collective as caste within the caste system as it earlier used to do. It is precisely here that one form of reversal of the varna order is clearly discernible. It is the upper castes of 'dwijas' who still refer to themselves with pride as brahmins or thakurs and what not and make all the efforts to enforce caste norms to sustain their social domination as a part of the class rule.

These are the communities made up of the oppressed castes which now are fighting for equality and recognition *vis-a-vis*, on the one hand, the dwija castes and, on the other, against the privileges of the established middle classes. The battle is fierce and 'ugly' and ugly because everyone among the oppressed is in a hurry and ready to jump the queue and break all the rules of the game so assiduously built up by us, the gentry. This is not to question the very worth of rules as such. But to recognise that to stick to rules assiduously is to wait rather longer in the queue and is therefore viewed as disadvantageous by the oppressed groups. We therefore must be cautious in judging by our sense of parliamentary decorum or social niceties as much of the media and drawing room conversation does. There is also the sense of hurry among the neo middle classes who lead the oppressed communities as they have no social status to inherit from their earlier life and no prior prerogative or enablement on which to build on as is the case with the established middle classes. This lack of background social asset of any kind is an important feature of the newly emergent middle classes from among the oppressed groups and therefore needs to be kept in mind for situating their political behaviour as well as opportunistic turns.

The process of extension of democracy in India has thus become a very untidy one and it does not seem to me likely that it will become any better in the short term. The understanding of this requires disentangling of the deeper processes of democratisation in Indian society which are masked by the surface features of untidiness. It is this untidiness which has been a source of so much adverse comment and condemnation by the media and other professional commentators which really has fed into, unintentionally much of the time, the propaganda machine of the hindutva brigade. The politics of the militant Hindu right-wing ever since Advani's 'rath yatra' has primarily been to arrest and roll back this process of democratisation of Indian society. This added dimension along with the earlier anti-minority bigotry and intolerance of radical dissent gives to hindutva politics a more complete fascist flavour.

Let me now terminate one side of my argument. Among the oppressed the appeal to caste is for unification of similar jatis into larger collectivities and political mobilisation for power so as to subvert the very relations of the varna order. Caste appeal here therefore is far from being casteism, as is often alleged. The allegation is based on an over-valuation of surface features and an utter disregard to the inner logic of the deeper processes in Indian politics. By the way, it is futile for us on the Left to expect a replay of the patterns of development in the wake of capitalist development in the west where communities or primordial bonds were slowly dissolved to be replaced by one supreme primordial bond, the nation. In the way that the capitalism in the third world is incapable of actualising bourgeois democratic aspiration, it is by a similar logic (of infirmity internal to it) not going to dissolve the pre-modern communities. They are going to be with us as potent political forces for a very long foreseeable future. Therefore tactical ways appropriate to the situation have to be worked out for radical advance.

What makes this battle further murky is the second process let loose by the post-Mandal struggles. There has been a steady decomposition of the consciousness of the established middle classes into articulated caste interests of brahmins or thakurs and so on. The traditionally hegemonic middle class always imaged itself as based on accomplishment, not untrue, but also believed that it has outgrown caste as the basis of its social being. The self-perceived transcendence from caste consciousness, as can now be seen as illusory, has rapidly collapsed in the last decade into a heap where they still want to be on the top of it. It has taken the form of separate spheres of varying upper caste consciousness, separate but all in close affinity one to the other. The brahmin and the baniya are therefore in a close embrace within the hindutva fold. It is the *privilegensia* striking back with reactionary sweep.

It is easy to understand this process if we remind ourselves that the established middle class was overwhelmingly drawn from its inception in the colonial times from the upper castes. It therefore inherited in the process of becoming property, prestige and power from its prior status. Its hegemony because of the head start in

economy, bureaucracy, and other institutions of public life did not make it feel the need to think in terms of caste but could consciously and by habit talk of itself as having transcended the caste barriers. It is this consciousness that has decomposed. Now as various upper castes, they seek to preserve their privilege by any means; but relying mainly on modern discursive jargon. Merit and efficiency are important in any modern society, that is why affirmative action is of such crucial importance for the socially disadvantaged. But if these same qualities are abstracted from larger considerations of social welfare and equity then this leads to deification and deification is a disguised mode of defence of vested interest; recall Marx's analysis of the fetishisation of commodities.

If the sawarnas still do not like to talk in terms of the caste nomenclature there is available the hindutva idiom and its platform where these middle classes can hide their newly discovered caste interest in seeking indentification with 'national interest'. We therefore can see the paradoxical spectacle of the most 'up-to-date personality' in India together with their caste brethren making a beeline into the folds of militant Hindu right-wing politics. It is therefore right to consider these as the most anti-democratic section of Indian society. The sudden shift of the upper castes from secular politics and the Congress Party, a representative of the secular tradition of the ruling class interest, is the manifestation of the decomposed consciousness presenting itself now as the broken bits of the old unity called the 'middle class' but refusing to recognise itself as having broken into its caste components seeking to secure the privilege, as reaction. Here is the second component of my poser right in the beginning. The argument of the hegemonic middle class about the efficiency of the brahmin or their cohorts among other sawarnas is casteism of an unalloyed kind. Hence the attraction of hindutva, a disguise to hide your holy nakedness. And hindutva has by now placed itself as a strategic presence to tame the upsurge among the oppressed communities by accommodating them in subtly worked-out modes of dependence; though this is not without its own contradictions.

That is why, to take a quick note of it, the Muslims too are in the thick of the battle for democracy; quite in the way the dalits and OBCs are. There is a split between the Muslim masses and the gentry which always provided it the leadership. The Muslim masses today find their traditional leaders from the gentry a hindrance to what they want to seek. As an aside, a Shafique Ahmed can surely become a governor but is in no position to even win a municipal election from a Muslim constituency. An ordinary Muslim would rather vote for a yadav or kurmi put up by Mulayam Singh or Laloo Yadav than to one from their own upper classes. Whether or not it represents a step towards being secular, definitionally, it is an important step in the direction of secularisation of politics. Ordinary Muslim masses find these communities of OBCs and dalits as placed adjacent to them and not in a relationship of dependence as it was in the case of their earlier relationship with the Congress. Adjacent is of considerable importance here. They are not one with them in any simple way. There has been a shift away within the Muslim communities from concerns of security fostered by the Congress to those of equality and dignity; a politics in affinity to that of the OBCs for recognition. They are no more therefore a vote bank; it is a case of alignment of interests of a secular nature, a social coalition of oppressed forces.

This contest and struggle is what has given a new rigour and strength to the liberal face of Indian democracy, even if it has failed to radicalise the transformative agenda and the vulnerable sections of the society are the co-pillars of this commitment for liberal democracy. This ought to be recognised and fore-grounded. Recognition of this fact is also important because in the unseemly behaviour of the political formations of the oppressed communities there has been a fear that this may be undermining parliamentary tradition which sustain the democratic polity. Whatever be the nature of wheeling and dealing between them and the indecorous political behaviour, the politics of the oppressed has also been responsible for the sustenance of traditions of civility between the communities and the secular character of the polity. This is an important gain in the face of ascendance of the politics of intolerance and hatred as practised by the hindutva. Indian state has not become fascist but the rule of the militant Hindu right-wing has given rise to all the fascist symptoms i the Indian society. Earlier in the wake of the campaign for the demolition of the Babri masjid and in the immediate aftermath of it, riots and pogrom were used to Hinduise national sentiment and consolidate these. Today there is a discernible change of tactics. In the highly visible and publicised persecution of Christians, and to a lesser degree of Muslims, the effort seems to be to make the everyday life of the minorities difficult. Undisturbed rhythms of everyday life are very important for a sense of peace and security. Small insults and indignities heaped often at so many points in the daily routine make life impossible to live. This exactly is what hindutva has now taken recourse to, pronouncedly with the Christians. This is an effective tactic to unnerve the ordinary people and yet get away with it. Indian society over the years of excessive and often gruesome violence has become insensitive to small acts of violence and invasions into the lives of others. Because there is no large-scale violence fascists can get away by saying that 'hardly, any one has been killed in Gujarat' and the loss of property is 'not even a few lakhs' and therefore what all we are hearing is an exaggeration of the English press. The shame of the matter is that the prime minister of the country endorses such a pernicious position. The tactic now seems to be to insensitise people to the importance of dignity in the ordinariness of everyday life.

In spite of all that is positive in the politics of the oppressed communities, there is a great infirmity in this battle for bourgeois equality. Each community wants to preserve its own internal relations of power and it is here they also take recourse to traditional ways of enforcing compliance. The worst result of all this is that the women are systematically excluded from the fight for equality. Women as restricted part of these communities are a segment of this process of egalitarian thrust *vis-a-vis* the women of the upper castes. But as persons within these communities remain, or are in fact becoming more, unequal in relation to men. In the beginning of this argument we noted that women in the pre-colonial economy performed valuable labour and in terms of skills their work was comparable to that of men. All this is changing in an adverse way for them. With the development of the forces of production they have suffered a downward mobility. As their work has remained static in relation to the development of skills in society its value has been going down; in other words it is becoming de-skilled in relation to the work done by men. This is perhaps more pronounced in the case of OBCs as compared to the dalits. Nevertheless, their work in all the oppressed communities has become marginal and their economic dependence on men has correspondingly increased.

What make matters worse for women are the moral codes which define life

within these communities. These moral codes militate against equality and gender dignity. They are always imposed and never advocated. It is here in terms of the criteria of advocacy as against that of imposition that we get a criterial basis to make judgments between modern moral outlooks and traditional moral codes. Any one of the modern moral outlooks seek compliance in terms of advocating a certain way of doing things which in turn involve, many a times, a great deal of persuasion. Quite to the contrary, traditional moral codes are more often imposed with threat of retaliation as the basis for compliance. It is therefore always in terms of the form and not necessarily in the content that the modern moral outlooks can claim a certain superiority.[10]

We must therefore be wary of defending difference unconditionally on the ground of the rights of the communities to a way of life, as many are doing against the homogenising tendencies of modernity. In the name of democracy we cannot also allow indignities and atrocities to go on because communities are so constituted or alternatively wait idefinitely for an alternative to emerge from within the community. Given their codes the dice is loaded against the vulnerable within, more against some like the women than the others.[11] While it is important to respect difference of culture and belief, this however must be on two conditions: that any practice which militates against the dignity of a person must be forced to defend itself and that the state must be forced to protect the person even if it means coercion.

So while we recognise the valuable nature of the shift in Indian politics which seemingly is based on castes but we also have to engage in a sustained democratic struggle against the inegalitarianism and hidebound outlooks inherent in the emergent communities in India; especially their gender blindness. In other words, while we welcome the extension of democracy in India, we simultaneously have to struggle to deepen democracy on this expanding canvas. Deepening of democracy apart from substantive content, requires two formal conditions in the Indian situation. Dalits and women have to bcome bearers of entrenched rights. Only then these communities can be made to embody a condition of rationality; that is, critical scrutiny and reflection as a pre-condition for claims on others.

In this process of democratisation that is becoming more and more complicated in the fusion of opposite tendencies and the intercession of contrary forces, simple judgments become one-sided and are a sure source of misunderstanding. The Left in particular has to be rather cautious because it is the only force which can give an anchor to this process and to the forces involved in it for a radicalisation of democracy as prelude to, when feasible, revolutionary advance.

Notes

[I would like to express my deep gratitude to D L Sheth for long hours of discussions which are still going on I am also thankful to Ambrose Pinto for giving his comments An earlier draft of this was presented at a seminar in the Department of Political Science, Punjab University, Chandigarh, where questions and comments were helpful in clarifying many issues]

1 Here I am building on a stray comment by Partha Chatterjee in *A Possible India*, OUP, New Delhi, 1998, ch 1.

2 I draw once again on Partha Chatterjee who has defined democracy in relation to India as "the politics of the governed", ibid.

3 CSDS Data Unit, based on a cross-polity survey conducted immediately after the 1996 parliamentary elections. The data for 1971 are also from a similar survey done then These two points in time are good references for comparison because the voting percentage had by then stabilised around 60 per cent Before that it had shown wide fluctuations

4 According to the CSDS data, if one were to take out 6 to 7 per cent of those who belong to the gentry or the middle classes among the Muslims, then the condition of the ordinary Muslims is no better than that of the dalits or the most backward castes

5 CSDS, op cit

6 Let us take two caste categories for illustration In 1996 against the average polling of 58 per cent, there are 1 per cent more OBCs voting as against 2 per cent less of the upper castes, that is 59 per cent OBCs vote as against 56 per cent of the upper castes It is more pronounced in case of the dalits On the same calculation as above, 60 per cent of the dalits vote as against 56 per cent of the upper castes Now if we convert the per cent figures into absolute numbers these will run into millions given the size of the electorate

Now this completely goes contrary to what western psephology has taught that education, status, well-being are all positively correlated to the act of voting This was quite so earlier in India but has changed completely in recent years. We cannot say when exactly this start happening but it is possible to infer, as w be evident in the argument in the text, th such a process has its beginning in the pos Mandal phase Nevertheless what remai clear is that this pattern has continued in eve election since whenever elections were hel since 1996 whether for parliament or the sta assemblies.

The inner consistency of the data can t checked by looking at the comparison betwe the illiterates vs the educated We get the sar results

7 I have worked on these questions in m forthcoming book *Democracy in India*

8 The closest analogy to this is the way t struggle of the ethnic communities went in America. The various migrant groups li the Irish, the Poles, the Italians and so sought to seek equality against the Whi Anglo Saxon Protestants (WASP) wh monopolised the positions of power and stat as the first migrants The process work relatively smoothly because of the continuo territorial expansion and unlimited econom growth The theory of melting pot worked i this specific context Today with the dryi up of both expansion and growth there is reassertion of diferent ethnic identities li those of the Hispanics, Blacks and other lat migrants. It is important to note that the were the very groups which did not gain o of the expansion and growth Today therefo there is a lot of woolly talk of multi-culturalis around in North America

9 Communities can be identified when the articulate in a socio-political context. A fixe definition can be a source of mis-specificatio Community boundaries vary as per the conte For example, in the face of the onslaught the hindutva forces Muslims or Christian may consider themselves and act a communities But in a situation, say of stri between the Shias and Sunnis, these the constitute themselves into communities i that context Such examples can be multipli in different ways, for example, a village get constituted into communities in a differe way during 'melas' then when it is in a feu with a neighbouring village.

10 For an illuminating discussion on this issu see Stephen Toulmin, *Reason in Ethic* Cambridge University Press, Cambridg 1961, esp pp 137 43.

11 For a sampling of the severity of law this ca work against women see Prem Chowdhr 'Enforcing Cultural Codes, Gender an Violence in North India', *Economic an Political Weekly*, May 10, 1997.

Kashmir: Sources of Conflict, Dimensions of Peace

Sumantra Bose

This article identifies and develops essential elements of a multi-dimensional approach to gradually, incrementally de-escalate the Kashmir conflict. It first pinpoints the essential features of that conflict, stressing that the problem has both exogenous sources in the form of the broader regional conflict between India and Pakistan, and endogenous sources, in the form of the existence of several fundamentally different political allegiances and preferences among the socially heterogeneous population of Kashmir. It also explains why neither plebiscite nor partition present viable means of resolving the Kashmir conundrum, using analogies and examples from Bosnia-Hercegovina and Quebec in the process. The article then develops one by one three interlocking dimensions of an alternative peace-building approach which takes account of the complex intersection of multiple, cumulating 'domestic' and 'international' factors that collectively define the contemporary Kashmir problem. This three-track approach is inspired by the ongoing strategy of building peace in northern Ireland and derives much of its substance from the central aspects of the Good Friday Agreement. The approach takes into account the legitimate concerns of Indian and Pakistani state elites with basic issues of territorial sovereignty, national interests and security, while accommodating the equally legitimate aspiration to self-rule of a large segment of the population of Kashmir.

Introduction

IN the wake of a relative 'thaw' in India-Pakistan relations following the Indian prime minister's shuttlebus diplomacy to Pakistan and the Pakistani prime minister's return visit to India, it has become ever more imperative for the south Asian region to seriously come to grips with the Kashmir problem, which is as old as the two countries themselves.

In this article, I try to do two things. First, I try to pinpoint – in a deliberately clinical vein – what the essential sources and features of the Kashmir conflict are today. I suggest, in the process, that the sources of conflict, while interrelated, are multiple and complex. Second, I try to develop the essential elements of an approach geared towards the gradual, incremental de-escalation of the Kashmir problem which takes into account its inherent complexities and multi-dimensionality. Note that mine is an attempt to identify the essential dimensions of a peace-building approach, and not to prescribe what a 'solution' to this problem might be: there is a fundamental difference between the two. My ideas in this regard have been inspired by the ongoing peace process in northern Ireland, especially certain central aspects of the Good Friday Agreement to build peace there signed in April 1998. There are several significant similarities in the configuration of the problems in northern Ireland and Kashmir, particularly in the complex intersections of a variety of 'domestic' and 'international' conflict-producing factors in both cases.

Sources of Conflict

In its contemporary incarnation, the Kashmir conflict has both exogenous and endogenous sources, which reinforce each other in a particularly intractable combination. Let me identify the exogenous sources first.

The major exogenous source is of course the broader regional setting – the very deep-seated mutual hostility between India and Pakistan which manifests itself above all over the focal point of Kashmir. It is incorrect in my view to regard Kashmir as the cause of the India-Pakistan conflict; that conflict has deeper roots and is much more than just Kashmir. However, it is correct to regard the real estate dispute over Kashmir as the single most important symptom of that deep-rooted animosity. Both countries have chosen to make possession of Kashmir central to the *raison d'etre* of their respective national existences – 'secular' nationalism in the case of India, Muslim nationalism in the case of Pakistan. The result of this competition are maximalist, zero-sum claims to Kashmir which are fundamentally irreconciliable with each other. In their present form, they leave absolutely no scope for any kind of compromise through dialogue and negotiation.

There are also, however, formidable sources of conflict which are endogenous to Kashmir itself. Jammu and Kashmir – both the two-thirds of the pre-1947 princely state which is under Indian control as well as the territory as a whole, encompassing the remaining one-third which is under Pakistani control – is no unitary phenomenon. In fact, it is just the opposite. Not only is it composed of several distinct geographical regions (Kashmir Valley, Jammu and Ladakh in India, the Azad Kashmir districts plus Gilgit and Baltistan in Pakistan), but its population is divided into a bewildering multiplicity of religious, ethnic, linguistic and caste groups. This means that not only are there Muslim, Hindu, Sikh and Buddhist elements in the population, but that the two major elements – Muslim and Hindu – are further divided internally along faultlines of region, ethnicity, language, caste and political affiliation. Thus for example, the typical first preference of a Kashmiri Muslim from the Valley – the historical centre of Kashmiri autonomism once personified by Sheikh Mohammad Abdullah, the 'Lion of Kashmir' – is an independent Jammu and Kashmir. But that of his gujjar co-religionist in Jammu is usually to stay within India (though not necessarily on any terms).

Along with this social fact of inherent diversity and the existence of multiplicity of complicated, cross-cutting linkages and cleavages, there are several distinct political identities and orientations in Kashmir. I am talking here not of partisan political preferences of a narrow sort, but of basic political allegiances – which national identity is preferred by people as individuals and as members of different communities in Kashmir, and which state they identify with and wish to belong to. In Indian-controlled Kashmir, there are three distinct political orientations in this fundamental sense – pro-independence (the preference of a decisive majority in the Valley and of a sizeable minority in the Jammu region), pro-India (the preference of a majority in Jammu as well as in Ladakh and of a small minority in the Valley), and pro-Pakistan (the preference of a relatively small minority in the Valley and an even smaller one in Jammu). While I am in a less authoritative position to comment on the corresponding situation in Pakistani-controlled areas (not having had the opportunity to do field research there), I believe two major and fundamentally different political orientations exist there as well – loyalty to Pakistan and support for the 'third option' of independence.

The major endogenous source of conflict in Kashmir is that these different political orientations are fundamentally irreconcilable with each other. While most types of political disagreements are amenable to some sort of resolution through negotiation and bargaining, there is one specific type of disagreement which is usually not – differing conceptions of what one's national identity is and with which state one's basic political allegiance lies. In societies that are divided along this crucial, highly intractable faultline, attempts to forcibly impose the preferences of one group on the others in the population, or to resolve the issue through popular referenda (plebiscite) decided on the majoritarian principle (fifty per cent plus one) are not only untenable. They are positively dangerous, recipes more for civil war than anything else.

Recent experiences in Bosnia-Hercegovina (BiH) and Quebec, as well as northern Ireland, powerfully corroborate my argument. In a 1992 independence referendum in BiH, 63 per cent of the eligible electorate turned out (almost all of whom were Bosniaks or Muslim Bosnians and Croats) and 98 per cent of these voters supported Bosnian independence, which followed, along with international recognition, in short order. However, the referendum was massively boycotted by the Bosnian Serb community (about 35 per cent of the population), who disagreed with its very rationale. The descent into civil war in Bosnia became inevitable the day the results of this referendum became known. That turned out to be not a two-cornered but a three-cornered civil war, since unlike the Bosniaks, most Croats who participated in the referendum and voted yes had done so not out of any sense of allegiance to an independent state of BiH, but because they hoped that BiH's separation from the Serbia-dominated rump of Yugoslavia (Slovenia and Croatia had already seceded from Yugoslavia by that time) would be but a stepping-stone to the annexation of large Croat-dominated areas of BiH by the newly independent Croatian state. Three and a half years after the formal end of that civil war, Bosnia-Hercegovina still lies effectively partitioned into Bosnian Serb, Bosnian Croat and Bosnian Muslim statelets, and each of those three zones of control has an overwhelmingly nationally homogeneous population engineered through mass murder and even more massive expulsions and forced deportations, eerily reminiscent of the partition of India in 1947 (Bosnia was a patchwork mosaic of the three groups till the war).

A 1996 independence referendum in Quebec was defeated by the narrowest of margins – 50.4 per cent of those voting said *Non* to independence while 49.6 per cent said *Oui*. The referendum completely polarised the electorate, with the pro-independence majority of the Francophone population (who make up about 80 per cent of Quebec's total population) pitted in a bitter confrontation with the very large anti-independence minority among the Francophones themselves, allied with the overwhelmingly anti-independence minorities in the population (Anglophone Quebecers and the native Indian peoples). Civil war did not result in Quebec, but Kashmir and south Asia are relatively speaking much more similar to Bosnia and the former Yugoslavia than to Quebec and Canada. In any case, even if the outcome of the Quebec plebiscite has been exactly the reverse – 50.4 per cent for independence, 49.6 per cent against – the problem would still not have been resolved. Indeed, an even more volatile situation would have been created with one-half of the citizenry triumphantly celebrating the dawn of 'freedom' and the other half feeling totally insecure and furious about being forced into a new state against their will.

These examples dramatically expose the great limitations and dangers of using plebiscitary-majoritarian mechanisms to decide highly sensitive issues of 'self-determination'. In the case of northern Ireland, of course, the Good Friday Agreement promises that northern Ireland will not be detached from the United Kingdom and be made part of an unified Ireland unless and until a simple majority of the electorate of northern Ireland ratify such a change through a popular referendum. There is more to this clause than immediately meets the eye, however. The architects of the Good Friday Agreement are perfectly aware that such a situation will not transpire in the next 20 to 30 years at least, since the (pro-unification) nationalist Catholic population, which has been growing faster than the (pro-British) unionist Protestant population, will nonetheless not become a majority of the adult voting population for at least another generation. (Catholics are currently 41 per cent of population of northern Ireland, up from 33 per cent in 1920, while Protestants constitute the remainder. However, 52 per cent of all four to nine-year-olds in northern Ireland are Catholic; this is the so-called demographic 'time-bomb' of Ulster politics.)

In other words, the plebiscitary-majoritarian provision on northern Ireland's future contained in the Good Friday Agreement has been put there by its architects secure in the knowledge that there is no prospect of its implementation for at least another 20 years. If not, I doubt it would be there in the first place; and when in a couple of decades the time does come to determine northern Ireland's final constitutional status, I doubt it will be determined *simply* through a plebiscite decided on the 50 per cent plus one formula. Even assuming, as the architects of the Good Friday Agreement obviously hope, that a significant improvement, based on political power-sharing, does occur in relation between Ulster's two communities in the interim, use of that mechanism and nothing else would probably still be rife with enormously inflammatory possibilities down the road. In Kashmir as in Bosnia, recourse to the plebiscitary-majoritarian method is simply a non-option. It has inherent risks and problems, aside from the facts that India will never allow such an exercise and Pakistan will not agree to it either unless the 'third option' is excluded (in which circumstance a plebiscite loses all meaning for the large pro-independence sector of the population in both Indian and Pakistani-controlled areas).

Combine exogenous and endogenous factors, and the Kashmir conflict looks almost impossibly intractable. To the citizen of Jammu and Kashmir whose fundamental allegiance lies with India, the only legitimate unit of governance is India – including Kashmir. To the citizen whose basic identity is with Pakistan, the only legitimate unit of governance is Pakistan – including Kashmir. To the citizen fundamentally committed to the achievement of an independent Kashmir, the only legitimate unit of governance is an as yet phantom state of Jammu and Kashmir full independent of both India and Pakistan. This configuration of the problem is similar to that in Bosnia: with the Serbs committed to retaining Bosnia as part of an united Yugoslavia or failing that, incorporating as much of it as possible into a Greater Serbia; the Croats looking to merge as much of Bosnia as possible, especially those areas with majority Croat populations, into an emerging Greater Croatia; and the Bosnian Muslims stranded between the devil and the deep sea, their leadership stating a declaratory commitment to an united multinational Bosnia but quite unable to persuade Serb and Croat citizens about the legitimacy of such an entity.

There is obviously no space whatsoever for finding any resolution to the Kashmir conundrum within the present framework of three zero-sum, competing and mutually incompatible nationalist claims to its territory and population. The framework itself needs to be radically modified if there is to be any prospect of progress towards building a viable peace in Kashmir. This is especially so because each of the three maximalist positions of Kashmir suffers from crippling deficiencies.

The Indian commitment to retaining Kashmir as an 'integral part' of the Indian union on its own terms can only be realised, as the history of the last 50 years demon-

strates, by suspending the basic civil rights of the citizens of Kashmir, largely disallowing their democratic right to popular representation, accountable government and federal autonomy, and – when all else fails – setting up a regime of military occupation across large areas of Indian-controlled Kashmir and unleashing a campaign of sustained repression against its population. A high and rather embarrassing price to pay for keeping Kashmir as the jewel in the crown of secular, democratic India; but not too high, most of the Indian establishment still thinks.

The maximalist Pakistani claim to Kashmir is seemingly utterly blind to the reality not only that a significant proportion of the population in Pakistani-controlled Kashmir may in fact prefer independence as a first choice, but more importantly, that only a small minority of the population in Indian-controlled Kashmir wants to join Pakistan. Even in the part of Indian-controlled Kashmir most disaffected with the authoritarian militarism of Indian rule – the predominantly Kashmiri-speaking and Muslim Valley of Kashmir and a few contiguous areas of the Jammu region – the overwhelming popular preference is for independence. The attitude of these independence supporters towards Pakistan varies – from lukewarm at best to venomously hostile at worst.

The standard independentist line has problem of its own. It lays claim to the entire territory of pre-1947 Jammu and Kashmir – encompassing both Indian and Pakistani-controlled portions - for its putative independent state. But the ideologues of independence are seemingly oblivious to the reality that the population of that territory contains very large numbers of people – almost all Hindus, Buddhists, and Sikhs who live in Indian-controlled Kashmir as well as a sizeable proportion of Muslims living there – whose fundamental, non-negotiable allegiance is to India (these are mostly ethnically and linguistically non-Kashmiri Muslims of the rajput, gujjar, pahadi and shiite communities, who comprise most of the Muslim population in Jammu and in Ladakh, though there is a small minority of India backers among Kashmiri Muslims as well). Moreover, a large proportion of the population of Azad Kashmir and the northern areas, which constitute Pakistani-controlled Kashmir, are probably quite happy being part of Pakistan and have no interest in the independence idea. These pro-India and pro-Pakistan populations are extremely unlikely to voluntarily consent to becoming citizens of a new, independent state of Jammu and Kashmir. Moreover, the method proposed by most independence advocates to settle the question of 'self-determination' - the plebiscite decided by simple majority – is utterly insensitive to the regional and other forms of social and political diversity in Kashmir. Its use would be akin to bludgeoning with a blunt instrument a patient in dire need of tools of surgical precision.

The three contending maximalist claims to Kashmir are mirror images of one another in one important sense. All advance a rhetorical claim to the entire territory of Jammu and Kashmir as it existed prior to 1947 – though India actually has long wanted the line of control separating Indian and Pakistani-controlled Kashmir to be made into the permanent international boundary, which Pakistan as well as most pro-independence Kashmiris do not want to accept. But none of the three is able to command the loyalty of more than a segment of the population of that territory. The promoters of the independence option most probably have the support of the single largest segment – but no more – followed by India and Pakistan supporters, in that order. In short, the contemporary Kashmir problem is a cul-de-sac of monumental complexity.

Partitionist options have no potential to resolve this tangled situation. Quite apart from the distasteful, indeed horrific images stirred up by any mention of partition in a subcontinental context, and the fact that no serious political force anywhere in Jammu and Kashmir advocates such options openly (in fact, most are resolutely opposed to any such formula, especially the independentists), partitionist ideas have almost insurmountable practical problems. Since partitionist options are usually advocated precisely on grounds of 'practically' alone – for they are almost invariably ethically obnoxious – this is, no doubt, a very serious problem.

For example, if the Kashmir Valley, the locus of the Kashmiri independence movement from the 1930s till the present, were to be hived off from the rest of Indian controlled Kashmir to form an independent state (something India will never allow anyway), the population of the new state would include a minority of Hindu and Muslim citizens whose basic loyalty is to India, as well as another minority of Muslim citizens whose basic loyalty is to Pakistan. Most of these people would probably prefer to migrate permanently from their homeland rather than put up with such an eventuality, and some would work very hard to subvert the new state from within – or from exile, for that matter. The fact that these people would be a numerical minority in the new state does not at all mean that the question of their rights is politically insignificant. The prospects of minimum viability and survival of an independent Kashmir Valley in such circumstances is obviously suspect.

Moreover, a large number of independentalists would be left outside the borders of such a state, for example in the mountainous district of Doda in the Jammu region, contiguous to the southern parts of the Valley. Fifty-seven per cent of Doda's population consists of Kashmiri Muslims who by and large support independence. However, the other 43 per cent are Hindus who not only love India but usually support the Hindu nationalist Bharatiya Janata Party (BJP). In the congested towns of Doda district, one neighbourhood defiantly flies the green flag of Islam and sometimes, the PLO-style tricolour associated with the independentist creed of the Jammu and Kashmir Liberation Front (JKLF); the walls are splattered with graffiti hailing the martyrdom of those who have given their lives for *azaadi* (freedom). Right across the main street, the other *mohalla* (quarter) rejoices in a sea of saffron flags, the colour of militant Hinduism, and the other tricolour, that of the Indian Republic; the slogans on the walls proclaim eternal allegiance to one India, united and indivisible.

Though an extreme case even by Kashmir standards, I cite the example of Doda precisely because it graphically illuminates both the complexities of the contemporary Kashmir problem as well as the futility of partitionist prescriptions in dealing with that problem. Maximalist, zero-sum rhetorics – the common attribute of the approaches of the two national governments as well as that of the aspirant third national government, the Kashmir independence movement – can pretend these complexities do not exist. In the process, all they achieve is a dialogue of the deaf – if that – and a freezing of the past and present stalemate in perpetuity. But in real life and on the ground in Kashmir, these complexities continue to exist, and suggest that an alternative approach to building peace in Kashmir is strongly called for.

Dimensions of Peace

In the rest of this article, I identify and briefly discuss the three essential dimensions of such an alternative approach, derived from the ongoing experience of untangling a similarly bitter and historically rooted conflict – involving, like Kashmir, closely related, cumulating 'internal' and 'international' aspects – in northern Ireland. Note once again that what I outline here is an approach to making peace – that too through a very gradual, incremental strategy – not a substantive solution. Even in the most optimistic circumstances, Kashmir, like Ulster, will persist as an exceptionally thorny problem for a long time to come. The question is really whether the various parties to the conflict can, as

in Ulster, be prevailed upon to continue their dispute by more civilised means in the future than has been the case in the past and present. As one wit has rationalised the blockages that keep arising in the northern Ireland peace process, shouting, however unpleasant, is still preferable any day to shooting.

The three dimensions of my proposed alternative approach to Kashmir are, like the roughly analogous three 'strands' of the peace process in northern Ireland, interlocking and mutually dependent. They represent three parallel tracks of an integrated approach designed to more or less simultaneously address the interlocking constellation of domestic and international factors that together define the Kashmir problem. Let me preface my sketch of that three-dimensional approach by saying that the current situation in Kashmir is in one important way very similar and in one important way very dissimilar to the corresponding political climate in northern Ireland.

First, the similarity. As in Ulster, there is a deep and widespread weariness with violence in the strife-torn areas of Kashmir, and a deep public yearning for the gun to be taken out of politics. But as the example of northern Ireland demonstrates, before the gun can be taken out of politics, those wielding the gun or supporting its use as a political weapon have to be recognised and validated as bona fide participants in legitimate, institutionalised politics – to the greatest degree possible. Demonisation of entire sectors of political opinion as practitioners or apologists of 'terrorism' and 'fundamentalism' – and their exclusion from political and diplomatic processes on the basis of such characterisations – will guarantee a continuation of violent, polarised conflict.

Now for the big dissimilarity. Setting aside a history of centuries of hostility and distrust between their nations, the governments of Great Britain and the Republic of Ireland have for the first time in the 1990s demonstrated the determination and the capacity to jointly tackle the problem of northern Ireland, the overriding priority of the joint effort being not the realisation of anachronistic national egos and agendas but the establishment of a framework that will enable a durable peace and co-existence in Ulster. This is a new development – till the 1980s, the British and Irish governments were more or less content to lend their support, albeit in qualified and modulated ways, to the more 'moderate' articulations of the zero-sum (pro-British) unionist and (pro-Irish) nationalist positions within northern Ireland.

The British and Irish governments have also realised that for the joint effort being directed from London and Dublin to have any chances of success, it must come to grips with the internal complexities of Ulster politics and accommodate the participation in the peace process of as wide a spectrum of the divided and disputed province's political opinion as possible. This includes both 'moderate' (Social Democratic Labour Party – SDLP) and 'extremist' expressions (Sinn Fein – SF, the political wing of the Irish Republican Army or IRA) of nationalist opinion, as well as the corresponding moderate and to the extent possible extremist expressions of unionism (the Ulster Unionist Party or UUP representing the first category and the Democratic Unionist Party or DUP as well as smaller but politically crucial front parties of Protestant paramilitary groups opposing the IRA the second). The authorities in London and Dublin know that the Anglo-Irish Agreement of 1985 – an earlier move towards a rapprochement on northern Ireland – eventually failed to deliver on its promise precisely because it was concluded on a bilateral basis between the two governments, and failed to take into account the internal complexities of Ulster politics or to obtain the support of its most important actors. In total contrast to the Good Friday Agreement, which was developed through all-party talks organised and supervised by the British and Irish governments, the Anglo-Irish agreement was supported solely by the moderate nationalist SDLP. It was unequivocally opposed by Sinn Fein as well as by the entire range of unionist political opinion.

Such is obviously not the situation prevailing in the subcontinent. The Indian and Pakistani governments have, as yet, demonstrated no serious willingness or capacity to set anachronistic national egos and agendas aside. The deeply troubled, indeed precarious domestic political circumstances of both countries (especially acute in Pakistan) do not permit much optimism that they will. Nor have the two governments shown much willingness, as yet, to acknowledge the complexities of Kashmir's internal politics and to recognise the major representatives of the different political tendencies within Kashmir as important actors in their own right, rather than as puppets to be manipulated or 'enemies' to be demonised. However, for any future peace process in Kashmir to have any viability at all, there has to be some prior progress on both these counts.

Dimension I: The Delhi-Islamabad Axis

Dimension I of the alternative strategic approach to Kashmir has its rough equivalent in Strand III of the northern Ireland peace process, which is intended to foster the "harmonious and mutually beneficial development of the totality of relationships" between the governments and populations of the British and Irish Isles. It finds institutional expression in a 'British-Irish Council' and a 'British-Irish Intergovernmental Conference'. These bodies are intended to promote overall co-operation on a full range of matters between the two countries – and constituent units thereof – as well as provide guidance and direction to the peace process within northern Ireland. They have representation from high levels of the two national governments (they are jointly chaired by the prime ministers of Britain and the Irish Republic), from parliamentarians on both sides, and from among executive members (ministers) of devolved autonomous regional governments not just in northern Ireland but also Scotland and Wales.

Strand III is generally regarded as the least difficult and problematic dimension of the northern Ireland peace process (hence it is Strand III), given the demonstrated common commitment of the British and Irish governments to find a durable democratic solution to the conflict in northern Ireland and to co-operate on all other outstanding issues as well. In the case of south Asia and Kashmir, however, the dimension of overarching inter-governmental co-operation clearly needs to be developed on a priority basis – given the retarded and conflictual nature of the India-Pakistan relationship – if the other two dimensions, which are specific to Kashmir, as well as any peace-building process as a whole, are to stand any chance of success. For this reason, the urgent task of building a viable Delhi-Islamabad axis is Dimension I here.

In practical terms, this could mean the establishment of a permanent India-Pakistan intergovernmental conference to promote the harmonious and mutually beneficial development of the totality of relationships between the two countries. This body should be chaired by the respective prime ministers, and its twice-yearly plenary meetings could be rotated between Indian cities like Delhi and Calcutta and Pakistani cities like Islamabad and Lahore. Other representatives to this body would include ministers, bureaucrats and parliamentarians from both sides, who can meet separately with their counterparts to consider ways of developing co-operation in their specific areas of policy responsibility.

This intergovernmental conference should have a standing committee on Kashmir. Whether or not Kashmir is 'the core issue' of India-Pakistan relations (as the Pakistanis say) or just one among a number of outstanding issues (as the Indians claim), it is certainly important enough to be treated as a priority issue on the agenda of regional co-operation. This standing committee should be chaired by

the respective prime ministers and should include the foreign, defence and interior ministers as well as the defence chiefs of both countries as permanent members. It should also include the senior professional civilian officials of the foreign, defence and interior ministries and of the respective prime minister's offices (PMOs), senior parliamentarians belonging to different parties from both countries, as well as prominent citizens in India and Pakistan who have shown a commitment to improving relations between their countries. At a later date, executive members of freely elected autonomous regional governments in both the Indian and Pakistani sectors of Kashmir (see Dimensions II and III below) should also be included as representatives on the Kashmir committee of the intergovernmental conference.

Dimension I, if realised, would send an unequivocal signal that the governments and high policy-making circles of both countries are committed to addressing all their differences, including especially the Kashmir dispute, through co-operation rather than conflict. This, to reiterate, is an essential pre-requisite for progress on the other two, Kashmir-specific dimensions as well as for the minimum viability of the approach as a whole.

Dimension II: The Delhi-Srinagar and Islamabad-Muzaffarabad Axes

Dimension II is roughly equivalent to Strand I – which is the single most crucial strand – of the northern Ireland peace process, and has similar objectives. The key objective is what might be called the gradual, incremental normalisation of politics within Kashmir (in both Indian and Pakistani-controlled zones), and the devising and implementation of political frameworks which can foster a working degree of internal accommodation and co-operation within Kashmir between representatives of communities holding radically different basic political allegiances. Since in my conception the zones of Kashmir under de facto Indian sovereignty and de facto Pakistani sovereignty should be treated as separate entities for the purposes of Dimension II, I call this twin-track the Delhi-Srinagar and Islamabad-Muzaffarabad axes.

On the Pakistani side of the line of control in Kashmir, Dimension II should be relatively easy to implement. Two basic things need to be done here. First, an end to the systematic harassment and intimidation by Pakistani authorities and agencies of groups active in Pakistani-controlled Kashmir who espouse pro-independence politics (such as the JKLF and Jammu and Kashmir People's National Party or JKPNP), and the levelling of the playing field in competitive elections between these groups and those holding pro-Pakistan views, including the local units of all-Pakistan parties. For example, at present, the pro-independence formations, who have significant public support, are not permitted to contest elections to Azad Kashmir institutions unless they first pledge an oath of allegiance to Pakistan and to the maximalist Pakistani claim on Kashmir. Since the pro-independence forces are usually reluctant to do this – it compromises the basis of their political identity – they end up being excluded, along with their mass constituency, from participation in the arena of legal, institutionalised politics in Azad Kashmir, which is consequently monopolised by Pakistani and local pro-Pakistan groups. This exclusion means that one of the two basic strands of political opinion present in Pakistan-controlled Kashmir has virtually no recognition or representation in its institutional political life. This needs to be rectified if politics there is to be normalised.

Second, the autonomous status of Azad Kashmir and its institutions needs to be made genuine and fully functional, protected from constant interference and manipulation from within and without by Pakistani agencies and authorities.

The implementation of the Delhi-Srinagar track of Dimension II would present a very formidable challenge. This is primarily due to two factors: First, the very great internal social and political diversity of Indian-controlled Kashmir, in particular the existence of population groups holding three radically different basic political allegiances; and second, the immense difficulties for normalisation resulting from a decade of guerrilla warfare and counter-insurgency on its territory. I will restrict myself here to outlining the most fundamental and important aspects of that challenge and how they might be addressed most efficaciously.

The Indian government appears to be interested currently in implementing some limited, reciprocal 'confidence-building measures' *vis-a-vis* Pakistan. I would suggest, however, that it is even more urgent for the Indian government to devise and implement measures that might enable it to regain at least a modicum of the confidence of the inhabitants of Indian-controlled Kashmir, especially the citizens of those areas who have suffered the most from the violent conflict of the past decade and the repression of the vast Indian state-security apparatus based there. This requires two things: first, a fundamental revision and reorientation of the basic principles of India's long-term pacification strategy in Kashmir, second, the implementation in the short to medium term of a slew of confidence-building measures to gradually normalise the disturbed situation on the ground.

The implementation of both these points has in turn a prior prerequisite – the coming into being of something resembling a more or less stable ceasefire in the disturbed areas of Kashmir. That among other reasons is why some progress on Dimension I is so very important to the prospects of this, the most difficult track of Dimension II. For all its police and military resources invested in Kashmir, the Indian government has found it impossible to fully overcome the guerrilla resistance – which is almost entirely trained, armed and otherwise supported by Pakistani agencies and/or from Pakistani-controlled territory – and will find it impossible to fully 'pacify' Kashmir unless a new, overarching co-operative framework on Kashmir between India and Pakistan is put in place. Even then, a cessation of fighting may not prove easy to achieve given the doubtful degree of control of any Pakistani agency over some of the wilder guerrilla groups that have become active in Kashmir over the last few years, not to forget the likely opposition of hardline elements within the Pakistani military, intelligence and state-security apparata to a different, co-operation-based approach to the Kashmir problem.

The fundamental revision and reorientation in india's longer-term Kashmir strategy which is called for is this. To date, Indian governments have pursued a policy of limiting participation in the institutional political life of Indian-controlled Kashmir to only those political elements which are committed to its own goal of retaining Kashmir within the Indian union on terms dictated unilaterally by New Delhi. What has resulted from this policy is a series of lame-duck local governments run by India's client politicians who have, at best, a very limited base of popular support. India will never be able to normalise Kashmir or stabilise and legitimise its supposedly 'elected' surrogate governments there while Indian policy effectively excludes from any recognition and participation in Kashmir's public life representatives of two of the three basic strands of political opinion present in Indian-controlled Kashmir. This applies especially to the pro-independence elements whose ideology enjoys massive popular resonance in the most disturbed areas of Indian-controlled Kashmir.

India has been prepared to accommodate some of these elements in the political processes it has unilaterally sponsored in Kashmir, but only on condition that the independentists renounce their political beliefs and platform and accept that the Kashmir problem is purely an internal affair of the Indian state. This amounts to demanding abject, virtually unconditional capitulation. It is not surprising that pro-independence politicians and groups have

not been able to accept these terms, and have consequently been relegated to the rather unfruitful role of ceaselessly repeating their own variant of maximalist, all-or-nothing rhetoric while languishing on the margins of Kashmir's politics. However, I believe that most of them would be willing and able to participate in developing a Delhi-Srinagar *modus vivendi* which is but one dimension of a broader approach to Kashmir, an approach which acknowledges the multiple, interlocking domestic and international aspects of the problem and has Pakistan's seal of approval.

Sinn Fein's political leadership, represented above all by former top IRA commanders Gerry Adams and Martin McGuinness, have not abandoned their ultimate political commitment to an united Ireland. However, realistically recognising the existence of a whole slew of formidable internal and international constraints to the achievement of that objective, and the limitations of a strategy that emphasises unending armed struggle and is top heavy on rhetoric, they have chosen to be part of and work through a peace process which precludes any possibility of a full-fledged reunification of Ireland for at least another 20 years (and perhaps not even then). But they could never have been expected to participate in that process if an entry ticket had been conditional on their renouncing their core political beliefs and the ultimate goal of their struggle. The biggest lesson for Dimension II's Delhi-Srinagar track of Strand I of the northern Ireland peace process – which focuses on creating power-sharing institutions in Ulster based on parity representation of the nationalist and unionist communities and participation in running of those institutions by all major political parties on both sides of the communal divide – is that talks to reconstitute the governmental structures of Indian-controlled Kashmir must be as consensually oriented and inclusive as possible. This means that representatives of all three strands of political opinion in Indian-controlled Kashmir must be involved in that process. The political groups representing the smallest of the three segments, the pro-Pakistan stream, might in a curious way be the least troublesome since they are in the habit of falling in line with whatever Pakistan wants them to do and are also conscious of their limited popular base within Indian-controlled Kashmir. Indeed, there is a powerful faction even within the most pro-Pakistan group in India-controlled Kashmir – the Jama'at-I-Islami and its affiliated armed organisation, the Hizb-ul-Mujahedin – which genuinely wants an end to the present stalemate and would welcome a new approach to the Kashmir problem.

That process would logically lead eventually to a reinstitutionalisation of a multi-tiered political structure autonomous of New Delhi's authority in Indian-controlled Kashmir. But this will prove possible to achieve and viable to operate only if three core conditions are met: (1) Representatives of the independence option are on board; (2) The new arrangements win the assent of the second largest segment of popular opinion, the pro-India political elements and the social groups they represent; and (3) If the significant differences in social composition and political aspiration between Indian-controlled Kashmir's two major regions – Jammu, which has a pro-India majority, and the largely pro-independence Valley – are fully factored into the settlement.

Such a longer-term rapprochement on substantive issues will, however, only be possible if facilitating conditions are created in the short to medium-term on the ground in the violence-ridden areas, through the implementation of measures promoting gradual normalisation of the day-to-day life of a traumatised society. In this, the Indian government would have to bear a large share of the initiative. Its responsibilities, once again similar to confidence-building measures currently under implementation in northern Ireland, can be grouped under three interrelated categories: human rights, policing arrangements, and political prisoners.

Human rights: Following a more or less stable ceasefire, the Indian security presence in Kashmir would need to become as unoffensive and unintrusive towards the civilian population as possible. This means that 'crackdowns' (cordon-and-search operations) and checkpoints should be kept to a bare minimum, and progressively be done away with altogether. The emergency powers of Indian security forces operating in Kashmir should also be scaled down and gradually eliminated. Continuing violations of human rights - ranging from minor infractions like verbal abuse and beatings to acts such as rape, torture, summary executions and custodial killings – must be strictly controlled and the perpetrators given speedy, exemplary and well-publicised punishment. A special human rights commission for Indian-controlled Kashmir, with representation from Indian, local Kashmiri and international human rights activist groups, should be set up to monitor the behaviour of the security forces and investigate unresolved past incidents of abuse such as the fate of 'disappeared' persons. A frank acknowledgement by the government of India that large-scale atrocities against civilians have been committed in Kashmir and that the government regrets this happened would also help soothe deep psychological wounds.

Policing arrangements: Such an improvement in the human rights environment can be enabled and sustained only if existing policing arrangements in Indian-controlled Kashmir are radically restructured. To begin with, all units of the regular Indian army – many of which are actively engaged in counter-insurgency operations – should be redeployed away from population centres (including rural areas) and reoriented towards their traditional duties of border security. Of the hundreds of thousands of Indian security personnel deployed in the troubled areas of Kashmir in the 1990s, the vast majority have been non-Muslims and non-Kashmiris from outside the province. As a result, the Indian security presence in these areas bears an uncomfortably strong resemblance to a foreign occupation army (a somewhat similar stumbling block to a permanent peace exists in northern Ireland, where the police force, the Royal Ulster Constabulary or RUC, is presently 90 per cent Protestant and viewed as biased and hostile by most Catholics). Along with the redeployment of army troops, these other 'outside' personnel – who make up the vast bulk of counter-insurgency formations such as the Central Reserve Police Force (CRPF) and the Border Security Force (BSF) – should be progressively removed from Kashmir. In parallel, responsibility for normal law-and-order maintenance should gradually revert to a rejuvenated Jammu and Kashmir police composed of local officers.

Political prisoners: As in northern Ireland, the issue of political prisoners is an especially emotive and important one in Kashmir. There are currently some thousands (estimates vary widely) of Kashmiris being held in Indian jails and detention centres for political offenses, many without trial or indeed any due process of law under emergency regulations that should be gradually removed altogether from the statute books. The Indian government should adopt the most generous policy regarding these detainees. Those in prison solely for holding or peacefully expressing pro-independence or pro-Pakistan views should be released immediately and unconditionally, and any charges against them dropped. Those charged for acts of violence not involving fatal attacks against civilians should also have their cases reviewed expeditiously and be favourably considered for the earliest possible release. Those accused of egregious acts of violence against civilians should be brought to fair trial under due processes of law at the earliest possible date. Lenient and accelerated programmes of release should be rapidly implemented for prisoners belonging to those groups which ceased armed activity and/or are observing an unequivocal ceasefire.

Conversely – following a similar reward-penalty scheme currently being implemented by the British and Irish governments and the northern Ireland security authorities – prisoners belonging or affiliated to groups which have failed to put down the gun should not be released.

Dimension III: The Srinagar-Muzaffarabad Axis

The great social diversity of Kashmir, and the sharply conflicting basic political allegiances of different sectors of its population, means that a single independent state of Kashmir encompassing pre-1947 borders would most probably be unviable, even if India and Pakistan were to allow it (which they have no intenion of doing). However, that does not mean that what was the pre-1947 princely state should be condemned in perpetuity to the opposite extreme: which is being divided by an iron curtain, the single most heavily militarised border in the world. Indeed, along with the progressive normalisation of the overall framework of India-Pakistan relations and the gradual normalisation of life and politics on both sides of the Kashmir border (Dimensions I and II), possibilities should open up for not just demilitarising those 800 meandering kilometres of trenches, bunkers and barbed wire, but making it much more porous than it has hitherto been – a linen curtain rather than a barrier of iron and steel. This would be the Srinagar-Muzaffarabad axis – Dimension III of the alternative approach to building peace in Kashmir and the subcontinent.

Dimension III roughly corresponds to Strand II of the northern Ireland peace process, which is considered to be the most contentious element of that peace process's three-track approach to peace-building. Under Strand II of the Good Friday Agreement, a north-south ministerial council is to be established as the institutional expression of cross-border co-operation between Ulster and the Republic of Ireland. This north-south ministerial council – consisting of executive members or ministers from northern Ireland's autonomous, power-sharing government and their counterparts from the Irish Republic's sovereign government – is charged with gradually developing co-operation and eventually common policy on a range of issues of mutual concern. The issues listed include various aspects of agriculture, education, transport, environment, inland waterways, inland fisheries, tourism, social welfare, public health, urban and rural development, matters of a cultural nature, and implementation of European Union (EU) programmes.

Nationalists regard the development of this cross-border institution as absolutely crucial to longer-term prospects of peace in Ireland, since it represents the agreement's major concession to their long-term agenda of unification with the Irish Republic. Unionists, on the other hand, are deeply paranoid about institutions of north-south co-operation, since they conjure up their worst fears of one day being submerged as a minority in an united Ireland. The Good Friday Agreement tries to balance both sets of concerns. Strand II thus makes it mandatory for ministers from the northern Ireland autonomous, power-sharing government – unionist members as well as nationalists – to participate in the functioning and development of the north-south ministerial council. At the same time, the agreement is ambiguous on how much 'teeth' the cross-border institutions will really have, in what might well be a deliberate attempt to allay the fears of unionists, who have in fact already adopted a strategy of stonewalling on the issue as much as possible.

The establishment of a cross-border Jammu and Kashmir council for co-operation with representatives from inclusive, elected and autonomous governments from both sides of the line of control, would serve several crucial purposes. First, it would serve as a mark of respect towards the historical integrity of the state (an issue of importance especially to independents and exemplify the replacement of the iron curtain by a linen curtain, even while leaving the de facto sovereign jurisdictions on either side of the line of control intact.

Dimension III would also serve a second and even more important purpose. A basic aim of Pakistan's Kashmir policy has always been to secure some sort of say, however indirect – a foothold, if you will – in the affairs of the Indian-controlled two-thirds of Kashmir, especially the Valley. Regional institutions of cross-border co-operation, linking Srinagar to Muzaffarabad, would do precisely that – give the part of Kashmir which is under de facto Pakistani sovereignty an institutionalised role, even if limited, in the part of Kashmir which is under de facto Indian sovereignty. However, since there is no such thing as a free lunch in politics, any such arrangement would necessarily involve a quid pro quo and be strictly reciprocal in nature, giving Indian Kashmir an indirect, limited say in the affairs of the other Kashmir across the border. To begin with, the functions of the Jammu and Kashmir council for co-operation should probably be modest, providing primarily a forum for the exchange of information and consultation between popular representatives of the two Kashmirs on a limited range of issue including intra-regional trade and commerce, cross-border transportation, protection and preservation of the local environment, intra-regional waterways, cultural matters, agriculture, and tourism. With time, the potential exists for institutions of cross-border co-operation to be gradually developed in more robust directions.

Conclusion

In 1931, the poet W B Yeats wrote a famous lament to what seemed to be the inescapable fate, through all the twists and turns of history, of his beloved Ireland. It runs like this:

Out of Ireland have we come
Great hatred, little room
Maimed us at the start
I carry from my mother's womb
A fanatic heart.

Ireland has obviously made a lot of progress since then, though not before costly, avoidable detours involving decades of violent confrontation, sectarian conflict, and political stalemate. It is within the realm of the possible that similar progress can in the foreseeable future be achieved in Kashmir. In the best case scenario – which of course is itself a highly optimistic assumption – the kind of multi-dimensional, interlocking approach I have outlined here has the potential to unfreeze a 50 year stalemate.

This approach takes full account of the unavoidable exigencies of realpolitik – the legitimate concern of the Pakistani and Indian states and their elites with basic issues of state sovereignty, national interests and security. The present de facto sovereign jurisdictions in Kashmir cannot and will not change in the foreseeable future. The borders drawn in blood through Jammu and Kashmir in 1947-48 are here to stay – albeit, hopefully in a minimal form in the future – just as those even longer borders drawn in blood between India and Pakistan at the same time are a permanent reality. However, it is still in the interests of both India and Pakistan to find a viable, durable way out of a conflict that saps so many resources, causes so much tension, and which neither country can ever hope to unequivocally 'win'.

At the same time, this approach offers to the frustrated, fractured and utterly demoralised independence movement in Kashmir the prospect of a genuine voice in the making of Kashmir's future and a major role in the operation of its reconstituted institutions of governance. That, whatever its limitations, would not be something insignificant. The alternative, in any case, is even less palatable for all sides involved – a dead end status quo built on obsolete assumptions and ridiculous posturing which normalises conflict rather than peace.

Convergence of Incomes across Indian States

A Divergent View

M Govinda Rao
R T Shand
K P Kalirajan

This article examines the trends in interstate inequalities in the levels of income in India over the last three and a half decades. Contrary to the predictions of neoclassical growth theory that interstate differences in income levels tend to reduce as they approach the steady state equilibrium, our analysis shows widening interstate disparities. To understand the causes of this divergence, the article examines the determinants of interstate differences in growth rates and analyses the role of interstate transfers – explicit and invisible – in determining the geographical spread of investment and incomes. It finds that divergence in income levels has been mainly caused by the allocation of private investments which in turn, has been influenced by the inequitable spread of infrastructure. The inequitable nature of public expenditure spread across states is attributed to the inability of the intergovernmental transfer mechanism to adequately offset the fiscal disabilities of the poorer states as well as regressive nature of the invisible interstate transfers.

I
Introduction

A MAJOR objective of planned developmental strategy in India since independence has been to accelerate economic growth and achieve a balanced regional spread. During the colonial period, the structure of incentives, institutions and the spread of infrastructure were evolved predominantly to serve colonial interests [Bharadwaj 1982], and the planned allocation of resources in independent India was expected to rectify inter-regional disparities and imbalances in development caused by those distortions. After 50 years of planned developmental experience, it is opportune to analyse the extent to which this objective has been achieved.

There are important motivations for undertaking a study of the trends in interstate inequalities in income levels. First, it has been shown that most of the poor are concentrated in poorer and slow growing regions and therefore, analysis of interstate disparities is relevant to evolving an effective strategy to combat poverty. This is particularly true in an economy where the mobility of labour is less than perfect due to various institutional factors. Second, inter-regional disparities have ramifications for the stability of the federal polity. More importantly, economic liberalisation enhances interstate competition and potential gains from competitive federalism depend upon the competitive strength of competing jurisdictions.[1]

The plan of the article is as follows. Section II briefly reviews relevant neoclassical growth theory, examines the issue of convergence in per capita state domestic product (SDP) and tests for the convergence of incomes among the 14 major states in India for the period since the mid-1960s. In Section III, important factors affecting economic growth, particularly the role of private investment, are analysed. The interstate distribution of private investment and its association with public spending are examined in Section IV. Section V examines the role of explicit and invisible transfers in determining interstate distribution of government expenditures and private investments in India. The major findings of the study are summarised in the last section.

II
Incomes across Indian States

(a) Growth and Convergence

Much of the recent discussion on intercountry or inter-regional differences in income levels is done within the framework of neoclassical growth models of Ramsey (1928), Solow (1956), Swan (1956) Cass (1965), Koopmans (1965). These models demonstrate that in closed economies with no differences in technology and preferences, the growth rate in per capita incomes tends to be inversely related to the initial levels of per capita incomes. Barro and Sala-i-Martin derive a log-linear approximation of the steady state model to arrive at the average growth rate with a Cobb-Douglas technology as:

$$1/T.\text{Log}\,[y_{it}/y_{i,t-T}] = x_i^* + \text{Log}\,[y_i^*/y_{i,t-T}]\,[1 - e^{-\beta T}]\,/\,T + U_{i,t} \qquad ...(1)$$

where
i indexes the economy,
t indexes time,
y_{it} denotes per capita income,
x_i^* is the steady state growth rate of per capita income,
y_i^* is the steady state output per effective worker.
$y_{i,t}$ is the output per effective worker (number of workers adjusted to take account of the effect of technological progress),
T is the length of time period,
β represents the rate of convergence, and
$U_{i,t}$ is the error term.

The higher the value of β, the greater the responsiveness of the growth rate to the difference between y_i^* and y. The theory implies that pure differences in the level of technology do not affect β. Thus β can be similar for economies that are very different in other respects.

The model implies a form of conditional convergence and the speed of this convergence is measured by β. Thus, for given steady state values of x_i^* and y_i^*, per capita income growth rate would be higher, the lower the starting level of per capita income ($y_{i,t-T}$). Convergence is conditional because $y_{i,t-T}$ is related y_i^*, which may not be uniform across regions due to differences in the savings rate or technology. However, most empirical studies assume away differences in savings and technology and infer absolute convergence from the estimates of β [Barro and Sala-i-Martin 1991, 1991a]. The principal force driving convergence in the neoclassical growth model is diminishing returns to reproducible capital. Thus, economies with lower initial values of capital-labour ratios will have high marginal products of capital and therefore, tend to grow at higher rates [Evans and Karras 1996].

There is a related but alternative measure of convergence, which essentially

Figure 1: Relationship between Level of Incomes and Growth Rate across Indian States – 1965-95

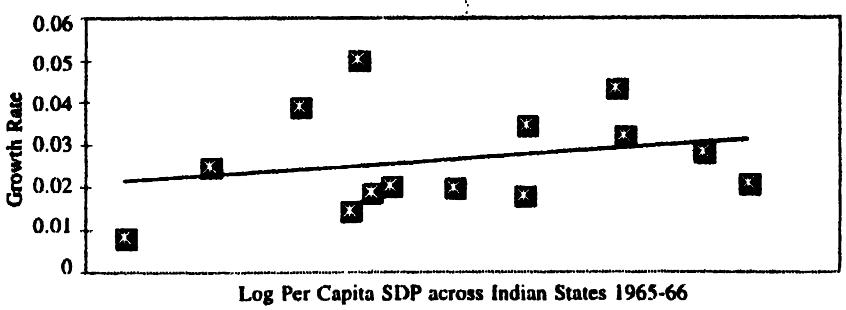

Figure 2: Relationship between Level of Incomes and Growth of Incomes across Indian States – 1975-95

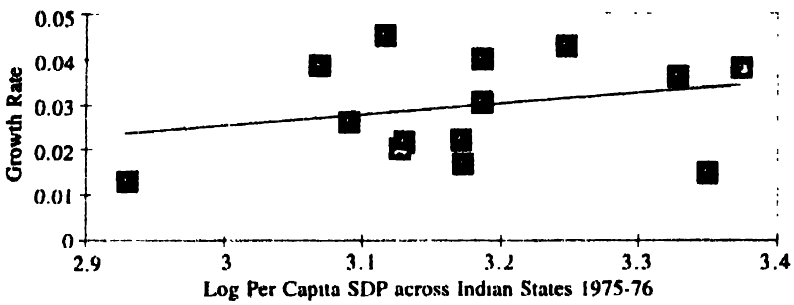

of nét domestic product in the country and are therefore representative. The mountainous states of the north and north-eastern part of India which are considered 'special category' by the Planning Commission and the small state of Goa have been excluded from the analysis because of the significant differences in the structure of their economies from the rest of the states and therefore their steady state values of x_i^* and y_i^* are likely to be different. In most of these states, the only important source of income is government activity.

There are two different sources of SDP estimates. The first is the comparable estimates made by the Central Statistical Organisation (CSO). However, this series is available only from to 1967-68 to 1985-86 and that too only in current prices [Choudhury 1993]. The alternative is to use the estimates of SDP made by the statistical bureaus of each of the states which are compiled and published by the CSO. These data are not strictly comparable
